ISLANDS IN THE SOUTHERN PACIFIC.

BOOK I.—VAN DIEMEN'S ISLAND.

CHAPTER I.

LOCALITY, AREA, DISCOVERY, AND HISTORY.

VAN DIEMEN'S ISLAND, sometimes called *Tasmania*, is separated from the island-continent of Australia by an arm of the sea, about 100 miles broad, termed Bass Strait. In shape resembling a heart, it extends between the parallels of $40^{\circ}45'$ and $43^{\circ}40'$ S. lat., and the meridian $144^{\circ}50'$ and $148^{\circ}30'$ E. long. The length, from South Cape to Cape Grim, is about 230 miles; the breadth, from the Eddystone Point, on the east coast, to West Point, is nearly 200 miles, gradually diminishing to the south point or apex of the island. The area is nearly 24,000 square miles, or about 15,000,000 acres.

This fine island was discovered by the celebrated Dutch navigator Abel Jansz Tasman, who sailed from Batavia, in Java, on the 14th of August, 1642, as commodore of the yacht *Heemskerk*, and the fly-boat *Zeechaan*, with instructions to ascertain how far the "great south land" extended towards the Antarctic Circle.

Tasman touched at the Mauritius, then steered to the southward and eastward, and on the 4th of November, at four P.M., saw high land, distant about forty miles. On the ensuing evening the commodore closed in with the shore, in $42^{\circ}30'$ S. lat., and designated the country *Antony Van Diemen's Land*, in honour of the governor-general of the Dutch possessions in the East Indies. The islands around were named after the different members of the council of the Indies. The vessels skirted the coasts; and on the 29th of November, when preparing to enter a large inlet in the south-east shores, they were driven almost out of sight of land by a violent gale of wind. December 1st, the wind moderated, a council of officers from the two vessels was held, and it was resolved to attempt "to get a knowledge of the land, and some refreshments." The

vessels stood in with an easterly breeze, and came to an anchor, an hour after sunset, "in a good port, in twenty-two fathoms, whitish good holding sand." To the entry which records these facts is added, in the journal of these pious navigators, "*wherefore we ought to praise Almighty God.*"

This port is called *Frederik Hendrik's Bay*, in the chart of Tasman. The Dutchmen remained here until the 4th of December, erected a post with a compass cut thereon, and surmounted it with "the prince's flag, as a memorial to the posterity of the inhabitants of the country;" then proceeding in a north-east course along the coast, on the 5th of December they steered "precisely eastward, to make farther discoveries," conformable to a resolution of the council held that morning. The next land seen by Tasman was New Zealand, to which reference will be made when describing that country. The result of this voyage was not made public by the Dutch East India Company; but Dirk Rembrantz, "moved by the excellency and accuracy of the work," published in Low Dutch an extract of the Journal of Tasman. This was translated into many languages, and republished in the *Complete Collection of Voyages and Travels*, by John Harris, D.D., in London, A.D. 1744.

More than a century elapsed without any European voyager having visited Van Diemen's Land. In 1769, Captain James Cook was sent, in H.M.S. *Endeavour*, to Otaheite, there to observe the transit of Venus over the disk of the sun. After performing this service, he rediscovered New Zealand; then following a westerly course, saw land, which he judged to lie in 38° S. lat., $148^{\circ}53'$ E. long.; but could not determine whether it joined or was distinct from the Van Diemen's Land of Tasman. Cook then pro-

ceeded to the northward to Botany Bay and Cape York, considering, as Tasman had done, Van Diemen's Land a portion of Australia, or New Holland.

In 1772, Captain Marion du Fresne, a French naval officer, was sent in command of two vessels from the Mauritius in search of the supposed southern continent. On the 3rd of March, M. Marion made the west side of Van Diemen's Land in $42^{\circ} 56'$ S. lat., half a degree south of the first land seen by Tasman, and on the 4th anchored in *Fr. derik Hendrik's* bay. Fires and smoke seen by night and day indicated that the country was well inhabited; and on anchoring about thirty men assembled near the beach. The boats went on shore next morning, the natives received their strange visitors without shewing any distrust, and having piled together some pieces of wood, presented a lighted stick, apparently to try if the new comers would set fire to the pile. The French, wondering what might be the meaning of the ceremony, complied with what they considered the wish of the natives, who thereupon expressed no surprise, and remained about them with their wives and children as before, but nevertheless disdainfully rejected the presents of iron, looking-glasses, handkerchiefs, cloth, &c., offered by the seamen. After the first boat had been about an hour on shore Captain Marion landed, when one of the aborigines stepped forward and tendered him a firebrand, at the same time pointing to a small heap of wood. M. Marion thinking, as the sailors had previously done, to conciliate them, set fire to the pile, when they instantly retired to a small hill, and commenced throwing stones, by which M. Marion and the commander of his companion ship were wounded. The French fired some shots, returned to their boats, and coasted along the beach; the natives having sent their women and children into the woods, followed them along the shore, and upon their attempting again to land, sent a shower of spears into the boats, by which one man was wounded. A volley of musketry compelled the natives to retreat with their wounded from this unequal warfare; fifteen men armed with muskets pursued them for some distance, found one of them dying, whom his companions had been unable to carry off, and returned, after traversing two leagues of country, without, with the above-named exception, meeting a native or finding any fresh water. I have mentioned the

peculiar circumstances connected with this first rencontre, because a degree of painful interest is attached to it, as the commencement of a series of distressing and disastrous conflicts between the aborigines and the English settlers, which has terminated in the removal of every native from Van Diemen's Land. My own impression is, that the ceremony of offering the firebrand was intended to convey an inquiry whether the new race were coming to light their fires, or, in other words, to make their hearths and homes in their land; it was answered in the affirmative, and to prevent this they instantly declared war, and waged it ever after "to the death." They appear to have never recognized any distinction between French and English, all white men were to them alike—a blood feud had commenced, which could only be terminated by the entire destruction of one party or the other. M. Marion, not being able to obtain fresh water or masts for his ships, sailed on the 10th of March, 1772, for New Zealand, where himself, four superior officers, and eleven seamen, were massacred and eaten by the savages. In 1773, Captain Tobias Furneaux, of H.M.S. *Adventure* (one of the vessels under the command of Captain Cook), made the southwest cape of Van Diemen's Land on the 10th of March, visited *Adventure Bay*, sailed along the coast to the northward, and after arriving in the parallel of $39^{\circ} 50'$ declared his opinion that there was no strait between New Holland and Van Diemen's Land, but a very deep bay. Furneaux discontinued his northerly course, and steered for New Zealand. In 1777, Captain James Cook, then on a voyage of exploration in H.M.S. *Resolution* and *Discovery* made the southwest cape on the 24th of January, and anchored on the 26th in *Adventure bay*. Cook also failed to discover the insularity of the land. In 1788, Captain Bligh, in H.M.S. *Bounty*, visited *Adventure bay*. In 1789, the brig *Mercury*, J. H. Cox, commander, visited *Oyster Bay* in $42^{\circ} 42'$ S. In 1792, Bruni d'Entrecasteaux, a French rear-admiral, who had been sent with two ships of war in search of La Perouse, entered, as he thought, the *Storm Bay* of Tasman, but which was really the fine channel since called by his name; and after sailing through it for ten leagues to the northward, he found it communicated with the true *Storm bay*, from which it was separated by the long and strangely-shaped island since termed *Bruni* (see topography). After making several

valuable surveys of this part of the coast, the French commander sailed to the eastward. In 1794, Captain John Hays, of the Honourable East India Company Bombay Marine, examined the coast before so frequently visited, sailed some distance up the river called by D'Entrecasteaux the *Rivière du Nord*, which appellation he changed for that of the *Derwent*, and affixed different designations to various other places, which they still retain.

In 1797, Mr. Bass, surgeon of H.M.S. *Reliance*, requested the governor of New South Wales to allow him a whale-boat, and permit him to man her with six volunteers from the ships of war at Sydney Cove, with a view to his exploring the coast to the southward. In this skiff, a little larger than a jolly-boat, and supplied with six weeks' provisions, he sailed as far as 40° S. lat., and after a hazardous voyage of twelve weeks' duration, was compelled by the leaky state of his boat to return to Sydney, which he reached in February, 1798. Colonel Collins states that Mr. Bass "visited every opening in the coast, but only in one place, to the southward and westward of Point Hicks, found a harbour (Western Port,) capable of admitting ships;" and reported that "there was every appearance of an extensive strait or rather open sea, between the latitudes of 39° and 40° S. lat., and that Van Diemen's Land consisted (as had been conjectured) of a group of islands lying off the southern coast of the country.* The point which Bass called *Furneaux Land*, was named by Governor Hunter, at the request of Captain Flinders, *Wilson's Promontory*, in compliment to Thomas Wilson, Esq., of London. Instead of finding the land to the westward of this promontory trending south, to join Van Diemen's Land, it took a directly opposite course to the northward. Mr. Bass regretted that he had not a better vessel, which would have enabled him to circumnavigate Van Diemen's Land.

On the 7th October, 1798, the *Norfolk*, a small decked boat, sloop-rigged, of twenty-five tons burthen, lately sent from Norfolk Island to Sydney, was sent with Lieutenant Flinders and Mr. Bass, of H.M.S. *Reliance*, and eight volunteer seamen, with twelve weeks' provisions, to ascertain whether a strait really divided Van Diemen's Land from Australia.† On the 11th the explorers

anchored in *Twofold Bay*, and quitted it on the 14th. On the 17th they reached *Kent Islands*, in 38° 16' S. lat.; the next morning *Furneaux Islands* were in sight; the ensuing day they anchored at *Preservation Island*; they next landed on the southern end of *Cape Barren Island*. On the 1st of November they were off Cape Portland, Van Diemen's Land, in 40° 43' S. lat., and then proceeded along the north coast of Van Diemen's Land. On the 4th November, the latitude was 40° 55' 25"; longitude, 147° 16' 30" E., when *Port Dalrymple* was discovered, and sixteen days spent in the examination of the harbour, river, and adjacent country, with whose fertility and luxuriant vegetation the explorers were agreeably astonished. So numerous were the black swans, that about 300 were seen swimming within the space of a quarter of a mile square. Wretchedly contrived huts were seen, but no inhabitants or canoes. On the 20th November, the *Norfolk* left Port Dalrymple, and proceeded to the westward, but the wind changing, the vessel was driven back to *Furneaux Islands*, and detained there until the 3rd of December, when the voyage through the straits was resumed. On the 6th of December at ten A.M., they passed *Circular Head*; on the 9th they rounded the north-east point of *Three Hummock Island*, pursued a western course along its north side, saw flights of gannets which they computed at not less than "one hundred million;" subsequently the coast was found to lie nearly due south, no land could be seen to the northward, and a long swell was perceived to come from the south-west, to which the voyagers had been for some time unaccustomed; it broke heavily on a small reef, and was hailed by Flinders and Bass with mutual joy and congratulation, as it announced to them the completion of the long wished for discovery of a passage into what was termed the Southern Indian Ocean. *Albatross Island* was next examined; then *Barren* and *Hunter Islands*, and the steep black head forming the north-west cape of Van Diemen's Land was seen on the 9th, and called by Flinders *Cape Grim*. The wind was then strong at east-north-east, the night dark and tempestuous, and they kept as close as possible under the land, but on the morning of the 10th of December found themselves far to the south-west. At eight A.M., the wind having moderated, the little sloop made sail south-east-half-east, and at

* Colonel Collins' *New South Wales*, published in 1804. P. 443.

† See previous volume on Australia, pp. 367-8.

noon was in $41^{\circ} 13' \text{ S. lat.}$, distant ten miles from the *West Point* of Van Diemen's Land. On the 11th the latitude was $41^{\circ} 13'$, longitude $148^{\circ} 58'$, with a fresh breeze at north-north-east, with which they bore away along the shore at a distance of three or four miles, but with much hazard, as the wind blew fresh at west-north-west. On the 12th of November the latitude at noon was $42^{\circ} 0' 2''$, longitude $145^{\circ} 16' \text{ E.}$, the coast trending to the south-south east, the land mountainous, and losing the uniform character it had hitherto preserved. They continued along the coast on the 13th; passed the *South-west Cape* of Van Diemen's Land, then *De Witt's* or *Maulsuyker's Islands*, subsequently *Tasman's Head*; and on the 15th anchored seven miles above *Betsey Island*, in the entrance to *Frederick Henry*, or *North Bay*. The interval between the 15th and 20th was spent in exploring *North Bay* and *Norfolk Bay*; from thence they proceeded round *Cape Direction*, to the entrance of the *Derwent River*; and on the 25th anchored in an inlet which they termed *Herdsmen's Cove*, where the explorers left the sloop and proceeded up the Derwent in their boat, as they did not suppose there would be sufficient water for the little vessel. On the 29th the sloop was taken up to *Risdon Cove* for refitment.

On the 1st of January, 1799, the *Norfolk* left the Derwent, examined D'Entrecasteaux channel, sailed down Storm bay, passed Cape Pillar on the 3rd, and proceeded to the northward. On the 4th *Maria Island* was sighted; on the 5th, *Schouten Island*; on the 6th, in $40^{\circ} 45' 30'' \text{ S. lat.}$, no land was in sight; on the 7th, in $40^{\circ} 24' 45'' \text{ S. lat.}$, *Cape Barren* was visible, bearing south 76, west five or six miles. On the morning of the 8th, these adventurous navigators were among the islands on the north-east point of Van Diemen's Land, where stock was collected, and, after a providential escape from shipwreck, the sloop then stood to the northward; passed *Cape Howe* with a gale of wind from the south-south-east, on the 9th, and reached Port Jackson at ten p.m., on the 11th of January, 1799. The insularity of Van Diemen's Land was now ascertained, and the governor, in honour of the brave explorer, to whom Flinders generously acknowledged the merit was due, named the newly-discovered channel *Bass Strait*. When the extent of this voyage, and the scanty means with which it was

successfully accomplished, are considered, it appears a feat in itself sufficient to entitle Bass and Flinders to rank among the foremost of the daring and skilful seamen who have won for their country an honourable place in the annals of maritime discovery.

The favourable accounts given by Mr. Bass of the soil, productions, and climate of Van Diemen's Island, and by Lieutenant Flinders, of the fine harbours situated at its northern and southern extremities, determined the governor of New South Wales, Colonel King, to form a settlement there, with a view of providing food for the convicts at Sydney Cove, which it was found Norfolk Island could not supply. Some fear was entertained that the French intended to pre-occupy the island.

In August, 1803, Lieutenant Bowen was despatched from Sydney to the River Derwent, with the *Lady Nelson* brig, in charge of some convicts and a guard of soldiers. *Risdon* or *Restdown Cove*, on the east side of the river, where Flinders and Bass had watered and refitted in the *Norfolk* sloop, was the position chosen; the party was disembarked, and commenced building houses and clearing the land, but on the 3rd of May, 1804, while Lieutenant Bowen was absent at Slopem island, a party of three or four hundred aborigines pulled down the most advanced hut, and assumed what appeared to be a threatening attitude. Lieutenant Moon, of the New South Wales corps, attacked them with the military and convicts, killed, some say twenty—others, fifty—and drove the remainder back into the woods.

Meanwhile, Lieutenant-colonel Collins, of the Royal Marines, had sailed from England in April 1803, on board H.M.S. *Calcutta*, fifty guns, accompanied by the transport-ship *Ocean*, with about 400 convicts, 50 marines, and several gentlemen holding official situations, to form a settlement at Port Phillip (see vol. on *Australia*, p. 574). On arriving, Colonel Collins considered it impracticable to form a colony there, and having addressed Governor King to that effect, was ordered to sail for the Derwent, and take upon himself the chief command. On reaching Risdon Cove, he found the settlers almost starving for want of supplies, and in daily expectation of an attack from the aborigines. Colonel Collins judiciously determined to remove the settlement from Risdon to Sullivan's Cove, near the foot of Mount Wellington, where *Hobart Town* was

established, and named in honour of Lord Hobart, then his Majesty's Secretary of State for the Colonies. Both the military and the convicts endured great privations; in the years 1806-7, being devoid of bread, flour, and biscuit, they subsisted solely on kangaroos, fish, and a kind of sea-weed called "Botany Bay greens."

In 1804, Colonel Paterson, of the 102nd regiment, was sent as commandant, from New South Wales, to form a new colony at Port Dalrymple, on the north coast of Van Diemen's Island. He named the river the *Tamar*, and established, at the head of the western arm, *York Town*; but it proved inconvenient as a seaport, and the settlement was removed to *George Town*, near the coast.

The first settlers on the banks of the *Tamar*, like those of the *Derwent*, suffered many hardships, though happily of a far milder character than those recorded in the history of New South Wales; for the government at Sydney Cove, with every detachment of convicts forwarded to Van Diemen's Land, sent some supplies of food: yet, even four or five years after the colony was formed, sheep sold for ten guineas each. The fertility of the soil, however, speedily became manifest; more and more land was cultivated; the trees were felled; live stock introduced from Norfolk Island and from India, thrived well, and increased with great rapidity; and things soon began to wear an improving aspect. Lieutenant-governor Collins died in 1810: Lieutenant Edward Lord, of the Royal Marines, Captain Murray, and Lieutenant-colonel Gills, of his Majesty's 73rd regiment, successively filled his place, until the arrival, in 1813, of Lieutenant-colonel Davey, as lieutenant-governor. At this period, merchant ships were first allowed to trade to the ports of the colony. The number of free settlers began to increase. On the abandonment of Norfolk Island as an agricultural establishment, the farmers and their families were conveyed to Van Diemen's Island, and located in the district now termed New Norfolk. There were also occasional arrivals from New South Wales: several officers belonging to the marines, and to the regiments stationed in the colony, remained in it, and became landed proprietors, as did also numerous crown prisoners, on becoming

free by servitude or by indulgence. In 1816, Van Diemen's Island commenced its first export of grain to the older colony; and in 1819, the settlement of free emigrants was sanctioned.

In 1817, Lieutenant-colonel Sorell succeeded Lieutenant-colonel Davey as lieutenant-governor, and found, on his arrival, that owing to the mistaken leniency and inefficient policy of his predecessor, "bush-ranging," or, in other words, the marauding of runaway convicts, was spreading ruin and desolation over the island. Proclamations were issued, offering rewards for the death or capture of the seven principal ringleaders, who, within a few weeks, were either made prisoners or destroyed. Of these, the most desperate and utterly depraved was a convict named Michael Howe, who had arrived in the colony in 1812, under sentence of seven years' transportation. He was assigned to the service of one of the settlers, but soon absconded to the woods, and became the leader of a set of desperadoes, who pursued a career of robbery and murder. Mutual distrust and jealousy springing up among these wretches, Howe left them, and wrote to Colonel Sorell, offering to give himself up on receiving an assurance of personal safety, and the promise of a favourable representation towards obtaining a pardon from the governor-in-chief at New South Wales. This was acceded to, and Howe quietly surrendered; but in three months he contrived to elude the vigilance of his keepers, and again took to the woods, where, shunned as a traitor by the majority of his old associates, and proscribed by the government, he pursued a fearful career of crime, taking a fiendish delight in murdering all who came within his grasp. His gang consisted of fourteen men, all armed, and two native women, also armed. This monster, having at one period separated from his party, for fear of betrayal, was accompanied by a native girl who had been his faithful companion; being hard pressed by the troops, he fired at the girl in order to facilitate his own escape. She, however, received little injury, fell into the hands of the soldiers, and afterwards became very useful as a guide to the military in tracing the footsteps of the bush-rangers among the woods, where Europeans could see no mark.* For fifteen months

* A circumstance illustrative of the keen sight and sense possessed by the Australian savages occurred while I was in New South Wales, and the accuracy

of the following narrative has been attested by Saxe Bannister, then his Majesty's attorney-general for the colony, and by other gentlemen. It was re-

the outlaw successfully defied all efforts for his capture; but at last, the reign of terror which he had maintained for nearly six years, was closed by his being beaten to death with the butt-ends of the muskets of two men, viz., Pugh, a private of the 48th, and Worral, a convict, who laid in wait at a hut on the Shannon river, which Howe was induced to enter by the representations of a person named Warburton, who being engaged in hunting the kangaroos for their skins, was occasionally brought in contact with him. Thus the robber and murderer who had disgraced humanity by a career of far worse than brutal cruelty—hunted and trapped—died the death of a wild beast, escaping (in some sense) the last penalties awaiting him from the offended laws of his country, only to appear before that awful tribunal, to which he had been the wretched instrument of hurrying so many immortal souls—there to answer for blood shed, and misery inflicted, in the very wantonness of vice.

To return to the affairs of the colony. In marked that a settler living in a comfortable station on a small farm, near the Great Western road to Bathurst, had not for some time been seen about his grounds, or at market. The convict overseer in his service circulated a report that his master had privately and suddenly left the country and proceeded to England, leaving the property in his charge. This was thought extraordinary, as the settler was known to be a steady, prudent, and thriving individual. The overseer, however, told the story so plausibly that it was pretty generally believed by the neighbours. Several weeks elapsed, and the subject was almost forgotten, when one Saturday night a neighbouring settler returning from market with his horse and cart, on arriving at the paling which separated the missing farmer's land from the high road, thought he saw the very man sitting on the rail or fence. Instantly stopping, he hailed his long absent neighbour, enquired where he had been, and when he had returned home; receiving no answer, he dismounted from the cart and went towards the fence; upon which his neighbour (as he plainly appeared to be) quitted the fence, and crossed the field towards a pond in the direction of the house, which he was supposed to have deserted. The farmer thought it strange, remounted his cart, and proceeded home. The next morning he went to the cottage, expecting to see his friend; but saw only the overseer, who laughed at the story, told the farmer that he had probably taken a drop too much at market, and said that his master was by that time near the shores of England. The impression made upon the mind of the farmer was nevertheless so vivid, that he proceeded immediately to the nearest justice of the peace (I think it was to the Penrith bench), related the preceding circumstances, and added that he feared there had been foul play. A native black, then attached to the station as a constable, was sent with some of the mounted police, and accompanied the farmer to the rail where the latter thought he had seen, on the previous evening,

February, 1820, Mr. Bigge arrived as commissioner of enquiry, after completing his investigations at New South Wales. The reports of the commissioner led to several important alterations in the internal affairs of the settlement; among others, the regulation by which *bona fide* growers of corn could, at all times, receive ten shillings per bushel for it from the commissariat, was abolished, and the wants of government for the support of the prisoners and the troops was, in future, laid open to competition by public tender.

The deservedly popular administration of Lieutenant-colonel Sorell closed in 1824. He found the island a wilderness in 1817, inhabited by a comparatively small and inferior class of free persons: "he left it," says a well-informed local historian, "possessed of commerce, buildings, roads, bridges, a number of wealthy emigrants, and the inhabitants wearing the appearance of prosperity."* The colonists subscribed £750 (no individual being allowed to contribute more than two dollars), for the purpose of

his missing friend. The spot was pointed out to the black, without showing him the direction which the lost person apparently took after quitting the fence. On close inspection, a part of the upper rail was observed to be discoloured; it was scraped with a knife by the black, who smelt and tasted it. Immediately after, he crossed the fence, and took a straight direction for the pond near the cottage; on its surface was a scum, which he took up with a leaf, and, after tasting and smelling it, declared it to be "*white man's fat*." Several times, somewhat after the manner of a blood-hound, he coursed round the lake; at last he darted into the neighbouring thicket, and halted at a place strewn over with loose and decayed brushwood. On removing this, he thrust down the ramrod of his musket into the earth, smelt at it, and then desired the spectators to dig there. Instantly spades were brought from the cottage; the remains of the settler were found, and recognized; the skull was fractured, and the body presented every indication of having been some time immersed in water. The overseer was committed to gaol, and tried for murder. The foregoing circumstantial evidence formed the main proofs. He was found guilty, sentenced to death, and proceeded to the scaffold protesting his innocence. Here, however, his hardihood forsook him: he acknowledged the murder of his late master; declared that he came behind him when he was crossing the identical rail on which the farmer fancied he saw the deceased, and, with one blow on the head, killed him—dragged the body to the pond, and threw it in; but, after some days, took it out again, and buried it where it was found. The sagacity evinced by the native black was remarkable; but the first indication to the farmer of the spot on which the murder was committed, is to me the most singular interposition of Providence that ever came within the limit of my own immediate observation.

* *Van Diemen's Land*, by Henry Melville, published at Hobart Town in 1833.

presenting to the governor a piece of plate, and addressed the crown, praying that he might be continued in office; but the usual period of six years allotted to a governor having expired, his Majesty's ministers deemed it advisable, at this important epoch in the colony, to send out an officer of tried firmness of character, under whom various administrative reforms could, it was considered, be more effectually carried into operation than by an old-established governor. The retiring governor received a pension of £500 per annum from the colonial revenues.

The new ruler arrived at Hobart Town in May, 1824, and soon found himself surrounded with difficulties: the colonists (to borrow a phrase more expressive than elegant, from the Americans), had been "going a-head too fast;" a reaction had commenced; mercantile depression, depreciation of property, and diminution of public confidence followed: distress brought discontent in its train; party spirit, so frequently the bane of a colonial community, occasioned much bitterness of feeling; and to add to the public distress, bush-ranging recommenced, and fearful atrocities were of frequent occurrence. The daring and ferocity of the bush-rangers are the theme of several popular narratives, and many of the wildest and most romantic scenes of Van Diemen's Island are associated in the minds of the people with some, now happily traditionary, exploit. The proceedings of one of the most celebrated of those lawless bands will convey some idea of the disturbed state of society which they occasioned. In 1824, fourteen desperate convicts, of whom the leaders were Crawford, Brady, Dunne, and Cody, made their escape from the penal settlement at Port Macquarie in a whale-boat. They coasted the south-west shores of the island, living on shell-fish, &c., and ultimately reached the shores of the Derwent river, where they landed, and were soon joined by numerous associates, provided with arms, and other necessities. Crawford, a clever Scotchman, said to have been formerly a lieutenant or mate in the royal navy, organized and disciplined this gang of freebooters, who soon filled the respectable colonists with alarm. One of their earliest attacks was directed against the mansion of Mr. G. Taylor, of Valley-field, on the Macquarie river, situated on a gentle eminence, commanding a view of the river and open plain. The banditti mustered thirteen; the

family consisted of the venerable old gentleman (in his seventy-fourth year), three sons, two daughters, besides a carpenter and another free servant. While the robbers were advancing, they made prisoner of the youngest son of Mr. Taylor, whom they placed in front, denouncing his family, and threatening his immediate destruction if they were opposed. The gallant veteran, despite the disparity of numbers, and the fearful position of his son, sallied forth, accompanied by his two sons and servant, to give battle: the carpenter, who was working at a distance, hearing the alarm, attempted to return to the house, but was bayoneted by one of the gang. When the firing commenced, young Taylor, who was close to Crawford, the leader, sprang upon him, and endeavoured to hurl the ruffian to the ground. Both being powerful men, the struggle lasted some time, when Mr. Robert Taylor, fearing for the result, fired his musket, loaded with slugs and buck-shot, taking aim, as well as he could, at Crawford, who received part of the contents in his body—the remainder took effect on the shoulder of young Taylor. The fearful contest was kept up for a considerable period, the ladies charging the fire-arms of their father and brothers, and the whole party fighting for life, and more than life, since the treatment defenceless females were likely to receive at the hands of these wretches, was more to be dreaded than death itself. At length the bush-rangers were compelled to retreat, leaving Crawford and two of his gang on the field dangerously wounded; they were handed over to justice, and perished on the scaffold. Young Taylor partially recovered, but was subsequently killed by the aborigines, and his brave-hearted father did not long survive him.

The command of this desperate gang devolved on Brady, whose name operated like a spell in giving confidence to the bush-rangers, and whose rapid and daring movements struck terror into every part of the island. For nearly two years this Tasmanian brigand, who made it his boast that he "never wantonly sacrificed human life, and never outraged female delicacy," set every effort for his capture at defiance, and his traits of generosity and reckless daring threw a *prestige* around even his worst actions, which among the less depraved convicts rendered his example really more injurious, because more alluring than the

hideous and unalloyed vice before manifested by Howe.

The reception which Mr. Taylor had given to the bush-rangers was not lost upon Brady; the maxim he adopted was never to fight except "upon compulsion," or at least what he considered such, and the superior knowledge of the bush possessed by the brigands, together with the information acquired by their scouts scattered all over the country, and that obtained from their numerous allies among the convict servants assigned in private houses, enabled them to outgeneral every military or police movement. The Shannon district, with the extensive uninhabited district of St. Patrick's, Arthur's Lake, Lake Echo, and Great Lake, had been ever the favourite resorts of the bush-rangers, who closely imitated the dress of the soldiers, which consisted when in the bush of a grey jacket and trowsers, trimmed with fur, kangaroo-skin knapsack, opossum-skin cap, and kangaroo cartouche box—hence mistakes arose on the part of the troops, which had, for them, too frequently a fatal termination. Several of Brady's feats savoured more of the highly-coloured adventures of the hero of a melodrama than of the dry hard life of an escaped felon, engaged in procuring by theft a precarious subsistence; that such a mode of existence, while rendering him utterly callous to its consequences, had not eradicated all trace of better feeling is much to be wondered at.

Among the many tales rife among the colonists at this period, the following is perhaps the best example of the strange mixture of personal daring, impudence, ready wit, and want of principle or sense of infamy, which marked the character of this "popular villain."

Brady with his gang had possessed himself of the premises of Mr. Robert Bethune, at Pitt-Water, on a day when that gentleman was expecting visitors from Hobart Town. In due time the unconscious guests arrived, being received with all respect by the robbers, who took their horses and ushered them to the dining-room, where they did the honours with perfect gravity, some time elapsing before the gentlemen became aware of their actual position. In the plunder which ensued Mr. Walter Bethune was deprived of a brooch containing some hair, which was restored by Brady with the remark of—"Some love-token, perhaps, which I should be sorry to deprive any gentleman of." Dinner over, the guests,

and other captives, to the number of eighteen, were tied together two and two, and then *marched to the gaol at Sorell*, which they reached just as Lieutenant Gunn's party of soldiers, who had been out the whole day in quest of the outlaws, were in the act of cleaning their firelocks. Their surprise consequently was complete, their arms were seized upon by the enemy, and they themselves thrust into durance. The gaoler having escaped, fled to the abode of the district surgeon, where he found Lieutenant Gunn, who had retired thither after his day's march; immediately resuming his arms, he was leaving the house, when he encountered several of the gang, at whom, while taking aim, he received the contents of a musket in his right arm. Several shots were fired, and Captain Glover, a retired officer, on approaching the scene of action, was disarmed and incarcerated with the rest of the prisoners. The main body of the bush-rangers then withdrew, leaving a sentry posted, to whom they gave most sanguinary injunctions in the event of the prisoners attempting to escape, but desired him to respect their captivity should it be borne patiently. Some hours after dawn the gentry and soldiers who were in the gaol suspecting that the sentry was asleep, rushed upon him, and found their redoubted antagonist to be only a bundle of sticks, invested with a military great coat, cross belts, arms "ordered," and bayonet fixed. The military at this period consisted only of two or three small detachments, and there was then no effective police. Large rewards were in vain offered for the capture, or for the heads of the robbers. The contributions levied upon the settlers enabled the leaders to purchase connivance, and the residents at outstations feared to become marked men, by aiding in the attempts at capturing the ringleaders; some of the small settlers, it is stated, not only supplied the gangs with provisions and ammunition, but kept them acquainted with every plan projected for their apprehension. This alarming disorganization went on increasing for two years, until life and property beyond the immediate vicinity of the towns became insecure. Being well mounted the bushmen traversed the island with wonderful rapidity, and when a detachment of soldiers had left some gentleman's residence, hearing of the robbers at a distance, the brigands, deriving their intelligence from the convict servants, pounced upon the defenceless mansion, and rifled its contents.

Pecuniary reward proving insufficient to procure the capture of the bush-rangers, who possessed secure retreats in the mountain fastnesses and secluded dells of the island, Colonel Arthur obtained permission to offer a boon, in which he could have no competitor; namely, free or conditional pardons, and tickets of leave, with, in certain cases, in addition to pardon and pecuniary reward—a *free passage to England*. The hope of liberty proved an all-powerful stimulus, in a few months the whole party being captured, destroyed, or dispersed. Lieutenant Williams, of his Majesty's 40th regiment, with a strong detachment, came suddenly on Brady and his gang; after a brief contest the latter were worsted; Brady being wounded, was soon taken prisoner, and with five other bush-rangers, executed at Hobart Town.

Dunne, Cody, the ferocious Williams, and the sanguinary Murphy, for a time kept the bush, plundering, and too frequently murdering all who came within their reach; but treachery and the hope of reward soon did their work; life-and-death struggles took place, many were slain in the field, some died of their wounds in the hospitals, others, to the number of six or eight at a time, perished on the scaffold, and the advice generally given to the bystanders was—"My lads, never take to the bush, it is a bad game, and now quite done up; but if any of you should be such fools, be sure you murder the assigned (convict) servants—they are a devilish deal worse than their masters."

Although bush-ranging has since been occasionally attempted, it has not lasted long; villains know by experience they cannot trust each other, and to their many crimes treachery is almost invariably superadded; "honour among thieves" signifying simply, mutual connivance while it is convenient.

Between January 3rd, 1822, and May 16th, 1827, more than 120 prisoners absconded from the penal settlement at Macquarie Harbour; with two or three exceptions, the whole perished, being either hanged as bush-rangers, shot by the hands of the military, or famished in the woods, where some of them were reduced to such fearful extremities as led them to add to their previous offences against divine and human laws, that most outrageous to both—*cannibalism*. Of this, one fearful and only too well authenticated instance will suffice. Two convicts named Alexander Pierce and

Robert Greenhill absconded with six others, September 20th, 1822, with a view of endeavouring to reach the settled districts. After about ten days' travelling in the woods, Greenhill and Pierce agreed to murder one of their comrades named Dalton, and eat him. Greenhill slew the victim with an axe, and he was eaten by the party; after a few more days' travelling, Greenhill, with the concurrence of others, killed another comrade named Bodenham, and he was eaten. The next sufferer, John Mather, seeing that he was doomed, asked and obtained life for half-an-hour to pray, after which he was destroyed, and his body served for about six days for the remainder of the party, excepting two, named Brown and Kennelly, who, after seeing the murder of Mather, returned to Port Macquarie, where they died of exhaustion in a few days. Of the three remaining murderers, one named Matthew Travers was the weakest,—he was soon destroyed, part of him eaten, and the remainder dried and divided between Pierce and Greenhill, who by this time had crossed the third tier of Western Mountains, and arrived at a delightful part of the country covered with long grass, and abounding in kangaroos and emus, which they were unable to catch. The demoniac feelings of these two cannibals, each eyeing the other, and watching the opportunity to slaughter and devour him, offers a most horrible picture of the depths of degradation to which even civilized nature may descend. Pierce, in his deposition,* declared himself to have been haunted by the expression of one of his murdered comrades—"Greenhill would kill his father before he would fast one day;" and afraid to sleep or walk before him, he added that he thought for two days that Greenhill "eyed him more than usual;" he kept the axe, the instrument of such terrific deeds, under his head at night, and carried it constantly on his back in the day-time. After a few days passed in this manner, Greenhill fell, overcome with fatigue; Pierce instantly slew him, and travelled on, bearing with him the thigh and arm of his late associate. On reaching the settled districts, he caught a lamb and ate it raw, joined a gang of bush-rangers, and after a short time was taken prisoner and sent to Hobart Town, from whence he was again transferred to Port Macquarie. On the 16th of November,

* Report on Transportation, House of Commons, 3rd August, 1833. Appendix, p. 313.

1823, Pierce persuaded a prisoner named Thomas Cox to abscond, and proceed towards Hobart Town. When they had travelled three days' journey from the settlement, and while they had still some pork, bread, and fish remaining, Pierce murdered Cox, eat a considerable part of him, which, he said, was preferable to any other food, and then, as he declared in his confession, became "so horror-struck at his inhuman conduct," and so confounded, that scarcely knowing what he was doing he made a fire on the beach, which being perceived from the pilot station, and also from the settlement, led to his speedy seizure, which he made no effort to avoid, but voluntarily directed his capturers to the spot where he had left the mangled remains of his victim. When brought back to the settlement he had on the clothes of the murdered man, and a piece of his flesh in his pocket. Pierce was sent to Hobart Town on the 21st of November, 1823, tried for the murder of Cox, found guilty, confessed his crimes, and was executed.

I pass now to another subject, not entirely unconnected with the preceding, which, though less horrible in its details, must, to the mind of the philanthropist, be fraught with yet more painful interest. The fate of the aborigines of Van Diemen's Island, as of too many British Colonies, forms a distressing chapter in the history of the human race; and although it is true that entire nations have become extinct, in some instances, without any direct hostile proceedings on the part of their successors in the land, and like various species of animals and vegetables once abundant, have given place to a distinctly different class; in the present case the influence has been actively not passively injurious.

Van Diemen's Island, when visited by various early navigators, was comparatively thickly peopled by several thousands of a dark-coloured aboriginal race, differing in some respects from the aborigines of the adjacent island of Australia, being of a darker hue, with woolly instead of long hair, a more extreme facial angle, and with the features of the Papuan and the African negro; the limbs were attenuated, and the hands and feet small. The upper jaw, in children, projected considerably beyond the lower, but fell back with age; in the adult it was nearly in the same line. At Adventure Bay the males had their bodies tattooed, and their hair powdered with ochre. The front teeth were not drawn,

nor the first joint of the little finger cut off, as is the case with most of the Australian aborigines. Both sexes went entirely naked, except during the winter season, when kangaroo skins were occasionally worn. Their habitations consisted of three sticks stuck in the ground, and meeting in a point at the top, where they were fastened by a cord of bark, the sides interlaced with wicker-work, and the whole covered with bark or with long grass. Household utensils were unknown; the canoe consisted of a few pieces of wood lashed together like a catamaran.

The women of Van Diemen's Island were a better-looking race, with more agreeable features, and more cleanly persons than those of New South Wales. They frequently became attached to English sailors stationed in the islands in Bass Straits to collect seals, and proved affectionate, faithful, and useful, appearing happy to escape from the tyranny and hard labour imposed by their aboriginal husbands. The children by an European father and native mother are really handsome, of a light copper colour, with rosy cheeks, large black eyes (the whites tinged with blue), long dark eyelashes, fine teeth, well-proportioned ^{and} robust limbs. The male natives, though under other circumstances manifesting much natural affection and kindness to children generally, destroy all those of the half-caste, whenever they have the power; but the women evince the most passionate attachment to those children, and have been known to rush into the fire, and, at the hazard of their own lives, rescue the babe which the savages had committed to the flames. While the sealers were necessarily absent on their hunting expeditions on the islands for several days together, their native wives would continue for hours pouring forth a kind of hymn imploring the Deity whom they believe to be the giver of all good, that he would send back the wanderers with speed and safety. This invocation was accompanied with considerable gracefulness of action, and uttered in harmonious cadences.

The use of the bow and arrow was unknown; as also the throwing-stick and boomerang of the Australians. Their spears were composed of a piece of wood pointed by a sharp stone and hardened by fire, which was obtained by the rapid friction of touchwood. Their weapons, however, though in themselves not very dangerous,

were nevertheless kept in constant employment. Each tribe claimed exclusive possession of a hunting tract, whose limits being by no means clearly defined, occasioned murderous and almost incessant hostilities. Some tribes were more savage and mischievous than others, but the leading characteristics of them all would seem to have been, but too generally, untameable fierceness, treachery, and revenge; these evil passions, however, we must not forget, were fearfully developed by the circumstances of their position. The blood feuds commenced by the natives with the French navigator, Marion, and continued in 1803 with the first British settlers on the Derwent, were fearfully fomented by their being brought in contact with a class of men whose so-called civilization rendered them dangerous and unscrupulous as adversaries, and whose vices totally incapacitated them from pursuing towards the savages the course which—setting aside all better springs of action—common prudence would have dictated.

There can be, unfortunately, no doubt that the runaway convicts, the prisoners working on the roads in gangs, and in some instances, the "ticket-of-leave men," residing in the interior, carried on a constant and brutal warfare with the aborigines; invaded their hunting grounds, massacred whole tribes in order to carry off their women, and shot down a savage in much the same spirit in which they would have killed a tiger; this induced terrific reprisals—the infuriated natives, incapable of distinguishing between friend and foe, treated every white person as a deadly enemy; the traveller was waylaid and put to a cruel death—the settler was speared on his farm—the corn-stacks were fired—frequently, also the dwellings—desolation was spread over the country, and an exterminating warfare ensued, which could only terminate with the utter destruction of one race or of the other.

In 1817 Lieutenant-governor Sorell issued a proclamation declaring all the aborigines to be British subjects, and under the protection of his Majesty's government, with a view of stopping the practice of shooting at them. Their hostility is said to have been greatly increased by a native named *Mosquito*, who had been employed to track the bush-ranger, Michael Howe, and his associates. *Mosquito*, on being jeered and insulted by the convict population, for the

services thus rendered, returned to the woods, became chief of one of the most ferocious tribes, whom he instructed in every villany, and after committing many murders, was at length taken and executed. Women, children, and remote stock-keepers, fell under the unerring spears or waddies of the savages, who inflicted on the corpses of their victims enormities too revolting to be narrated. Sometimes the women were sent to a house to ask for bread or "bacca," and having ascertained the strength, or rather weakness, of the inmates, gave the preconcerted signal, and instantly the hills around were covered with the savages, who sped to the work of murder and rapine with the celerity of lightning; at other times, they would lie concealed among the charred fallen timber and blackened tree stumps, and when the unwary travellers were passing, suddenly start erect like demon ministers of death. In the more early stages of their hostility, a tribe would approach the Europeans seemingly unarmed, and assuming a pacific appearance and supplicating gesture, make their stealthy advances with the fatal spear drawn along the ground securely fixed between their toes.

The difference between a double and a single-barrelled gun was well understood, and if they succeeded in provoking an European to throw away his fire, they would speedily "*rush*" their antagonists, and with their waddies make death the certain issue of the conflict. They were also well aware of the edict made for their protection, and on one occasion, when they approached a hut where there was only one stock-keeper, upon being warned off with a threat of being fired at, if they came nearer, the reply of the leader is said to have been, "*You dam convict—you dam white—you shoot a me—gubberna hang you.*" Upon this, with a loud yell they fearlessly approached; the convict, however, judging the immediate danger to be the greater, fired a ball through the head of the chief, who was borne off by his companions, but not until another fell a victim to the unerring aim of the herdsman, who then reloaded, and pursued the flying foe; but while absent, some of the aborigines entered the hut, plundered it, and carried off a quantity of arsenic used for the destruction of vermin. The effects of the poison were not traced further, than that the blacks were seen drinking at the river in an extraordinary manner. Not unfrequently, the

defenceless stock-keepers were rescued from being murdered by the aborigines, by the timely arrival of bush-rangers armed to the teeth, who poured a deadly volley among the assailants.

There are so many accounts of their atrocious cruelties extant, that the following instance of compassion deserves to be placed on record. An elderly shepherd confined by illness to his hut, while being tended by the wife of one of his comrades, was suddenly alarmed by the fearful native yell of onslaught. The door and window were instantly closed; but a fiery spear directed at the thatched roof, set it instantly in a blaze. The old man desired his kind nurse not to stir, adding, "the blaze will be seen, and help may arrive." For a while she endured the heat and smoke; but when the showers of hot ashes had ignited her dress, she exclaimed, "Let me go, Clarke; better to perish at once by their spears, than consume piecemeal." On opening the door every spear was poised against her; uttering a piercing scream, she threw herself at the feet of the foremost of the savages; he looked at her for a moment, motioned to his companions to desist, tore the burning embers from her neck and hair, and rapidly uttering, "*Parawa—parawa*," pointed out to her the way of escape, which she, half wild with terror, instantly took. While this scene was occurring, a constable in charge of a female convict, chanced to be passing near the spot, and did not discover the vicinity of the savages, until he found himself close to them. He whispered to his companion to speed on in silence, but her fears mastered her prudence, and she uttered a loud and fatal shriek; the constable, unable to quiet the girl, fled—was hotly pursued, but saved his life—the girl fell instantly, pierced with wounds, and was buried with the remaining portion of the shepherd, who with his hut, was almost reduced to ashes. The number of Europeans who thus perished, must have been considerable; they were of all ranks and classes, and the daring of the aborigines became so formidable, that military detachments were obliged to be stationed on several properties, for the protection of the families of the proprietors.

In 1830 it became absolutely impossible to permit the desultory warfare between the isolated colonists and the wandering aborigines, so fatal to both, to continue; and a plan was formed and carried into execution,

of forming a line of troops, convicts, and colonists, across the island, and gradually moving, without breaking the chain, towards Tasman's peninsula, preceded by various skirmishing parties, who kept up an occasional firing and noise, as if they had been engaged on an elephant hunt. The march lasted two months—was borne well by all parties; but, from the rugged and broken nature of the country, the aborigines escaped to the rear of their pursuers, and when the extended line closed in at the entrance of Tasman's peninsula, the sole captive acquired by so much toil, and at an expense of £30,000, was a *little half-starved boy*!

When the united efforts of the government and of the colonists had failed in effecting the capture of the aborigines, an individual named Robinson, not gifted, apparently, with particular abilities or superior address, offered his services to Lieutenant-governor Arthur, declaring his belief that he and his colleagues could bring all the savages to terms, induce them to submit voluntarily to British authority. After some negotiations relative to the provision to be secured to his family, in the event of his perishing in the attempt, and the stipulation, if he succeeded, of a situation as protector of the aborigines, with a salary of about £200 a-year, his propositions were assented to. With Mr. Batman and a few other European associates, he penetrated the fastnesses into which the savages had retired; and having, through the medium of some partly domesticated aborigines, communicated to them his errand as a peace-maker, he so far conciliated them by persuasion and promises, aided by various small gifts, as to induce tribe after tribe to follow him to Hobart Town, where he placed them under the charge of the government. Every attention was paid to their necessities, and great pains taken to relieve them of the loathsome cutaneous disease under which many of them laboured; consequent, doubtless, upon their complete exposure to every vicissitude of weather, upon insufficient, and too often, most unwholesome food; but, more than all, upon their filthy habits. According to the statements of the aborigines themselves, the number still remaining in the woods was very small, yet the whole of those assembled in Hobart Town—men, women, and children—amounted to little more than 200; a melancholy proof of the exterminating warfare which must have been carried on by the

settlers, since the ordinary effects of the presence of the civilized man in the land of the savage—injurious as they have unhappily, too generally been—could not alone account for so rapid a decrease in a population which, according to the early discoverers of the island, had appeared very considerable.

It now became necessary to determine what to do with the natives, and after much deliberation, the plan deemed most conducive both to their welfare and that of the colonists, was, to convey them to Flinders' Island; this was accordingly done, the poor creatures seeming, to some extent, reconciled to their banishment—though, during the whole passage, they sat on the vessel's bulwark, shaking little bags of human bones, apparently as a charm against the danger to which they felt exposed.

A party of aborigines, supposed to be the last remnant of the ill-fated Tasmanian race, were taken, in 1842, by some sealers on the western coast; a reward of £50 having been offered for their apprehension, on account of some depredations that they were said from time to time to have committed. They were induced, by the representations of a countrywoman of their own—the wife of one of the sealers—to enter a boat under the pretence of being taken to some good hunting-ground; but when they were all afloat, and prostrated by seasickness, the sealers made sail for the station of the Van Diemen's Land Company at Point Woolnorth, from whence they were conveyed to Flinders' Island by Captain Stokes, to join their brethren, who then numbered only fifty-four individuals, three-fourths of the original number having perished, and the additions by birth having been but fourteen. In 1848 (31st December), there were stationed at *Oyster Cove*, on *Maria Island*, south-east coast, to which the remnant had been removed from Flinders' Island, twelve men, twenty-three women, and one male child, of pure aboriginal blood; they are fed, superintended, and educated by the colonial government, at an annual cost of £2,100, exclusive of the charge for seven children who are educated at the Queen's Orphan School. Of those at *Oyster cove*, five can read and write, ten can read only, and twenty-one are totally uneducated.

I have thus stated plainly and briefly, our dealings with the aborigines of Tasmania. It is worse than vain to deny, that as a Christian nation, the responsibility we voluntarily

incurred with regard to them was, in the first instance, either grievously misunderstood or wilfully disregarded; nor can we now, looking back upon the whole of our proceedings with them, contemplate without feelings of remorseful regret, the melancholy picture of these wild children of the woods pining rapidly away, in what to them must seem dreary captivity.

Of all the Australian natives that I ever met with, the Tasmanians appeared to me the least susceptible of intellectual cultivation, and the most obnoxious to civilization in any form; consequently, even while receiving as its effect, the abundance of food, warmth, and shelter, which in a state of freedom they must have so frequently been unable to procure, their roving instincts would naturally lead them to yearn with feverish restlessness after their old haunts, and the wandering habits of their early life. Whether by a different system having been pursued from the very commencement of European colonization in the island, they might not have been so far conciliated as to dwell peaceably in territory duly allotted to them, is a question which, so far as this island is concerned, it is useless to ask; but the lesson dependent upon it is a most important one to a nation whose peculiar mission would seem to be colonization. The answer is only too readily furnished by the ease with which the aborigines were brought to listen to the negotiations of Mr. Robinson; and in the case of the Port Phillip natives, by Mr. Batman (see div. iv. p. 575). I do not mean to deny that great difficulties are necessarily attendant on the intercourse of civilized and savage man—difficulties which, I verily believe, the wisdom of practical Christianity on the part of both the legislature and the colonists, can alone successfully combat; neither do I believe any line of policy likely to prove eventually successful in preserving these wild races, whose extinction—from some inscrutable law of their Creator and ours—seems inevitable; but if it be so, is it not the more incumbent on those who are, however regretfully, in some measure the instruments of their fate, to do all in their power to ameliorate it, to evince towards them all possible forbearance, and to make every attempt to dwell peaceably with them in the land from which they are passing rapidly away.

In the case before us, the demoralized state of the convict population must have

rendered the position of the local government, however desirous of securing the welfare of both races, a very arduous one; but it must, I think, be admitted, that if the attempt of coming to terms with the aborigines had been made at a much earlier period, the tranquillity of the colony might have been secured in a more satisfactory manner; and the guerilla warfare, with its fearful sacrifice of life and property, and disorganising influences, might have been to a great extent prevented.

I now resume chronologically the details of the principal occurrences.

In December, 1825, Van Diemen's Land was officially declared an independent colony, and formed into a distinct government. Hitherto its legislative proceedings had been superintended by the government of New South Wales; but for the future the settlement was to be subjected to the direct control of his Majesty's Secretary of State for the Colonies. The introduction of a supreme court of judicature was coeval with the commencement of the administration of Colonel Arthur. This able officer efficiently organized the different governmental departments, apportioned to each its proper duties, and established an excellent system, which might be taken as a model by other colonial governments. His Excellency, in 1827, divided the island into several police districts, and placed each under the charge of a stipendiary magistrate, who had under his control a certain number of "field police" and of mounted policemen.

The practice of allowing the unpaid magistrates various petty indulgences, in the shape of rations, clothing, &c., was abolished; and the savings were appropriated towards carrying out a more effective police system.

Among other useful measures, was that of putting aside a monetary system introduced during the administration of Governor Macquarie, which, though not without its advantages at that period, was becoming more and more inconvenient. In consequence of the scarcity of the circulating medium (then almost limited to dollars and copper coin), and to prevent its being conveyed out of the colony, the "holey dollar" and "dump" had been invented. A piece being struck out of the centre, and called a "dump," passed current at 1s. 3d., and the rim at 3s. 9d. Though the *sterling* value of the Spanish dollar was only 4s. 4d., it was in this manner made to represent 5s. *currency*. Again, an

English sovereign was worth 20s. *sterling*, or 23s. *currency*. This caused great confusion, until matters were set to rights by the introduction from England of the current British coin, the reinstatement of the dollar at its fixed value, and the formation of sound banks of issue, to supersede the circulation of private notes, which were previously given for all sums from sixpence upwards. The seat of government, about the ultimate position whereof doubts were entertained, was finally decreed to be at Hobart Town, great improvement in the style of whose buildings was soon perceptible; handsome stone and brick edifices rose one after another in rapid succession, and in all directions; large well-finished shops took the place of the cottages which had from time to time been run up without form or order; and wharfs, quays, and macadamized streets attested the public confidence and the energy of the people. With respect to the interior, great progress was made in fencing, clearing, and tillage; improved breeds of stock were introduced by some intelligent farmers from the south of England; good roads and bridges were made throughout the colony; markets and fairs were established; joint-stock companies were formed at Hobart Town and at Launceston; whale-fishing was carried on with activity; the exports were increased; the public revenue augmented, and exceeded the expenditure by £20,000 a-year; the activity of the governor encouraged the erection of churches and chapels in various parts; the clerical establishment of the colony was enlarged; lay lecturers, or catechists, were appointed; education promoted; and male and female orphan schools founded.

As might be expected, the colonists, in 1830, then numbering 13,000 free persons, and increasing annually in a rapid ratio, earnestly desired a legislature, composed of representatives elected by themselves. An address was therefore voted to the crown, on this and on other points, for which redress was sought. The following paragraph, conveying the opinion of Governor Arthur to his Majesty's Secretary of State for the Colonies on the subject, deserves a record, for it speaks volumes in favour of both the governor and the governed, and proves how little, even at that time, Van Diemen's Island deserved the indiscriminating abuse applied to it, as "a den of thieves":—

"Legislation by representation is a mode of government so interwoven with the habits of Eng-

lishmen, and so endeared to them by a thousand associations, that it is not at all surprising the petition for an assembly should have received so many highly respectable signatures; nor am I prepared to say that I do not respect the *passion for British institutions which so remarkably distinguishes the inhabitants*—more especially when I reflect that it is proved by the liberal contributions for the building of churches, made in almost every district, that the attainment of the elective franchise is not the only national object which interests them.”

His majesty's government did not accede to the wishes of the colonists; a legislative council, composed of fifteen persons, nominated by the crown, had been granted by act of Parliament in 1829, and the laws of England were said to be in force so far as the circumstances of the colony would permit. Some useful enactments were however made; courts of Quarter Sessions and of Requests were established, and trial by jury in civil and criminal cases was granted in 1830. It is not within the scope of my plan to comment on the individual rule of representatives of the crown in the colonies, but in this case I may be excused for the exception. The administration of Lieutenant-governor Arthur closed on 30th October, 1836, having lasted upwards of twelve years; and speaking from personal knowledge of him as governor of Van Diemen's Island, and subsequently as governor of Bombay, I have no hesitation in saying that a more efficient, conscientious, and Christian ruler never presided over a British dependency. On his departure he received several valedictory addresses, and £1,500 was raised to present him with a piece of plate as a tribute indicative of the esteem of the colonists; moreover during a long career of public service as chief of the government at Honduras, Van Diemen's Island, Upper or Western Canada, and Bombay, Sir George Arthur never received a rebuke from his superiors in England; the Horse Guards, the Colonial Office, and the E. I. Directors having all paid him the gratifying tribute of commendation.

Sir John Franklin (whose return from the North Polar seas the nation has well nigh ceased to hope) was the next governor of Van Diemen's Island. During his administration the act of parliament enjoining the sale of the crown lands in the Australian colonies by auction at a high minimum price was brought into operation. The

effect of this measure has proved as injurious to Van Diemen's Island as to New South Wales and the other colonies in Australia, by preventing the sale of the land, and consequently the immigration of the free yeoman class, so much needed for the welfare of this penal colony. Sir John Franklin, in reply to a despatch from Lord Stanley, in 1839, directing him to raise the minimum price from 5s. to 12s. per acre, clearly foretold the consequences, and stated, “there is every reason to believe that there does not remain any considerable portion of land in the territory of a higher value than 6s. or 7s. per acre. Your lordship will therefore perceive that this instruction is in effect an instruction virtually abolishing sales of land in Van Diemen's Island, and must accordingly put an end to the already declining land sales.” The opinion of the lieutenant-governor was disregarded, and not only has the sale of land ceased, but cultivation has been stationary, and the progress of the colony materially impeded by this ill-judged legislative enactment. Sir J. Franklin was succeeded by Sir J. E. E. Wilmot, in August, 1843, who was recalled in consequence of certain allegations impeaching his moral character, which however it is but just to state, that a large and respectable class of the colonists considered unfounded. He died in the colony in October, 1846, partly from disease, doubtless accelerated by distress of mind. The present lieutenant-governor is Sir William Denison, a captain in the Royal Engineers, and under this officer, (the boon so long solicited by the colonists being at length granted,) the first representative Legislative Assembly will be elected in conformity to the act passed by Imperial Parliament in 1850, “for the better government of her Majesty's Australian colonies,” in which Van Diemen's Island has been included. The provisions of this act have been detailed in the previous volume, pp. 561—563. It is due to the colonists to state that they have long sought this boon from the Imperial Legislature, and for several years very many of them have earnestly protested against the continuation of transportation to Van Diemen's Island, more especially since its abolition in New South Wales in 1840,* when this fine island became

* By an order of her Majesty in council, dated 2nd June, 1840, it was declared that, on and after the 1st August, 1840, “Van Diemen's Land, Norfolk Island, and the islands adjacent to, and comprised within the government of Van Diemen's Land, shall

be the places to which felons and other offenders in the United Kingdom then being, or thereafter to be, under sentence or order of transportation, shall be conveyed, under the provisions of the act, 5th of George the Fourth.

almost the sole receptacle for the criminals banished from the United Kingdom. Petitions have been sent to the Imperial Parliament in 1845, 1848, and 1849, praying for the cessation of convict transportation to Van Diemen's Island. That of 1845 comprised among its signatures that of Dr. Nixon, the bishop of Tasmania, those of six out of eight unofficial members of the Legislative Council, of thirty justices of the peace, a large number of landed proprietors, clergymen of different persuasions, professional men, tradesmen, and mechanics. I give the petition verbatim, because it deserves respect, conveys the feelings and opinions of a large and respectable class, and contains a brief enumeration of many facts highly creditable to the Tasmanian colonists; moreover it breathes throughout a loyal spirit—even the grievances, real or supposed, therein complained of, being put forth in mild and temperate language. The arguments on this subject have been since ably and temperately urged on the consideration of her Majesty's Secretary of State by Mr. J. A. Jackson, the London agent of the colonists who hold these opinions:—

"The humble Petition of the undersigned Free Colonists of Van Diemen's Land.

"**SHEWETH**,—That in approaching your Majesty to pray your gracious protection, we desire to express our sincere loyalty to your Majesty, and our firm attachment to the constitution of the British empire.

"That in making our present application, we treat your Majesty to believe that we are actuated by no factious feeling, by no unreasonable discontent, nor by any motive but such as ought to influence us as men and as Christians.

"That we appeal to Sir Eardley Wilmot, our lieutenant-governor, to testify that what we state as matter of fact in this petition is in no degree erroneous or exaggerated; and, as a considerable number of your petitioners are personally known to his excellency, and also to our late lieutenant-governor, Sir John Franklin (who is now in England), we further appeal to them both for their testimony as to the general position and character as colonists of many of those who now address your Majesty.

"That we remind your Majesty that from the year 1824, the British government promoted and encouraged the emigration of free settlers to Van Diemen's Land, by public notices issued, from the colonial office, the horse-guards, and the admiralty, and offered as inducements to such emigration, at first free grants of land, and latterly allowances to naval and military officers in the purchase of crown lands.

"That the obtaining of free grants of land was conditional upon the settlers investing a considerable capital in the colony, and being persons of character and respectability; and that all those who obtained such grants, and all military and naval officers obtaining the allowance in purchasing land, were required to become permanent residents in the colony.

"That under these inducements, and under these

conditions, a large body of your Majesty's free subjects became settlers in Van Diemen's Land as farmers and merchants.

"That up to the year 1831, a considerable number of your Majesty's free subjects had also emigrated to Van Diemen's Land as mechanics and farming men; and after that year, the number of these emigrants was increased under the system of bounties sanctioned both by the British and colonial governments.

"That by the industry and capital of these various colonists, an extensive commerce has been created, two considerable sea-port towns, besides several inland townships (or villages) and numerous houses and farm buildings have been erected, and a vast quantity of the waste land in the colony has been cleared from the forest and brought into cultivation.

"That from the year 1824, to the year 1840, the population of the colony increased from 12,700 to upwards of 40,000—the number of acres in cultivation from 25,000 to 124,000—the colonial shipping from one vessel of 42 tons to 141 vessels, comprising 12,491 tons—the imports (chiefly of English goods carried in English ships) from £62,000 to £988,356—the exports from £14,500 to £867,007 in which the wool alone amounted to £223,000—the colonial fixed revenue from £16,863 to £118,541—and that the sum of £218,790 was between the year 1828 and the year 1840 (inclusive) invested by the colonists in the purchase of crown lands.

"That during the same period, the number of places of worship increased from four to forty-four, and that there was a corresponding increase in the number of schools and other establishments for education.

"That from the year 1824 to 1840, the greater part of the convicts transported from England were sent to New South Wales, and only a small proportion to this island, who immediately upon their landing were dispersed over the colony as labourers and servants.

"That from the rapid increase of the free colonists, and the limited number of convicts sent to Van Diemen's Land, those among the latter who became free, or who by their good conduct were allowed to work on their own account, obtained full employment at high wages, thus having the strongest stimulus to good behaviour; and from this circumstance, but especially from each convict being at once separated from his associates, and accustomed to regular labour, and from the facility with which a moderate number could be kept in order, the majority of convicts in Van Diemen's Land were industrious and useful members of society, and the security of life and property was as complete in this island as in any county in England.

"That from 1824 Van Diemen's Land was, therefore, no longer merely a penal settlement, as in 1804 when it was first occupied, but a colony established under the sanction and encouragement of the English government, and supplied with a certain amount of convict labour which the settlers could readily employ, and for which they paid by defraying the whole expense of the convicts after their arrival.

"That during the sixteen years in which the prosperity of the colony was so remarkable, the proportion of convicts to that of free inhabitants constantly and regularly decreased, so that in 1840 the number of convicts as compared to the number of free inhabitants was little more than one-half the number in 1824.

"That in the year 1840 the home government dis-

continued sending convicts to New South Wales, and this small island was converted into the sole penal settlement of the British empire, the sole receptacle for all criminals transported from every part of your Majesty's vast dominions—from England, Ireland, and Scotland—from Canada, India, and Africa—and latterly also for all criminals transported from your Majesty's recent possessions in China.

"That in thus converting a flourishing British colony into an immense gaol, the free inhabitants had no voice—that their consent to an alteration so fatal to their interests was never obtained nor ever asked, and that they had not even the option given them, of selling their property to the government and leaving the island—a measure which your petitioners do not deny the British government had a right to subject us to, if the change had been for the general benefit of the empire.

"That in none of the notices issued by the government, either to free settlers or to free mechanics and labourers, is there a single intimation given that at any time, or under any circumstances, this colony would be placed under the present system; that we believe it was never thought of until 1840—that not a single colonist ever anticipated it—that, on the contrary, the increase of the population and the whole system of our government led us to look forward to the time when transportation to this colony would altogether cease—that many circumstances induced us to entertain this view, and we especially refer to the petition from this colony for a free representative assembly in the year 1838, to which your Majesty was pleased to return a very favourable answer, it being obvious that to a merely penal colony a free assembly could not be granted, or, if granted, that it would be useless.

"That your petitioners were in total ignorance of the details of the new transportation system until within the last few months, when part of the instructions sent by the right honourable the secretary of state for the colonies to the lieutenant-governor was published in the colonial newspapers.

"That from these instructions we learn that all male convicts sentenced to transportation for life, and a portion of those transported for fifteen years, are first to be sent to Norfolk Island, where they are to be kept not less than two years, and to be then transferred to Van Diemen's Land, that the number of criminals to be thus disposed of is estimated at 1,000 a year—that these convicts, and also all those transported in the first instance to Van Diemen's Land, are to be kept in probation gangs, each consisting of from 250 to 300 men, in which each convict was to remain not less than one year, or more than two years, (except in case of misconduct, when he may be detained several years)—that he is then to receive a pass which enables him to engage in private service for wages, and if he cannot obtain employment; he is to remain in the service of government, receiving merely food and clothing.

"That under the new system 13,764 male convicts and 2,492 females have been landed in this island between 1st January, 1841, and 31st October, 1844.

"That our only means of keeping these men under any kind of control are the few soldiers that are detached from head-quarters and the police of the colony.

"That the expense of this police, which is chiefly occupied in protecting us against criminals forced upon the colony against our strongest wishes, is borne by our colonial revenue,—that a further large

part of that revenue is sunk in various expenses connected with the new convict system; as one instance of which, we state that, from January, 1843, to June, 1844, the expense of witnesses at the supreme court (exclusive of the quarter sessions) was £2,447 10s. 6d., of which £2,208 was for witnesses on trials of convicts,—that the large sums which the local government cannot avoid thus applying without leaving us altogether unprotected, have already created considerable colonial debt, the whole of which has been incurred on account of the new convict system, and which, as far as we can see, must increase: thus, not only anticipating our revenues, but embarrassing the colonial government, and depriving it of the means of undertaking any works of public utility.

"That before the meeting of the legislative council in February last, the lieutenant-governor appointed a committee to report upon the colonial finance, that this committee appointed a stamp tax, further taxes on tea, and other imported commodities, a tax upon dogs, and taxes (in the form of licences) for carrying on various branches of trade; that an act for taxing tea and other imports was thereupon laid before the council, the members of which are all nominated by the crown, that petitions against this act, numerous signed by the colonists, and pointing out the injustice of taxing them for the coercion of British criminals, were presented to the lieutenant-governor in council,—that the act was notwithstanding passed, and is now law,—and that in addition to the previous colonial debt, arrangements were made during the same sitting of council for a loan of £25,000 from one of the colonial banks.

"That your petitioners have thus to pay taxes imposed by a council in which they have no representative, and levied, not for any colonial purpose, but to support the new convict system which is fast destroying the colony.

"That we are aware that the funds derived from the sale of crown lands were given up to the colonial revenue in Van Diemen's Land and also in New South Wales, in consideration of each colony paying its police; but we remind your Majesty that that arrangement was made in 1836, when the greater part of the convicts were sent to New South Wales, and when the crown lands were sold at five shillings an acre; whereas, since the transfer of the land fund the home government has raised the minimum price to twenty shillings an acre, at which (even if the colony were not in its present circumstances) these lands are almost quite unsaleable; and that, in fact, the land fund has fallen from £52,905 in 1840, to £8,913 for the first three quarters of the year 1844, and is estimated by his excellency to produce no more than £2,000 for the present year.

"That the police thus paid by the colony, although enormous in proportion to the population, is far too limited to give efficient protection to the colonists, the convicts being spread over the island in gangs of from 200 to 300 each.

"That already under the new system crime has increased to an alarming extent:—that in 1840 there were 507 prosecutions for crime in the supreme court and quarter sessions, of which 407 were against convicts; while in the first eleven months of the year 1844, there were (besides numberless offences tried before the magistrates) no less than 812 prosecutions in those courts, of which 713 were against convicts or those who had been convicts.

"That by keeping criminals in large gangs, as at

present, they cannot be benefited or improved, but on the contrary become deteriorated; that from the numbers already sent, their strongest stimulus to good conduct has been withdrawn, for the free settlers cannot employ them; that of those who have earned permission to work for themselves there are already 2,000 unemployed, and without the chance of employment: and that it is impossible that the good conduct of any man, whether a convict or not, can continue, who is compelled to associate exclusively with criminals, and who is without any prospect of bettering his condition.

"That this unbounded supply of convict labour, has of necessity thrown out of employment many of the free labourers who were induced by the government to emigrate hither, and must soon drive them out of Van Diemen's Land, thus further lessening the proportion of free inhabitants in the colony.

"That we are in a state of continual dread and anxiety for ourselves and our families owing to the number of convicts by whom we are surrounded; that we feel we have no security for life or property; that the moral condition of the colony is daily becoming worse and worse; that no regulations, however well intended, no government, however able, no improvement in detail, can counteract the evils of the enormous mass of criminals that are poured upon our shores; and that if the present system of transportation continues, we must, at whatever sacrifice, abandon a colony which will become unfit for any man to inhabit who regards the highest interests of himself or of his children.

"That in the violent commercial convulsions which have been felt during the last two years in all the Australian colonies, our colonial property has fallen more than one-half in value, and that much distress has been thus occasioned; but this distress is aggravated ten-fold by the state to which the transportation system has reduced us, and by the gloomy prospect of the future.

"That the large government expenditure under the present system is of some pecuniary benefit to us in the depressed condition of our affairs, but we cannot put it in competition with interests of a higher nature, or allow it for a moment to weigh against the moral evils which that system produces.

"That under the circumstances which we have thus detailed to your Majesty, the prosperity of this colony is at an end; that its commerce must decay, and its lands become almost valueless; that no new capital is now invested in it, and no new emigrants now come to it, and that we look for none, for we ourselves would never have emigrated to Van Diemen's Land had we foreseen its present state.

"That there is yet a more fearful evil produced by the present system of transportation; that it is reported and believed that the unhappy men sent to Norfolk Island have sunk into deeper pollution and depravity, and that if such men are added to the unbounded number of criminals already in Van Diemen's Land, this island and the neighbouring colonies, among which they must ultimately be diffused, will exhibit a spectacle of vice and infamy such as the history of the world cannot parallel.

"That the removal of the various evils which the transportation system causes to the free colonists, is within the scope of that power which the Almighty has placed in your hands; that we cannot doubt your Majesty's willingness to remedy them; and that, even in our present depressed situation, we shall

await your Majesty's decision with the confident hope that they will be removed.

"Your petitioners humbly pray your Majesty that the number of convicts in this island may as speedily as possible be reduced to that which existed in 1840; that transportation to the colony may cease until this object is effected; that meanwhile adequate protection may be afforded to the colonists, and better means adopted for the moral and social improvement of the convicts; that the colony may be relieved from every expense occasioned by convicts not in the employment of settlers, and that arrangements may be made for the gradual and total abolition of transportation to Van Diemen's Land.

"And your petitioners will ever pray."

On the 24th of December, 1849, a great public meeting was held at Launceston, in order to promote free institutions, and to urge the discontinuance of transportation. The requisition convening the meeting was signed by twenty-three of the oldest and most respected magistrates of the northern division of the island, and after several eloquent speeches, petitions to the Queen, and to both houses of parliament, were unanimously adopted.

The petitioners state that within a recent period of four years, upwards of 16,000 convicts have been introduced into Van Diemen's Island, and allege that this had been the reason why so many free persons have left the island; the number who have done so since 1841, being "estimated at not less than 12,000;" this emigration having been necessitated by the "overflowing supply of the labour of convicts not permitted to quit the colony, but allowed to work for themselves, and to compete with the free colonists, while they are able and willing to do so, but who are supported by the government in idleness when they are out of work, or not disposed to work."* The petitioners farther allege that there are now 26,268 male and 4,578 female convicts in the island, and that if this system be continued it must end in the moral degradation of the free population of the colony.

The number of convicts sent to Van Diemen's Island since its formation as a penal settlement, in 1803, would equal above two-thirds of the total population, free and bond, now in the colony. According to returns before me, shewing the name and date of arrival of the different ships which reached the colony, and the number of convicts on board each vessel, between 1817 and 1848, a period of thirty-one years, it appears that the males were in number 47,814, and the females 9,045—total, 56,819 Of the males,

* Petition to the House of Lords.

28,258 belonged to what has been termed the "*old class*," which arrived between August, 1817, and March, 1840; 1815 belonged to the "*probation class*," and arrived between June, 1840, and March, 1847; and 901 to the "*ticket-of-leave class*," between September, 1847, and July, 1848. The number during each year is shewn as follows:—

Year.	Males.	Females.	Year.	Males.	Females.
1817	268	—	1833	2,563	241
1818	581	—	1834	1,380	151
1819	649	—	1835	1,944	301
1820	1,398	161	1836	2,022	310
1821	1,017	61	1837	1,183	113
1822	806	45	1838	2,186	284
1823	913	117	1839	1,376	302
1824	705	50	1840	1,281	184
1825	684	129	1841	2,682	626
1826	510	100	1842	4,699	681
1827	854	214	1843	3,048	684
1828	1,028	172	1844	3,979	649
1829	929	181	1845	2,243	607
1830	1,900	235	1846	866	340
1831	1,899	340	1847	645	624
1832	1,051	149	1848	661	1,000

By an official return, signed "James Thompson, registrar," the number, of late years, is greater than the above: for during the sixteen years ending with 1846, the convicts who arrived were—males, 36,382; females, 6,195 = 42,577.

According to statements laid before the colonial minister by Mr. Jackson, on 12th March, 1849, the social status of 38,133 adult inhabitants is thus classified:—

Male convicts, under sentence	22,678
Men whose sentences have expired	8,832
Females under sentence	3,936
Females whose sentences have expired	2,687

The colonial agent, however, while faithfully fulfilling his duty in laying these and other representations before his Majesty's ministers, frankly bears high personal testimony in favour of the proceedings of Earl Grey, and admits the difficulties with which the subject is surrounded. Mr. Jackson, in the above-quoted letter to Mr. B. Hawes, M.P., under-secretary of state for the colonies, says—

"Lord Grey's anxious desire to consult the welfare of the colony, is conspicuous both in his professions and his acts. The colony is indebted to his lordship for the surrender of the land fund, his constant endeavours to cause improvements in the discipline of the convicts, his measures adopted for sending out the wives and families of deserving convicts, and, at least, his *reduction* of the number and the improved character of the convicts to be sent there in future. I hope the colonists will not be slow to acknowledge these acts. I am, however, better able than those distant colonists to appreciate the various difficulties which his Lordship has to encounter."

It is understood that the chief obstacle which prevents a compliance with the wishes of the colonists, arises from the very large expenditure which has been incurred by the British treasury in Van Diemen's Island, in making it a fitting receptacle for convicts, and in the well-organized and efficient superintendency and police establishment which are maintained on the island, not merely for the guarding of the prisoners, but with a view to their continuous employment, instruction, and reformation, as will be shown in a subsequent chapter.

I have, in the previous volume, expressed my own opinion concerning the transportation of convicts (in limited numbers) to distant settlements, where, as in Western Australia for instance, labour on public works is urgently required, and can now be procured only at an enormous expense; nor do I see a better mode of employing those, who, having forfeited their liberty by the commission of crime, have rendered themselves a disgrace and a danger to the state, than by thus preventing their being also a useless burthen to it. This, I hold, cannot be better done than by employing them in preparing new settlements for the reception of free settlers; in the construction of forts and harbours, and roads; in hewing down forests, and in the numerous toilsome and laborious tasks necessary to convert the wilderness into a fitting abode for civilized man. But it is one thing to use convict labour as a means of assisting the exertions of the free citizens, and quite another to employ it to such an extent as to overwhelm their exertions by its undue preponderance. That this has unfortunately been the case in Van Diemen's Island, appears to be very generally believed.

Earl Grey himself frankly admitted, in his able speech in the House of Lords, 14th March, 1850, on moving the second reading of the "*convicts prisons bill*," that—

"The whole colony was thrown into confusion and disorder, owing to the large number of convicts who had no employment. This led to a state of things which was absolutely frightful: the demoralization which took place among the probation gangs was shocking to contemplate."

At the close of 1840, the number of convicts in the island was no more than 7,942; between 1840 and 1847, inclusive, the number of convicts who arrived was—males, 20,532; females, 3,940 = 24,474. Captain Stokes, R.N., who was employed for five years in surveying Australia and Van Diemen's Island, visited the various settlements, and judged for himself of their actual state.

After speaking in high terms of the "full tide of prosperity that covered the island in 1840," he proceeds to observe—

"Everything wore a smiling prospect: the fields were heavy with harvests; the roads crowded with traffic; gay equipages filled the streets; the settler's cottage or villa was well supplied with comforts, and even with luxuries; crime, in a population of which the majority were convicts, or their descendants, was less in proportion than in England; the exports, for the first time, exceeded the imports; trade was brisk; agriculture increasing; new settlers were arriving; everything betokened progress; no one dreamed of retrogression or decay."

To this picture the observant officer adds—

"In four years all this was reversed; and though many other causes may have co-operated in producing this change, it seems acknowledged by most persons, that the result is chiefly traceable to the disproportionate increase in the amount of population, which first checked free immigration; and secondly, by glutting the labour market, the free population was necessarily displaced, and those who had actually established themselves on the island as their second home, were driven away from it."

The most recent measure adopted by her Majesty's government for the purpose of mitigating the evils arising from too rapid an influx of convicts, was the introduction of military pensioners. In December, 1849, Earl Grey announced to Sir William Denison, the governor of Van Diemen's Island, that parliament having granted £30,000 for promoting emigration to those colonies to which convicts are sent, her Majesty's government, with a view of introducing a body of loyal settlers, and also of adding to the internal security of the colony, and increasing its means of military defence, had resolved on gradually introducing military pensioners as guards in convict ships, such pensioners to be accompanied by their wives and children, and commanded by a commissioned officer. The local government was directed to make arrangements, and keep some accommodation vacant in Hobart Town, or its vicinity, for the reception of these men and their families on their first arrival. The act 6 and 7 Vict., c. 95, provides for the enrolment of pensioners for occasional duty in the United Kingdom; and 10 and 11 Vict., c. 54, extend the provisions of the previous act to the colonies. Under the royal sign manual, this description of force in Van Diemen's Island is fixed at 500 men. Earl Grey directed, on 13th December, 1849, that the pensioners should have some vacant accommodation provided for their lodging on their first arrival, and as soon as practicable, be placed on certain small plots, of two to five acres,

of land, which should become their own after seven years' service as enrolled pensioners in the colony, provided they should have fulfilled the conditions of their agreement. The governor was also authorized to employ the labour of convicts in preparing their allotments, and helping them to erect dwellings; the entire cost to be incurred for their houses not to exceed the rate of fifteen pounds a head on the whole number of pensioners. An *esprit de corps* was to be fostered by these retired soldiers being, as far as possible, settled in one neighbourhood, within reach of schools for their children, and of the means of receiving religious instruction, and of attending divine worship. With the exception of twelve days in the year, appointed for military exercise, and of the liability to be called out in support of the civil authority, or for the defence of the colony, the pensioners are to merge in the general working population, and live by their own industry. The bedding supplied by government during the voyage is given to the emigrant soldiers and their families; and the secretary of state directs, that if the pensioners be unable, immediately on landing, to obtain a good livelihood by private engagements, that employment be offered them on public works as labourers, such employment not to extend beyond the first six months after their arrival in the colony. Great credit is due to Earl Grey for this statesman-like and generous policy.

The statistics given in a subsequent chapter preclude the necessity of dwelling, in this place, on the existing social position of the colony, which, under all circumstances, is singularly creditable to the free settlers.

The following is a list of the lieutenant-governors of Van Diemen's Island, and of the officers temporarily administering the government since the formation of the colony:—

Lieutenant-governors.	From	To
Lieut.-col. D. Collins, R. Marines	Feb. 16, 1804	Mar. 24, 1810
Lieut. Edward Lord	May 24, 1810	Feb. 1812
Capt. Murray, H.M. 73rd Reg.		
Lieut.-col. Gills	Feb. 1812	Feb. 4, 1813
Lieut.-col. T. Davey, R. Marines	Feb. 4, 1813	April 9, 1817
Lieut.-col. W. Sorell	April 9, 1817	May 14, 1824
Lieut.-col. George Arthur	May 14, 1824	Oct. 30, 1836
Lieut.-col. K. Snodgrass (acting)	Oct. 31, 1836	Jan. 5, 1837
Captain Sir J. Franklin, R.N.	Jan. 6, 1837	Aug. 21, 1843
Sir J. E. E. Wilmot, Bart.	Aug. 22, 1843	Oct. 13, 1846
Charles Jos. Latrobe (acting)	Oct. 13, 1846	Jan. 26, 1847
Sir W. T. Denison, B.E.	Jan. 26, 1847	—

Note.—Lieutenant-colonel D. Collins died on the 24th March, 1810; Lieutenant-colonel T. Davey, on the 2nd May, 1823; and Sir J. E. E. Wilmot, Bart., on the 3rd February, 1847.

CHAPTER II.

PHYSICAL FEATURES—COAST LINE, AND ADJACENT ISLANDS, BAYS, AND HARBOURS—MOUNTAINS, RIVERS, AND LAKES—DIVISIONS—CHIEF TOWNS—AND GENERAL TOPOGRAPHY.

PHYSICAL FEATURES.—Van Diemen's Island is literally a land of hill and valley, mountain and stream, and it may be added, of forest, flood, and fell. It is true indeed that its loftiest ranges, when compared with the mighty Himalaya, the Andes, or the Alps, appear as insignificant as do its streams (including even the beautiful Derwent) to the traveller who has been borne on the broad bosom of the Ganges, Amazon, or Danube; but its immense forests of unfading, though somewhat sombre green, impart to its aspect a peculiar stamp of massive grandeur. Its general character is moreover decidedly mountainous, the whole surface having been apparently heaved up by some mighty convulsion, or series of convulsions, in masses of all shapes and sizes—sometimes of barren rock, though more frequently densely wooded; but in either case too often rugged and impracticable, abounding in abrupt acclivities and almost inaccessible gullies; in other places forming grassy and lightly timbered slopes, whose verdure, though of a browner hue than that of our English meadows, is yet enlivened by the yellow buttercup, that homely flower so dear to the immigrant; elsewhere it forms luxuriant flats, generally of eight to ten thousand acres, surrounded in irregular circles by densely-wooded hills, whose loftiest summits are from April to October capped with snow. This latter description of country is frequent in the interior, on which several extensive lakes are situated in a kind of elevated table-land. The northern portion of the island also possesses fertile and extensive plains; the southern is extremely hilly; but in the west and south-west a very unexpected proportion of available land has been recently discovered. On the banks of the numerous streams a line of rich soil is almost invariably found, subject however to occasional floods; for this serious inconvenience, the extremely undulating nature of the country, though to a great extent the cause, offers a remedy by presenting facilities for a sound system of drainage, which if carried out would likewise render the marshes and swamps, now both unprofitable

and unsightly, not merely available for cultivation, but extraordinarily productive.

The proportion of land adapted either for the plough or for pasture has been differently estimated, and the calculation at the best can be but imperfect and unsatisfactory, since the difficulty of forming a just opinion of the quality of land without practical experience of its capabilities, has been repeatedly proved by the opposite opinions expressed by explorers of the same tract. The general opinion is, I believe, that including the whole extent with which we are now acquainted, about two-fifths is the very utmost that can be considered available, and of this three-fourths is pasture-ground. The island is by all accounts so densely wooded that it would appear strange that there should be so much pasturage, but it must be remembered that the Tasmanian trees are chiefly eucalyptæ, and whether boldly erect and widely ramified, or stunted in their growth, they very rarely yield so dense a shade as to materially impede the vegetation of the grasses, which Strzelecki declares to be in many localities untrodden by flocks and herds, luxuriant beyond description, "and extending from the level of the sea to (almost) the highest altitudes of the colony." He instances the lower parts of Ben Lomond, Ben Nevis, Dry's Bluff, and Lake St. Clair, between an altitude of 3,000 and 4,200 feet.

Having thus stated the peculiarly rugged and unpromising nature of some parts of the island, it is only right to mention on the other hand, the testimony of Lieutenant Jeffreys, who quite in the early days of its settlement "crossed from Hobart Town to Port Dalrymple, a distance of 125 miles, in a barouche, with three and sometimes four horses in hand, and yet had not more than twenty miles of what could possibly be called a road, the whole being a beautiful level pasture, with but few trees to obstruct the view or the passage." The country, indeed, could sustain at least three million people.

COAST LINE AND ADJACENT ISLANDS.—The shores of Van Diemen's Island are in

general high and rocky, except on the north, where they form the southern limits of Bass Strait, and are chiefly characterized by low sandy beaches; to the south-east they are deeply indented and bordered by islands; to the south-west they are abrupt, and present the barren, rugged aspect which might be expected from their exposure to the storms and chilling winds that blow direct from the polar regions; but on all sides they form capes, headlands, and points, and afford safe anchorages.

In tracing the varied features which distinguish the Tasmanian coasts, the magnificent estuary of the chief river claims the first notice. The mouth of the *Derwent*, on whose western bank Hobart Town is built, has two entrances, the one named *Storm Bay* by Tasman, from the tempestuous weather he there encountered (see page 1); the other, *D'Entrecasteaux Channel*, in honour of Bruni D'Entrecasteaux, the celebrated French admiral, by whom it was discovered in 1792, while commanding an expedition in search of the unfortunate La Perouse.

Storm Bay (in a north-east by east direction from *Tasman's Head* to *Cape Pillar*) is about thirty-five miles wide, and completely open to winds from the south and south-east; the depth at half-a-mile from *Cape Raoul* is fifty fathoms; in the middle of the bay it is thirty-five fathoms, gradually decreasing towards *Bruni Island*, and in a direct line from thence about north by west to *Betsy's Island*, shoals to twenty-five, sixteen, and twelve fathoms. It opens into *North or Frederick Henry Bay*, which is sixteen miles long, and in some places six and-a-half miles broad, the greater part perfectly land-locked, and affording good anchorage in two to fifteen fathoms water. North bay to the southward opens into *Norfolk Bay*, which is nine miles long, by three miles broad, completely sheltered, and having in no part less than four fathoms. This fine haven is bounded to the eastward by *Forestier's Peninsula*, which is connected with the main land at its northern and southern extremity, by very narrow isthmuses, which at some future day may probably be cut through so as to afford more ready inlet or exit for vessels on the east coast.

Adventure Bay, on the south-west shore of Storm bay, has good shelter from west and south-west gales, but a heavy surf generally breaks on the beach. *Fluted Cape*, which forms its south-east extremity, is high, steep, and projecting, composed of

circular basaltic columns standing close together, in the form of the barrel of an organ, and covered with trees. *Penguin Island*, adjacent, is small, of moderate height, and also clothed with timber.

Bad Bay, at the southern extremity of Bruni island, deserves its name, being exposed to all the fury of the south-west winds. *Cape Bruni* and *Tasman's Head*, on either side of this bay, bear S. 79°, cast eight miles.

D'Entrecasteaux Channel, the south-west entrance to the Derwent, is a continuous line of land-locked harbours, being in length about thirty miles, and varying in breadth from two to eight miles, with a depth of from six to thirty fathoms, on a black muddy bottom. Throughout its whole extent, it offers a magnificent series of panoramic views. The ship in which I sailed entered the channel at midnight, leaving behind (at Bruni Head) a severe tempest. When the morning dawned, she lay at anchor with her bowsprit almost among the trees of Bruni island, amid scenery which, as a whole, is of surpassing beauty. I have visited the far-famed lakes of Killarney, Lomond, and Geneva, but to me D'Entrecasteaux channel excels them both in grandeur and beauty; the shore on either side is characterized by deep sinuosities and bold projecting headlands; here, a romantic-looking bay, with grassy knolls; there, a wooded eminence, down which a silvery cataract leaps noisily from rock to rock; occasionally a verdant isle breaks the path of the waters, and ever and anon a rustic cottage, thriving farm, or comfortable homestead, with its numerous adjuncts, animate and inanimate, breaks in upon the wild grace of nature, and attest the presence of civilized man. A much-needed lighthouse was erected by Sir John Franklin, when lieutenant-governor, in a favourable position on the south-western extremity of Bruni island, which a wide gap cut in the woodland behind renders easily perceptible from seaward; it serves both by day and by night to warn vessels entering the channel, of the shoals at the mouth, which had, previous to its erection, proved fatal to several vessels. Among these was the *Actæon*, on the reef which has since borne its name. Another very distressing instance was the wreck of the convict ship *George the Third*, in which 134 persons perished, of whom the majority, being convicts, had been kept below, to prevent a general rush to the

boats. The remainder (174 persons) were providentially saved by a small schooner then engaged in cruising in that vicinity. In July, 1835, the *Enchantress*, a merchant ship, beating up the channel, struck, as it was said, on a *weather shore*, and went down in deep water in fifteen minutes. Soon after the *Wallace*, barque, from Leith, shared the fate of the others. By the aid of the above-mentioned beacon, and of the efficient pilots now stationed on the look-out for vessels, the entrance to D'Entrecasteaux channel is easy at all hours; and once beyond *Partridge Island*, the navigation is, with the most ordinary precautions, safe throughout. There are several excellent havens on both sides; on the eastern or Bruni island shore, are *Taylor Bay* or *Great Cove*, *Little Cove*, *Isthmus Bay*, *Great Bay*, and *Barnes Bay*, capable of receiving the largest vessels. *Great Cove* is spacious, and ill sheltered from the north-west winds, but when these are violent, shelter may be readily obtained in the havens on the opposite coast, of which the first met with (from the southward) is, *Recherche Bay*, so called by the French admiral, after his ship. It is about three miles wide and two miles deep, with anchorage in six to twelve fathoms. Two arms extend, the one to the southward, termed *South Port*, the other to the northward, into which the D'Entrecasteaux and Catamaran rivers flow. *South Port* has a land-locked anchorage, three to five fathoms soundings of fine sand. The shores around are densely wooded, and rise to a considerable height. Fresh water is obtainable from several streamlets, and a projected township called *Ramsgate*, is marked at the bottom of this snug harbour. *North Port* is about a third of a mile wide, at the entrance, but increases to two-thirds immediately within, and extends in a northerly direction nearly two miles, with a depth of five, four, and three fathoms, in black mud, to three-quarters of a mile above the entrance, at a moderate distance from the shores, which are sloping, and covered with thick wood. The waters of this haven are unruffled, even during the violent winds.

Muscle Bay, about six miles north-east of Recherche bay, is some two and-a-quarter miles deep to the westward, with fourteen fathoms in the middle, and six fathoms near the shore. A lagoon runs some distance further west, into which a streamlet flows.

Esperance Bay, six miles and-a-half north-north-east from the preceding, is about one mile and-a-quarter wide, and five miles deep, in a north-west and south-west direction; there are seven fathoms and-a-half in the entrance, and secure anchorage in three to five fathoms. Like the other havens, a small stream disembogues at its head.

The next inlet in the coast is that formed by the really considerable

Huon River, so called from the companion of D'Entrecasteaux, Captain Huon Kermandee, of the *Esperance*. Its estuary extends seven miles north-west by west, and then takes a north by east direction to nearly the same distance. A beautiful islet (comprising about 300 acres), divides its entrance, there about three miles wide, and forms two passages, of which the western is the broadest, but has, in the centre, a small dangerous rock, conspicuous only at low water. Five miles up the Huon is a beautiful bay, named *Swan Port*, agreeably diversified with projecting points of land, clothed with fine timber. Captain Freycinet thus describes it:—

"Its extent in a north and south direction is upwards of four miles, upon a width considerably less: many deep bays present themselves on both sides, with all the necessary accommodation for the safety of vessels. Its coasts, although a little elevated, are, in general, steep: their declivity is gentle, and the remarkable fertility of the soil offers everywhere the most enchanting and varied appearance. In several places *natural quays are formed, easy of access for the largest vessels, or even for the purpose of careening*. The middle of the harbour has from three and-a-half to seven fathoms water, upon a mud and sandy bottom; and with the exception of the interior of some of the bays, a depth of less than three to four fathoms is seldom found at a musket shot's distance."

North-West Bay, or *Port*, opposite the northern extremity of Bruni island, is of an irregular quadrilateral form, two miles in width, and five miles deep, in a northerly direction. The two points at the entrance are high and rocky; but the other parts of its shores are much less elevated, and everywhere easy of access. Several small streamlets fall into it from the south.

Bruni Island, which separates Storm bay from D'Entrecasteaux channel, is of very irregular form and unequal elevation. In length, it extends north and south about twenty-five miles; its breadth varying from one to seven miles. At the centre, the island is nearly divided into two parts, being connected only by a very narrow isthmus, five miles long. The deeply-indented shores

of Bruni island, attest the power of the great Southern ocean in its unbroken roll, while the basaltic character of its contorted surface, evidences the mighty subterranean power by which it would appear to have been raised above the crust of the globe.

Fluted Cape, on the east coast, presents to the eye an abrupt cut; its immense basaltic columns have been before mentioned.

Tasman's Head, and the other promontories on the southern shore, are high and bold; the northern half of the island is less elevated; vegetation is vigorous; and cultivation is carried on to a limited extent.

The entrance of the *Derwent River*, (properly so called), after passing out of D'Entrecasteaux's channel, round the north point of Bruni island, is marked by *Mount Direction*, and lies between a narrow tongue of land on the east, termed *South Arm*, and a small peninsula, called *Mount Lewis*, which approaches to within three-quarters-of-a-mile of *Kelly's Point*, on Bruni island. A light-house on *Iron Pot Island*, off Cape Direction, guides the navigator. On passing this entrance, the noble river expands into a capacious basin, in whose calm, deep, cerulean waters, many a fine fleet might ride at anchor. The evidences of cultivation are perceptible on either shore, and increase as the voyager proceeds to the anchorage at *Sullivan's Cove*, Hobart Town. There is no danger all the way up; the breadth is from two to four miles: ships may "stand on" within half a cable's length on either side; the holding ground is good in every part—the depth of water nowhere exceeds eighteen fathoms.

Sullivan's Cove is formed by a bend of the land; a low, sloping point shelters the shipping from seaward. The anchorage is good anywhere off the town, in nine to twelve fathoms, on soft mud. Four miles higher up the Derwent is *Risdon, or Rest-down Cove*, where the first settlement was commenced in 1803 (see *history*, p. 4.) The river here contracts to a breadth of less than half-a-mile.

Ralph, or Double Bay, a singularly-formed and secure haven, lies off the eastern shore of the Derwent, and stretches so deeply into the land, as in two places nearly to isolate the tongue of land which separates the Derwent estuary from North bay. It extends six miles, north and south; has a breadth of two miles and-a-half; an entrance a mile and-a-half wide; and soundings from two to seven fathoms.

The smaller islands situated in *Storm* and the contiguous bays, are named *Iron Pot*, *Betsey*, *Sloping*, *Spectacle*, *Garden*, *Quoin*, &c. The first of these lies immediately off Cape Direction (the southern point of Ralph Bay peninsula), leaving only a boat passage between. *Betsey Island*, about two miles and-a-half to the eastward, is high, and only accessible towards its north end. It is about a mile in length, by half a mile in breadth, and was converted, some years ago, into a rabbit warren by the proprietor to whom it was granted: the speculation has proved successful; and the skins bring a good price in the Chinese markets. *Sloping Island* is situated in the channel between Storm and North bays.

It is here necessary to note, that the sand-banks near the entrance of the Derwent river are shifting in some places; and in others gradually accumulating. This is most manifest between the north end of Bruni island and the Iron Pot lighthouse. It should also be remarked, that the presence of sea-weed on these shores, does not always denote shoal water, but merely foul ground: in some places it is found 90 to 120 feet long, growing up to the surface. This is the case off Betsey island, between which, and two flat rocks on the main land, there are five to nine fathoms water, although the water is covered with this gigantic weed.

The tides in the Derwent and in D'Entrecasteaux channel are stated to be very irregular; according to the editor of the *Australian Directory*, or *Sailing Instructions*, published by the Admiralty, in 1833, they rise sometimes eight or ten feet, at others four or five, and occasionally there is no fall of tide for two or three days together. Towards the entrance of the Derwent the water at the surface sometimes runs upwards or downwards for twelve hours at a time, whilst the rise and fall near the shore are at the usual periods. These and other anomalies are probably occasioned by the winds and peculiar curvatures of the land; they do not appear to extend far below the surface, as a counter-current has been found at the bottom. At Macquarie harbour Captain King, during his stay of a fortnight, found the tides very irregular, high water occurring sometimes once, sometimes twice in the twenty-four hours, and in both cases the ebb running twice as long as the flood. Captain Kelly found a strong ebb or flood for nine days together without the water

rising or falling a foot; but during north-west gales the rise was found to be great, subjecting the adjoining low lands to repeated inundations. Quitting this extensive estuary I proceed to trace the coast in a north-easterly direction, commencing with the strange-shaped Dutch-named peninsula, whose south-western and south-eastern extremities are formed by two high column-like points, termed Cape Raoul and Cape Pillar. These capes are distant about nine miles; the intermediate coast falls back in a deep irregular curve, the lower part of which obtained from the French the name of *Mainjon Baie*; to the northward of this is *Port Arthur*, which runs inland for nearly five miles, having an entrance two-thirds of a mile in width, marked on either side by bold and bluff headlands. Its eastern shores are formed by a perpendicular wall of basaltic columns, and iron-stone rock, with a long line of lightly-timbered hills overtopping them and sloping backwards like an immense battery or embankment. Fresh-water streams flow through several rocky gullies, where a landing may be effected during an easterly wind. The western shore has for its seaward extremity a hill nearly 500 feet in height, with a clear round summit and perpendicular sides towards the ocean. Inwards the shore is broken by bays and sandy beaches, behind which extends an undulating tract covered with heath and small shrubs. Its chief havens are *Safety Cove* and *Opossum Bay*, which afford good anchorages for large vessels, the former being backed by an amphitheatre of lofty mountains which, commencing at Cape Raoul, extend to Fortesque bay, and form a complete barrier about three miles from the shore. The country in the vicinity is thickly timbered with valuable wood. Port Arthur has been for several years a penal station for convicts of the worst class; the prisoners' barracks at Safety cove, prettily situated on the sloping side of a point, are extensive, and strongly built. A guard of soldiers posted at *Eagle Hawk Neck* (the isthmus, only 120 yards across, which connects *Tasman's Peninsula* with the main land,) prevents all possibility of escape.

Between Cape Raoul and Port Arthur there are some remarkable chasms in the rocky coast, one of which is 127 feet deep, and very narrow; the sea rushes up it with great violence.

Cape Pillar, in $43^{\circ} 14' S.$, is so called from the strong resemblance which a portion of

it bears to the interior of a gothic cathedral. The basaltic rock is crowned with a thin stratum of soil, in which a few bushes and some grass have taken root; its sides are too steep for ascent. Although a good sea mark, it ought not to be approached too near, as a dangerous reef runs from its base to some distance seaward. Between Cape Pillar and *Tasman's island*—a black rugged islet, composed like most of the headlands on this coast, of a multitude of rocky columns—there is a passage of sufficient size for small vessels.

Fortesque or Dolomieu Bay, on the east side of the peninsula, is a small haven, with an entrance about a mile broad; a white, sandy beach, and good anchorage.

Monge or Pirate's Bay is large, much exposed, and separated at its head from Norfolk bay, by a very low and narrow isthmus.

Cape Surville and the east coast of *Forrestier's Peninsula* has a high and steep shore, on which the sea breaks with great violence.

Marion Bay is an extensive roadstead, with shelter only in the southern part, where *Port Frederick Henry* is situated, even for small vessels; landing is difficult, owing to numerous rocks and a powerful surf.

Cape Bernier, in $42^{\circ} 46' 5'' S.$, is conspicuous from its peculiar conical shape, rather than its height; the adjacent coast is indented with shallow sandy bights: to the northward it becomes steep, with six to seven fathoms close to it.

Maria Island (on which there is a probation station), is about twelve miles long, with an extreme width of seven miles. A low sandy isthmus, nearly overflowed at high tides, connects the mountain masses, which form its extremities. Of these, the northern is steep, 3,000 feet high, and remarkable for two immense rocks rising one above the other, called the Bishop and Clerk. The scenery of Maria island is romantic; the soil is described as generally good, and of great depth in the valleys. Several islets are situated in the channel which separates the island from the main land; the chief is the Lachlan or Middle islet, of an oval form, encircled by large rocks and shingle, without tree or shrub, but having its granitic base covered with fine long grass, said to afford excellent pasture for cattle. The soundings, on entering the channel from the southward, are twenty-five to thirty fathoms, decreasing very quickly to eight or nine, opposite to Oyster bay (the Oyster bay to the west of Maria island is

here intended, not that to the northward), where there is good and spacious anchorage.

Prosser Bay, opposite the north point of Maria Island, has deep water and shelter, but is unapproachable for large vessels, by reason of a great mud bank, with only six to nine feet water on it. Several streams, mostly of salt water, flow from adjacent marshes into this bay, which has no trees in its immediate neighbourhood: at a short distance in the interior, the usual prolific vegetation appears. A chain of mountains runs in a north-east, and also in a south-west direction, four or five miles from the coast.

Cape Bougainville, five miles to the north of the preceding, has a steep and almost inaccessible coast, with thirteen fathoms close to the shore: thence to *Cape Bailey*, the land is less elevated, but still steep and wooded, like that to the southward.

White Rock or Phogues (Seal) Island, opposite a small inlet named *Grindstone Bay*, was some years ago frequented by numbers of sea lions. A little to the north of Grindstone bay is *Little Swan Port*, a boat harbour, with a very shallow entrance, which receives a small river of the same name.

We have now arrived at *Oyster Bay*, a spacious opening fifteen miles long by ten broad, formed on the eastward by *Freycinet's Peninsula* and *Schouten island*, whose inner shores are low and wooded, though towards the ocean they present a steep, high, and forbidding aspect. The northern shore of the bay is sandy, and opens into *Great Swan Port*, at the head of which is an extensive lagoon, called *Moulting Bay*, the resort of numerous black swans.

Hazard or Refuge Island, on the west shore of Freycinet's peninsula, is of moderate height, well wooded, and contributes to the formation of a good harbour.

Cape Tourville is high;—from thence to beyond *Cape Lodi*, the coast is rocky and barren; towards St. Patrick's Head it appears to be well wooded, and near St. Helen's Point is characterised by several pyramidal points visible from a considerable distance inland.

Eddystone Point is more lofty than St. Helens, but from thence the mountains recede into the interior, and the 'iron bound' coast takes a north-west direction to Cape Portland at the entrance of Bass strait.

The north coast of Van Diemen's Island occupies an extent of more than 150 miles from Furneaux to Hunters Islands, and

forms a considerable curve intermediate between Cape Portland and Cape Grim, where-in is situated Ports Dalrymple and Sorell.

Cape Portland, the north-east extremity of Van Diemen's Island, in $40^{\circ} 44'$ S. lat., $147^{\circ} 56' 30''$ E. long., is low, with several rocky islets adjacent; the largest, *Swan Island*, is a narrow, hummocky strip of land, one-and-a-half mile long, distant about eight miles to the eastward. The shore east of the cape trends south in rocky heads and beaches; then curves to the westward, forming, with Point Waterhouse, *Ringarooma Bay*, which is seven miles deep and fifteen miles wide. There is a small haven in the bottom of the bay, into which the little and great *Boobyala* or Ringarooma rivers flow; both very small streams. Behind the coast, the eye wanders over apparently interminable woody ranges of irregular height, divided by scrubby gullies.

Waterhouse Island, four miles long by one-and-a-quarter wide, consists of beaches and rocky points rising abruptly to a moderate elevation, the level top being mostly covered with wood. From Point Waterhouse, the coast trends S. 67° W. five or six miles; thence south-south-west in a long sandy beach, subsequently curves to the westward and northward to west of Double Sandy point,—forming a deep bight about seven miles wide, off which lies Ninth Island, a small, level, verdant islet.

Double Sandy Point, is the joint name applied to two projections, closely resembling one another, though almost three miles apart; each overtopped with sandy hillocks,—a low barren tract stretching out in the back ground, and dividing them from the hills which approach the shores near Point Waterhouse. After another curve to the south and north-west, a very prominent bluff, connected with the mountain ranges, becomes conspicuous: it is termed *Stony Head*, and is in $40^{\circ} 58'$ S. lat., $147^{\circ} 8' 30''$ E., thirteen miles north, 65° east from Low Head, in $41^{\circ} 8' 30''$ S. lat., $146^{\circ} 47' 30''$ E., which, with *West Head*, five or six miles distant, forms the entrance of—

Port Dalrymple, situate at the mouth of the river Tamar, which above its junction with the sea, flows through a valley formed between two irregular chains of hills, which branch out to the north-west from the great mountain mass of the interior: these hills are, in some places, wide apart; in others they approach each other, and contract the tortuous channel of the river. Care is requisite in approaching Port Dalrymple, especially

from the northward; but the lighthouse on Low Head, a good pilot establishment there, and beacons on the most dangerous rocks inside, render the navigation comparatively easy; the worst reef, called the *Hebe*, after the ship of that name, wrecked there in 1808, is about a quarter of a mile wide. There are several islets in Port Dalrymple; that distinguished as the *Western Arm* is narrow, and not accessible for ships more than three miles; at the entrance the depth is not above three fathoms, but a mile above there are seven fathoms water. The *Middle Arm*, divided near the centre by Middle Head, has numerous shoals and mud flats, with only three fathoms in its deepest channel. *George Town* stands near the entrance of Port Dalrymple, on its eastern shore.

The *Tamar* estuary is navigable for large ships as far as *Swan Point*, three miles above *Middle Island*, but vessels of small draught proceed to Launceston, fifteen miles further. West of Port Dalrymple the coast trends west-south-west for nine miles, being generally low and sandy, with ridges of well wooded hills behind, and at the distance of nine to twelve miles inland, the Asbestos mountains are visible. At the eastern foot of this range is,—

Port Sorell, eleven miles to the west of Low head. The entrance is about one mile wide, but projecting rocks from both shores materially contract the navigable space. The port, after passing its entrance, is found to expand into a capacious basin, into the head of which a considerable stream, called the *Rubicon*, disembogues. Proceeding westward, we arrive at *Port Frederick*, which is narrow, and probably only available for small craft; the *Mersey* river and its tributaries, flow into it.

Immediately over *Dial Point*, twenty-nine miles from the *Tamar*, a peaked ridge rises abruptly. Between Port Dalrymple and this point, there are no less than five rivers, all with very short courses, and not navigable except by boats and small craft, and by those only in fine weather, on account of the surf on their bars. From *Dial point* to a peninsular projection, *Circular Head*, the coast trends N. 70° W.; and as far as *Rocky Cape*, the shore is steep and woody.

Emu Bay, ten miles from *Dial point*, is a confined anchorage, affording shelter from east winds, and receiving the *Emu* river.

Table Cape, fifteen miles north-west of

the preceding, is the cliffy extremity of a woody flat-topped eminence, visible thirty miles in clear weather from the deck of a ship.

Rocky Cape, intermediate between *Table* cape and *Circular head*, has a high pointed summit, with other peaks in the rear. The coast to the westward falls back, forming a sandy bight, into which several streamlets disembogue. *Circular Head*, is a cliffy peninsula, joined to the main by a low sandy isthmus. Rising abruptly from the water till its flattened crest attains an elevation of 490 feet, it looks like a huge round tower—while from the east, the connecting link not being perceptible, it appears entirely isolated—the more so, as the land at the back is somewhat lower, and undulates in very gentle slopes. The coast continues broken by numerous rocky projections from this point to *Cape Grim*, the north-west extremity of *Van Diemen's Island*, a steep, black head, in 40° 44' S. lat., 144° 43' E. long. On the north side of the cape the shore is low, trends in a sandy beach for three or four miles; to the south-south-west is a cliffy shore, with a depth of 120 fathoms, three miles off it.

ISLANDS IN BASS STRAIT.—Judging from the position and elevation of the islands at the east and west entrances of this strait (see general map of Australia,) it would seem that those at the eastern extremity are the visible links of a chain connecting *Wilson's* promontory in Australia with *Cape Portland* in *Van Diemen's Island*; and those at the western, *Cape Otway* with *Cape Grim*. The most important of these islands are included among the group situated at the western entrance of *Bass strait*, and named, strangely enough, in honour of *Captain Furneaux*, whose opinion concerning the non-existence of the channel in which they are situated has been recorded in a previous chapter.

Flinders or Great Island, the abode for several years of the exiled aborigines, is by far the largest of the *Furneaux* group, being about 130 miles in circumference. It is barren, and of forbidding aspect; a mountain range of 2,550 feet in height stretches throughout its whole length, bold and precipitous on its western face, but sloping gradually on the eastern, to a low scrubby plain much cut up with lagoons, and terminated by a sandy beach. The lower hills are clothed with timber, chiefly blue gum. The open grassy parts are not numerous,

but some portions are capable of cultivation. The wallabi abounds here, as do also various kinds of wild-fowl. (*Backhouse's Visit to the Australian Colonies*, 1832.) Three pyramidal hills, called the *Patriarchs*, rise conspicuously from the low land, and mark the eastern extremity of the island. A high peak in the south-west bears the name of *Strzelecki*. The northern point is placed by Flinders in $39^{\circ} 42' 30''$ S. lat., $147^{\circ} 53' 30''$ E. long.; by King in $39^{\circ} 47'$ S. lat.; and by Freycinet in $39^{\circ} 41'$ S. lat.

Several small islands, with reefs scattered alongside, border Flinders island, of which the largest, named *Hummock Island*, is between five and six miles long, and scarcely half-a-mile in width. It affords good shelter in westerly winds, and a plentiful supply of fuel. *Babel Islets*, the *Sisters*, and others, are little better than barren rocks.

Barren Island is divided from Flinders island by a channel four miles wide, thickly strewed with islands and shoals, its eastern entrance being almost blocked up with the sandbanks extending off five miles and a-half from *Vansittart* or *Gun-carriage Island*. Between *Capes Barren* and *Franklin*, its eastern and western extremity, Barren island has an extent of twenty-two miles, with a breadth of about five to seven miles. It well deserves its name, its denuded surface and jagged shores deeply indented with caves, and marked by strongly projecting headlands, present a picture of desolation which even the stormy weather so frequent in the strait can scarcely render more dreary. A peak at its eastern extremity rises 1,200 feet above the sea. *Armstrong Channel*, a passage about ten miles long, and from one to four wide, divides Barren from *Clarke Island*. In its western entrance lies *Preservation Island*, which owes its name to the preservation of the crew of a ship that run upon it in a sinking state. This and the adjacent islands abound in "mutton birds."

Clarke Island, which forms the northern shore of *Banks Strait* (one of the entrances to Bass strait), is six and-a-half miles long, by four and-a-half wide; rocky, and chiefly distinguishable by two rounded summits; the highest, 690 feet, resembling a saddle either from the east or west.

Chappell Isles lie to the westward of Barren island; the largest of them has a smooth round hill rising 500 or 600 feet above the level of the sea, which is rendered conspicuous by contrast with the low rocky isles around; it has a slight covering of herbage,

but in other respects appears (according to Flinders and others) nothing superior in fertility to the worst of Furneaux islands, and that is bad indeed. The smaller isles and islets in this vicinity it would be superfluous to particularize, the details connected with them having reference rather to sailing directions than general topography. Of the numerous small clusters scattered between *Flinders Island* and *Wilson Promontory*, the most remarkable are the *Kent Group*, of which the chief islands, named *Deal* and *Erith*, occupy a square of four miles, and are separated by *Murray Pass*, a channel half-a-mile wide. Conical granitic hills, in some cases clothed to their very summits with impervious scrub, are scattered over them. Captain Stokes describes the valleys on the north side of Deal as rich, and states that in one of them, leading from East Cove, he found a quantity of fine carrots, planted by some sealers; their seed having been carried by the wind till the whole valley was full of them. Besides East Cove, there are others on the north-east and south-east sides of this island; but on Erith there is but one, called West Cove, and that subject to violent gusts.

The *Hogan Group*—*Curtis Islands*—*Moncur Islands*, and several others, for the reason before given, it is not necessary to describe separately. How far they might be made available for settlers, or what seems more feasible, for convicts, is yet to be ascertained, but so far as we know at present, they are all bleak, rocky, and barren, offering little inducement except for fishing stations. Guano would, I should think, be found in abundance, and valuable minerals probably exist.

The western entrance of *Bass Strait* formed by the islands near Circular Head and Cape Grim on the north-west coast of Van Diemen's Island, and Cape Otway in Australia, is 108 miles wide. *King's Island*, nearly midway, occupies thirty-five miles of this space, and leaves to the northward a passage of forty-seven miles, and to the south one of thirty-seven miles; the southern is however much impeded by *Reid's Rocks*, the *Conway* and *Bell* sunken rocks, *Albatross Island*, and the *Black Pyramid*; the northern, between King's island and Cape Otway, has only three impediments: first, the *Harbinger Rocks*, N. 74° and N. 88° W., three and a-half to four miles from Cape Wickham, a round hill 594 feet high, on the north point of King's island; second, the *Navarino Rock* lying N.

25° W., one mile and-a-half from the same cape; and third, the reef lying half-a-mile off Cape Otway.*

King's Island (see general map, div. iv.) is thirty-five miles long from north to south, and twelve to fifteen miles broad; not very elevated, but with a few small eminences. A round hill at the north point, according to Flinders, is in 39° 37' S.; 143° 54' E.; according to Freycinet, in 39° 32' S.; 141° 42' E. The latter navigator makes the island about forty miles long, by eighteen miles broad. The western shore is described by Stokes as low, treacherous, and rocky, but good anchorage is found in a sandy bay on the north-west side, and likewise on the north-east side. The sand on the north-east coast is blown up in great ridges, partly over-spread and kept together by a kind of dog-grass; behind these the land rises in gentle elevations, covered with an almost impenetrable brushwood. A small lake of fresh water was found a short distance inland, surrounded by good vegetable soil.

Sea Elephant Bay, on the east side of the island, is a mile in depth, with sheltered anchorage, except when the wind is from the eastward. This haven used to be much frequented by sealers and other persons from Van Diemen's Island, for the purpose of killing sea elephants and seals, for the sake of their oil and skins; but the slaughter has been so great of late years, that these useful animals have almost disappeared both from this and other islands.

The *Hunter Islands*, near the north-west extremity of Van Diemen's Island, consist of three large, and several smaller islets. The principal, named *Hunter*, *Three Hummock*, and *Robins*, are mostly steep, rocky, and slightly elevated, with good anchorage in various places. *Hunter Island* was formerly named *Barren*, an appellation which it is described as fully deserving, being perfectly treeless, but overrun with scrub. *Three Hummock Island* received its name from three peaks on its eastern side, of which the most southerly rises abruptly from the water 790 feet. The whole island is clothed with an impervious scrub, which forms a perfect network. The trees are small and stunted. *Robins Island* leaves only a narrow boat-channel between it and the main, and has a small island close to its north-west extremity, called *Walker Island*, the two together forming an equilateral triangle, with sides of nine miles. *Perkins*

* Stokes' Voyages, vol. ii., p. 492.

Island, to the south-west of Robins island, forms the entrance to Duck bay, the inlet into which the stream of that name flows.

Albatross Island, the most northerly of the Hunter group, when first visited in the memorable voyage of Bass and Flinders, was densely tenanted—not indeed by men and women; for it is a strange fact, that *no aborigines were ever found on any island in Bass Strait*—but by seals, with whom Mr. Bass was obliged to fight his way up the cliffs, and albatrosses, among whom, when arrived at the top, he was forced to make a road with a club. These birds were sitting upon their nests, and deranged themselves only so far as to peck at his legs, in return for his unwelcome intrusion. Backhouse, who visited Albatross island in 1832, states, that above 1,000 were said to have been killed during the preceding year. *Steephead*, *Trefoil*, *Harbour*, the *Petrel*, *Penguin*, *Long Island*, and many others, with their different feathered denizens, need no separate notice.

NAVIGATION.—Bass Strait affords many good anchorages, several of which have been specified: its general navigation has been recently facilitated by the erection of various lighthouses; but before their construction, I passed from the eastward through the Strait, beating against a strong wind, without, I believe, more than ordinary precaution. In a line of soundings from Port Western (Australia), to Circular Head, the greatest depth midway was forty fathoms.

It may be useful to navigators to have the latest account published of the lighthouses in Bass Strait. The following is an abstract of the report of the late Captain Stanley, R.N., of her Majesty's surveying ship *Rattlesnake* :—

"1. *Port Dalrymple—Low Head*.—Base of house, 92 feet above high-water mark; centre of the light, 140 feet above the same level. Upper part, red; lower, white. Light, 15 lamps, revolving once in a minute. Admirably placed for leading vessels into the harbour.

"2. *Banks Straits—Goose Island* (one of the Furneaux islands), southern end.—Base of house, 30 feet; centre of light, 108 feet above high-water mark. Supporting column, 71 feet; and 24 feet in diameter at the base. Light, fixed, on the new principle, with a single lamp surrounded with lenses, and may be seen from a distance of 30 miles. The consumption is on an average a gallon of oil every night throughout the year. There is an officer and three men. Expense per annum, £292.

"3. *Banks Strait—Swan Island*, north end.—Base, 24 feet; centre of light, 104 feet above high-water mark. Supporting column, 71 feet, and 24 feet diameter. Upper part, red; lower, white. Light, very

good; same principle as at Goose island; a faint light constantly; a bright flash of two and a-half seconds' duration every five minutes; seen at Goose island (30 miles distant) in clear weather. On both these islands there is fresh water; provisions and stores are sent to the superintendent and the three men kept at each station, from Hobart Town, every six months. Expense per annum, £384.

"4. *Kent Group*.—Light-house about seven-tenths of a mile N. 10° W. (true) from the southern extremity of Deal island, which forms the east part of Kent group. Base, 829 feet; height to the lantern, 52 feet; whole height of pillar, 67 feet; upper half, red; lower, white. The light consists of 21 lamps, arranged in three sides, each containing 7 lamps; it revolves once in 54 seconds, and was seen from the deck of a small vessel 37 miles. Two substantial stone buildings for store and dwelling have been constructed near the lighthouse, which was commenced in April, 1846, and has cost for the building £1,840; for the lantern and five years' stores, £1,500 = £3,340. The great height of the lantern is considered by Lieut. Yule to be an objection, as the light is more liable to be obscured by fogs. There is water and firewood on the island, and pasturage for sheep. A superintendent and three men are maintained there at an expense of £484 per annum.

"On the Australian shore of Bass strait there is a lighthouse at the eastern and another at the western entrance. The former is on *Gabo Island*, five miles to the S.W. of Cape Howe, with which it is connected by a reef one mile and a-half long and three-fourths broad; the latter is on Cape Otway, 248 feet above high-water mark. The centre of the lantern 52 feet above the base. The entire cost of this light, including the erection of the lighthouse, keepers' quarters, and storehouses, and exclusive of the lantern, has been about £3,700. There is a lighthouse at *Shortland's Bluff*, Port Phillip, and another at *Point Gellibrand*, on the western side of Ilobson's Bay.

Eastern and Western Straits-men.—Before leaving Bass Strait, it may be well to notice the origin and habits of what may be called its *resident population*, which at some future day may probably be largely increased. From an early period after the establishment of settlements at New South Wales and Van Diemen's Island, the strait was frequented by a class of seamen called "sealers," who were placed on the different islands, for the purpose of catching seals, whose oil and skins they prepared for the vessels to which they belonged. Many of them became so attached to this wild mode of life, that when their ships were leaving the neighbourhood, they preferred to remain behind, receiving, in some instances, a boat and stores as payment for their work. Their numbers, also, were doubtless augmented by runaway convicts, who possibly prompted the daring forays made on either shore, to carry off the native women, frequently after severe contests with their natural protectors, who, it is however alleged, sometimes sold

them for seals' flesh, which they ate, the women themselves appearing glad to escape from their savage spouses, by whom they were treated literally as beasts of burthen. The poor creatures, in too many instances, benefitted little by the change of masters; at the best they fell into lawless and immoral hands, and in some cases appear to have been treated with cruelty. Such at least is the opinion of James Backhouse (of the Society of Friends), who visited Flinders island in 1832, when it was the abode of the exiled aborigines: he there conversed with several women who had been kidnapped by the sealers, but who, in different ways had escaped to the settlement; they told him of the manner in which they had been flogged when they did not pluck "mutton birds," or perform their other tasks satisfactorily; and one old woman, named Boatswain, spread her hands to the wall to show the manner in which they were tied up, and cried out with a failing voice till she sank on the ground as if exhausted! This tyrannical conduct was however probably confined to the runaway convicts, for ill-usage of anything defenceless, especially in female guise, whether old or young, civilized or savage, is notoriously inconsistent with the character of British seamen.

In process of time the sealers, or straitsmen, as they were called, when in consequence of the increasing scarcity of seals they no longer confined themselves to that pursuit, separated, or rather classed themselves into *eastern* and *western*, according to the position of the islands they respectively appropriated, more than two families seldom residing on the same.

Their habitations are generally of slab and plaster, rude, but tolerably clean and comfortable, for they have gradually obtained various necessities by barter from the whaling vessels that pass through the straits, or by means of a biennial visit to Launceston, from whence they never, it is said, bring back intoxicating liquors. The half-caste children have been previously described (p. 10) as a strong, bold race, of ruddy dark complexion, well adapted for sailors, and excelling as headsmen in whaling ships, where the keenness of their half-savage glance, and their dexterity in throwing the spear, make them invaluable as harpooners. Captain Stokes, who saw many of both the eastern and western straitsmen, speaks favourably of them in general, and especially

notices five-and-twenty children who were being brought up on *Preservation Island* and in its vicinity, adding, "their fathers, I am happy to say, give them all the instruction in their power; many can read the Bible, and a few write."

Preservation Island, when visited by Captain Stokes in 1842, was inhabited by an old sealer, named James Monro, known as the king of the Eastern Straitsmen, another man, and three or four native women; the embryo settlement comprising merely a few rude huts, with goats and fowls, and some cultivation around. Monro had then dwelt in this desolate place twenty-three years. A Captain Smith, who had met with a reverse of fortune, and fled from the abodes of civilized man, a few years since, took up his residence at King's island, with his wife, daughter, and three or four sons. In a slab hut, formed of boards, thatched with grass, this interesting family dwelt: their civilization manifesting itself, among other evidences, in the presence of a good library and musical instruments. This modern Crusoe subsequently returned to society, and is now, I believe, a comfortable settler in Van Diemen's Island. At *New Year's Island*, on the north-west side King's island, Stokes found an old English sealer living with two native women, who were clothed in very comfortable great coats made of kangaroo skins, and seemed quite contented with their condition. They assisted in working a whale boat adapted for the rough weather encountered in the strait by a canvass half deck, which being in the centre could be rolled up on the gunwale in fine weather.

The more available parts of the islands on which this mixed race reside have been brought into cultivation; grain thrives tolerably, potatoes, peas, cabbages, and other garden vegetables admirably. The chief occupation of the people, now that the kangaroo, wallabi, seal, and sea elephant have been almost entirely destroyed, is in catching the *sooty petrels*, called also the *Sheer-water* and the *Mutton birds*, from the fancied resemblance in taste of their flesh to that of sheep. These birds visit the islands annually in countless swarms, between the 15th and 20th of November, for the purpose of incubation. Each hen bird lays one or two eggs about the size of a goose egg, and somewhat similar in flavour. The male sits by day, the female by night, each going to sea in turn to procure its food. The nests

are made by burrowing two or three feet in the soft ground; and in favourable spots so close to each other, that in some of the islands it is scarcely possible to walk without falling, the surface being literally honey-combed. The native women collect the eggs and young birds, not however without danger, as venomous snakes are frequently found in the holes. When the sealers desire to take the birds in large quantities, a hedge is constructed sometimes half-a-mile in length, a little above the beach; towards daylight, when the male petrels are leaving their nests to go to sea, they run down towards the water, not being able to rise off the level ground. On being obstructed by the hedge they are driven by the sealers stationed at either end towards the centre, where a pit, several feet deep, is dug to receive them, and in which they smother each other. The birds are then plucked, the feathers carefully cured, packed in bags, and sent to Launceston for sale, when they bring about three-pence a pound. The feathers of about twenty birds weigh one pound, and Captain Stokes says he saw at one time thirty bags, the cargoes of two boats, and the spoil of 18,000 birds. Some of the petrels are preserved by dry smoking, and form the principal food of the islanders during part of the year.

A remarkable fact connected with this subject, noted by Backhouse and others, is the selection of different islands by different species of birds, in which they are doubtless directed by the various structure of the coasts. The albatross and petrel requiring a cliff or abrupt rise, from whence to wing their strong and long enduring flight, choose for their temporary abode rocky elevations; the penguin, which cannot fly, requires a low sloping shore, while some of the other species take possession of the small islands not occupied by those already named, simply because they are not inhabited by the carnivorous quadrupeds which, though not destructive to men, are so to birds.

The *Western and South-Western Coast* of Van Diemen's Island is characterized by mountain peaks and ridges, with gaps and fissures of every possible form, ever changing as the point of view is shifted. The inland lofty chains terminate in tremendous cliffs which project from two to four miles into the sea, at nearly equal distances from each other, with a breadth of about two miles, the little bays, with their sandy beaches, appear backed by dense scrub or arid

heaths. In sailing along this coast I was vividly impressed with the wildly grand character of these enormous buttresses, and the determined front which they present to the terrific storms and furious billows that assail them from the icy regions of the southern pole.

Resuming our examination of the coastline from Cape Grim, the point at which we left it, and proceeding to the southward, we pass a small bight called *Studland Bay*, then the *Mount Cameron* hills, and next arrive at the *West Point* of Van Diemen's Island, a sandy projection in $41^{\circ} 4' \text{ S.}$, $144^{\circ} 43' \text{ E.}$ From thence the coast extends south by east and south-south-east for nearly twenty leagues, and consists of sandy beaches, separated by points which have many straggling rocks lying off them to the distance of two miles. The shoreland is low for two or three miles, and then rises gently to a ridge of barren looking hills, backed by a higher and better wooded chain, from which rise detached peaks. *Arthur River* disembogues in an estuary about ten miles from West Point, of which I believe nothing certain is known.

Passing *Sandy Cape* and *Mount Norfolk*, which eminence is placed by Flinders in $41^{\circ} 24' \text{ S. lat.}$, $144^{\circ} 58' \text{ E. long.}$, *Mounts Heemskerk* and *Zeechaan* become visible; they form part of a lofty, irregular, and wooded range. Heemskerk, the most elevated, is sixteen miles north of Cape Sorell, and may be seen at thirty or thirty-five miles distance. Zeechaan bears from it $\text{E. } 20 \text{ S.}$, distant four or five miles, and has a peaked summit.

Macquarie Harbour, in $42^{\circ} 11' 30'' \text{ S. lat.}$, $145^{\circ} 16' \text{ E. long.}$, the principal haven on the west coast, was discovered in 1816; it extends inland in a south-west direction for about thirty miles, to the embouche of the Gordon river, diverging at its head right and left into two extensive coves or creeks, termed *Birche's Inlet* and *Kelly's Basin*. The entrance, which is very narrow, is formed by a moderately high bluff named Cape Sorell, in $42^{\circ} 10' 45'' \text{ S. lat.}$, $145^{\circ} 16' 30'' \text{ E. long.}$, on the south shore, and on the north by a long sandy beach. Nearly midway, in the mouth of the harbour, there is a small island or reef of rocks. The southern entrance, which is the best, is over a bar that extends for three-quarters of a mile outside the narrow part of the entrance, and has only nine feet water, on which the tide flows with great rapidity.

Inside, the depth of water is three to twelve fathoms, but there are extensive sandy shoals for more than four miles, among which are narrow channels shallowing in some places from fifteen to seven feet at low water. Further inland, the water deepens to ten, twenty, and twenty-six fathoms, for several leagues, where the shores run parallel with each other for more than fifteen miles.

The *Gordon River*, which flows into the bay near Birche's inlet, though barred, has two to seven fathoms within the entrance, and is navigable for thirty miles, in most parts very deep, and never less than 100 yards wide. The banks though generally precipitous, are in some places clothed with timber and shrubs, and exhibit beautiful scenery. The land is mostly rich, but so densely wooded with gigantic trees, as to offer little encouragement to agriculture.

Kelly's Basin has, near its northern extremity, a small river. There are several coves in Macquarie harbour, besides those already named, which may prove valuable, as the recent discovery of fine tracts of country, to the extent, it is stated, of at least two million acres, in its vicinity, will probably lead to the speedy location of this part of the island. The bar, the only material drawback in this magnificent haven, would then possibly be removed by scoops worked by steam power, as has been done at Port Adelaide.

Swan Bay, in the northern part of Macquarie Harbour, receives King's river; it is said to be a basin of considerable extent, in which vessels may lie completely landlocked; but very little is known of it.

Pine Cove has good anchorage in three fathoms, muddy bottom; the country around affords abundance of timber serviceable for various purposes; a tree of the pine species grows ordinarily to the height of forty or fifty feet, twelve to sixteen inches in diameter, with leaves resembling parsley, and affords excellent ships' spars. Lieutenant P. P. King, R.N., on landing here in 1819, found lofty trees growing within three yards of the edge of the water, upon a soil of decomposed vegetable matter, which in many parts was so soft that his party occasionally sank up to their knees in it. This swampy character arises from the thickness of these primeval forests, whose density prevents the rays of the sun from reaching the soil. The intelligent officer above mentioned, noticed near Pine cove a singular

evidence of the fertility of the district, and its adaptation for the sustenance of vegetable life, although in such a high latitude, and contiguous to the great Southern Ocean. After speaking of the magnificent forests, he adds—"The ground is also strewn with fallen trees, the stems of which are covered with a thick coat of moss, in which seedlings of all the varieties of trees and plants that grow here were springing up, in the prostrate stem of perhaps their parent tree; and it was not rare to see large Huon pines of three feet in diameter, rooted in this manner on the trunk of a sound tree of even larger dimensions, that had, perhaps, been lying on the ground for centuries; while others were observed, in appearance sound, and in shape perfect, and also covered with moss, which, on being trod upon, fell in and crumbled away." A stream called *King's River*, apparently of some length, flows into Pine cove. I think it will be found to water a valuable agricultural region to the eastward. The mountains along the eastern side of Macquarie harbour are not nearly so bare as those at Port Davey, further southward, the rock projecting above the soil only on the loftiest peaks, and the scrub of the gullies running into deep wood on the lower slopes. The shore open to the sea on the south, near Cape Sorell, consists of numerous small bays—some sandy, some shingly, others rocky, or covered thickly with decomposed kelp of enormous size, which engenders multitudes of maggots, the food of numberless white cockatoos, ducks, and other sea-fowl.

There was formerly a penal settlement on *Sarah Island*, a small island situated in the south-east side of Macquarie harbour. *Philip's Island*, on the north side, had then some garden cultivation.

From Cape Sorell the coast trends to the south-south-east, waving in rocky bights and projections; the land ascends gently from the shore, and is apparently destitute of wood.

Point Hibbs stretches westward about three miles from the coast, and being higher than the neck by which it is joined to the main land, presents an excellent position for a light-house. To the southward of this point, the coast trends more irregularly, acquires somewhat greater elevation, and becomes less bare of trees. About twelve miles from Point Hibbs, a small harbour is formed by two remarkable projecting

headlands. More to the southward is *Rocky Point*, thence the coast turns abruptly to the eastward, and *Mount De Witt* becomes visible at a distance of thirty to thirty-five miles.

We now arrive at *Port Davey*, ninety miles to the south-east of Port Macquarie, in 43° 21' S. lat., 146° E. long., an extensive inlet, discovered so lately as the year 1816, by Mr. Kelly, the skilful pilot of the *Dervent*, during an adventurous cruise in a whale-boat. This arm of the sea divides into two branches, one of which runs to the northward, with a moderate depth of water (three to six fathoms), and receives *Davey River*, a stream said to flow with great impetuosity from the Western Mountains; the other turns to the eastward, and forms *Bathurst Harbour*.

Backhouse was detained seventeen days in the "middle harbour" of Port Davey (see map); he describes it as a basin about a mile-and-a-half across, surrounded by hills with little wood, and sheltered from the open sea by a rocky islet and a conical rock, which leave an entrance "sufficiently deep for ships of moderate size." He adds, "we also went into the southern opening, called *Kelly's River*, which is an estuary five or six miles long, one broad, and from two to three fathoms deep. There were several black swans upon it. The wombat, a burrowing herbivorous animal, in figure somewhat like a small bear, abounds in this neighbourhood; its flesh, when young, resembles that of the hare. We likewise visited the Davey river, or Northern harbour, in which, under a point from the west, in the turn towards Cockburn cove, vessels sometimes take refuge from a southerly gale. Oysters are obtained at low tides in this cove, on the smooth waters of which, pelicans, red-bills, and gulls were swimming. On the north of it there is mica rock containing garnet." "Rock cod, and occasionally eels about five feet long and fourteen inches round, were caught there."

The *North Head* of the sea mouth of Port Davey is about 1,050 feet high, the shores on either side being of the most dreary and unpromising description, with a background of mountains which form a long tier, and stretch inland for several miles, attaining, it is said, an occasional elevation of 5,000 feet, and crowned with snow during the greater part of the year.

The following particulars respecting Port Davey, from the *New South Wales Monitor*,

though dated 1828, may be acceptable; for although this port and the coast to the South-west Cape is expressly stated to have been examined by Mr. Forsyth in 1842, in the *Vansittart*, during the surveying expedition entrusted to Captain Stokes, yet, strangely enough, no account of its capabilities or characteristics is given by the latter officer in his (on most points) comprehensive "Account of the coast and rivers" then explored.

"On entering Port Davey, the land on each side is of the most rugged and barren description, being steep and mountainous towards the east. As the traveller ascends, it gradually becomes narrower, till at last he finds himself, if in a boat, placed in a narrow but deep channel, in a chasm formed of perpendicular or overhanging rocky sides, reaching to so great a height as almost to exclude the light of day. The progress of the boat is at last stopped by its narrowness, not having room to ply the oars, and by a cataract of singular beauty. The water has evidently cut this channel for itself at some remote period; and having thus formed an outlet, has left the basin of the great lake which had formerly existed, a fertile plain above, of very large extent. The cargoes of Huon pine which have hitherto been brought from Port Davey, have usually consisted of logs and trees that have been washed down from this narrow chasm, and deposited on the sloping beach below."

The *South-West Cape* is a narrow piece of land projecting in two flattish hummocks from the main, and rising a thousand feet precipitously above the level of the sea; the peak in which it terminates is rendered more conspicuous by a deep gap behind. The white, weather-worn face of the cape is very striking, yet the adjacent coast is scarcely less wild, bare, and storm-beaten; high, denuded summits standing out occasionally from among the thick clouds that girdle them. Here and there, where vegetation struggles with sterility, its stunted growth and northern inclination testify to the bleakness and violence of the prevailing winds.

Cox Bight lies in the deep bay formed by the two projecting headlands termed *South* and *South-West Cape*. It was discovered in 1789 by Captain Cox, in the brig *Mercury*, and is situated north by west ten miles from the Mewstone. The country is said to be agreeably interspersed with hills and valleys, some of the hills being luxuriantly clothed with trees to the very summit. About four miles from where the *Mercury* anchored there was a stream of fresh water.

There is another inlet apparently extensive in the north-east part of this bay, close to *Peaked Hill*; it is reported to be a sandy bay, four miles deep, where it is probable there may be good anchorage, if two clumps

of rock which lie in the entrance will admit of a passage.*

De Witts or Maatsuykers Islands, so named by Tasman, are about twelve in number, of various sizes; the two largest are each three to four miles in circuit, with steep sides, but of a height inferior to that of the mainland, with which they have probably at one time been connected.

The *Needle Rock* to the westward, and the *Mewstone* to the southward of the above, are of the same character and formation. The Mewstone is nearly round, steep, and high.

The *Eddystone* and *Pedra Blanca* are two cliffy islets about twenty miles south of the *South Cape*.

The *Sidmouth Rock* is six miles north-east by east from *Pedra Blanca*. The channel between these islets and the mainland is thirteen miles wide, and near the middle the soundings are sixty fathoms on broken coral and shells.

The headlands of *South Cape* and *Whale Head*, with the intermediate open roadstead termed *South Cape Bay*, complete this necessarily cursory and unsatisfactory delineation of the coast-line of Van Diemen's Island, many parts of which are still very imperfectly surveyed, their latitudinal and meridional positions incorrectly laid down, and the capabilities of the havens and rivers in a great degree unknown. A limited portion of the colonial revenues could not be better employed than in making a trigonometrical survey of the entire coast-line of this remarkable island.

MOUNTAINS.—The range which divides the eastern from the western waters in Van Diemen's Island, is evidently a prolongation of that whose progress we have traced in the previous volume, through New South Wales and Victoria, to Wilson promontory, where its visible continuity, though in some measure interrupted by the sea, is yet clearly indicated by the chain of isles and islets in the eastern entrance of Bass strait, ordinarily comprehended under the name of the *Furneaux islands*; the *Hunter islands* in the western entrance would appear to be likewise the visible links of a submarine chain between Cape Otway and Cape Grim, but they are fewer in number, and the connection is far less evident. In the former instance, the course of the chain to Flinders island is distinctly marked by Rodondo, Moncur, Curtis islands, and the Kent group,

* *The Australian Directory*, printed by the Admiralty in 1830, p. 205.

while from thence to the southward, Barren island, Clark island, and Cape Portland are situated, with their respective heights, in such perspective that, shutting out the intervening sea, the eye may glide uninterruptedly from the heights of Flinders island, even to the far summits which crown the elevations of Van Diemen's Island. The chain, when it emerges from the ocean at Cape Portland, does not at once attain any remarkable altitude, its height for thirty miles not exceeding 700 feet. On arriving, however, at the point where it is commonly called Black-ridge, it suddenly rises to above 3,000 feet; and is seen casting to the right and left, in its south-west course, towards St. Patrick's head, three long spurs, which with their numerous ramifications, stamp the north-eastern section of the island with a most striking and characteristic configuration.

The first of these spurs branches off at the source of the river Boobiala, and terminates in a cluster of conspicuous granitic hills, of which the most prominent is *Mount Cameron*; next to it is that spur which is crowned with the greenstone elevations of *Mount Horror*, *Mount Barrow*, *Mount Arthur*, and *Mount Direction*, and which, stretching as far as George Town, terminates in *Mount Royal*. The third spur is characterised by the highest eminences in Van Diemen's island, namely, *Ben Lomond* and *Ben Nevis*, which are likewise composed of greenstone.

Count Strzelecki, who traced the great dividing range from Cape Portland to South Cape, and determined the position of the leading topographical features of the island, when describing the above-named spurs, says;—"it is impossible to give an adequate idea of the relief which they have produced; of those endless sharp-edged ridges, which run in all directions, interbranch and form, as it were, a net-work of mountain-chains, woven intricately together. At times the eye can seize upon their distinct and independent courses radiating from a common centre, and gradually sloping into flat-bottomed valleys; at times their flanks are erect and perpendicular, imparting to the ridges an appearance of having been rent asunder, and presenting between, dark chasms and gorges, from which roaring torrents make their escape."

The grandeur and infinite diversity of this mountain scenery is depicted as peculiarly striking, when viewed from the

lofty, craggy, and precipitous battlements of Ben Lomond, whose northern extremity, overhanging profound and tortuous abysses, commands an uninterrupted view of Ben Nevis, Mount Barrow, Mount Arthur, Mount Cameron, the northern coast, and the most conspicuous peaks of the islands of Bass strait. From the southern side is seen the whole eastern labyrinth of ridges and chasms, the fertile valley of the Break-o'-Day river, together with the beautiful outline of the bays and promontories of the eastern coast.

The central part of the summit of the mountain is a scene of unbroken solitude, silence, and desolation. On the bare earth, covered only here and there with patches of snow in the midst of summer, thousands of prismatic greenstone columns, of gigantic size (eight or ten feet in diameter), lie prostrate, columns chiselled by nature, and raised by her hands to this majestic elevation, where, overthrown and broken into huge fragments, their ends project over chasms 3,000 feet in perpendicular depth. From this table-land, however, of the mountain's top, the fearful gorges, precipitous cliffs, and inaccessible ridges of its immediate vicinity disappear; while the distant masses of the western hills seem blended or levelled into one undulating valley, intersected by the windings of glittering streams connected with the valley of the Tamar, and bounded, on the remotest verge of the horizon, by a delicately marked ridge of mountains.

The main chain at St. Patrick's head, recedes from the sea, and follows a south-westerly direction for about sixty miles, without presenting any particular features, either in its main or its lateral branches. At the point called Lake Tomb, and in the vicinity of the eastern marshes, it suddenly turns between these two localities, reaches St. Peter's pass, and casts towards *Spring Hill*, a spur, which separates the latter from the Clyde, and of which *Table Mount* is the principal eminence.

The dividing range next proceeds to the northward, where it passes between Lake Sorell and Lake Arthur. On arriving at *Dry's Bluff*, a remarkable elevation, resembling in shape a commanding promontory, it throws back again a spur, which encircles Lake Arthur, and thus flanks the left side of the Lake river, opposite to Miller's bluff.

The view from *Dry's bluff* embraces all the windings of the Tamar, with Ben Lo-

mond, Ben Nevis, Mount Barrow, and Mount Arthur in the background; the sinuities of the valley of the Meander, as far as the north coast; and the table land to the south, with the expanded waters of Great Lake, including vast verdant marshy plains, stripped of timber, plentifully intersected by rivers and rivulets, and here and there broken with ravines and elevations.

Between Dry's bluff and Western bluff, the chain, in its semicircular bend, sends one spur to the northward, which terminates in *Quamby's Bluff*, a remarkable detached round mountain, and several to the southward, which divide the lakes from the tributaries of the river Derwent. At Western bluff, it casts to the north-east a long spur, which separates the river Meander from the Mersey, rendering all the country which borders on Port Sorell and the river Tamar extremely broken and hilly. Throughout the whole distance from St. Peter's Pass to Western bluff the chain averages 3,500 feet in height, and exhibits a greenstone crest of an extremely irregular aspect. That crest is almost everywhere rugged, broken, and denuded of vegetation; its spurs steep, and tortuous in their course, angular and fantastic in their form; and its innumerable ravines, invariably deep and dry, are strewed with masses of rock of immense dimensions.

The dividing range to the southward of Western bluff assumes a still bolder character: its spurs in the vicinity of Lake St. Clair, to the north, north-west, and west, are topped for the most part by more lofty, bare, and cloven summits of quartz rock and sienite, and are divided by more gloomy gullies, the beds of which, furrowed by the torrents in yet deeper trenches, are at times impassable. The greenstone and basaltic spur which divides the Mersey from the Forth, that which separates the Forth from the Leven, that which spreads into the Hampshire hills, and stretches to Cape Grim, and, lastly, that which divides the river Arthur from the streams flowing into and towards Macquarie Harbour, all partake of the colossal, rugged, wild, and distorted features which here distinguish the chain.

Near the Hampshire hills is a ridge named the *Surrey Hills*, about 2,000 feet in height, from which rises *St. Valentine's Peak*, 4,000 feet above the sea, composed of siliceous conglomerate, the imbedded pebbles being of various appearance, from that of semi-opal to flint; others are opaque, and white, red, or scarlet.

Below Lake St. Clair, two remarkable spurs remain to be noticed; the one, which divides King from Gordon river, is crowned by *Frenchman's Cap*, a rugged towering point, so called from the resemblance of its snowy covering to that worn ordinarily by a French cook. The name, however, is ill chosen; for the scenery visible from its summit has nothing of the grotesque, but is described by Strzelecki as being of a "Pyrenean character, unequalled elsewhere in Van Diemen's Island." The other—also formed of greenstone and basalt, which separates the Derwent from the Huon, and terminates in Mount Wellington, constitutes a striking feature in the physical formation of the south part of the island. From both these spurs, elevated above all the adjacent mountains, the view is very extensive. Below the first, stretches the whole tract between Macquarie and Port Davey, a great part of the western coast, and the northern and eastern eminences of the Lake country. At the foot of the latter spur are seen, on one side, the conspicuous peaks of the elevated land about Lake Sorell, the Great Lake, Lake St. Clair, and Lake Echo, with all the numerous valleys which ultimately resolve themselves into that of the Derwent; on the other, the Coal-river valley, Tasman's Peninsula, and the borders of the Channel, with Hobart Town in the foreground, and the indented and projecting southern coast in the horizon.

The chain beyond these two spurs bends in a south-easterly direction, still sending forth minor branches, and studding with conical eminences the skirts of D'Entrecasteaux channel and Research bay, until it dips under the sea; thus terminating its terrestrial course at South Cape.

The following table, derived from Count Strzelecki's valuable work, shews the altitude, above the level of the sea, of the most remarkable mountains, lakes, water-courses, plains, and stations, in Van Diemen's Island, as determined by the barometer:—

Mountains.

Mount Humboldt, Western Range	5,520
Mount Ben Lomond, culminant point	5,002
Ditto North-west point	4,354
Ditto South Bluff	4,500
Cradle Mountain, north of Lake St. Clair	4,700
Dry's Bluff, Western Tier	4,590
Mount Wellington, Flagstaff	4,195
Mount Arrowsmith, between Frenchman's Cap and Lake St. Clair	4,075
Western Tier, opposite Mr. Groom's station	3,915
Ben Nevis	3,910
Frenchman's Cap	3,801

Black Range, Vale of Belvoir	3,381
Four Miles Rise, River Forth	2,957
Gad's Hill, River Mersey	2,588
Table Land, forming the base of Ben Nevis	2,327
Table Land, watered by the North Esk	2,220
Mount St. Patrick	2,277
Mount Stokes	2,039
Mount Herschell	1,200
Range between Mr. Whittle's farm and Watery Plains	1,506
Signal Hill (Mr. Kesmode's)	992
Asbestos Range	1,700
Mount Arthur	3,900
Badger's Head	1,300
Mount George, signal station	617
Sugar Loaf, near Mount George	642
Summit over Fourteen-miles Bluff	320
Government Cottage, George Town	23
Lantern of Lighthouse on Low Head	140
Mount Direction	1,233
Valentine Peak	4,000
Mount William	730
Mount Pearson	300

Lakes and Watercourses.

Great Lake	3,822
Arthur's Lake	3,388
Lake St. Clair	3,239
Source of the Nive	4,033
Source of the Leven	2,404
River Mersey (crossing place to V. D. L. Co.'s station	1,012
River Forth (crossing place, Circular Pond Marshes	796
Junction of the Tyne and South Esk	700
Junction of the North Esk, with a tributary from Ben Lomond	929
Junction of the two branches of River King	2,150

Towns and Stations.

Government hut at the Traveller's River	3,949
Sheep station of Mr. Wood at the Great Lake	3,822
Sheep station of Mr. James Clark, north of Marlborough	3,124
Bronte, Marlborough	2,912
Marlborough	2,858
Vale of Belvoir (V. D. L. Co.)	2,930
Middlesex Plains (V. D. L. Co.)	2,709
Government hut at foot of Frenchman's Cap	2,157
Chilton, a station of the V. D. L. Company	2,106
Regent's Plains (Mr. Wood's station)	1,892
Hampshire Hills (V. D. L. Company's station)	1,348
Oatlands	1,308
Circular Pond Marshes	1,140
Mr. Reid's farm	963
Caldstock	901
Captain Lloyd's farm, Westbury	800
Patcham (V. D. L. Company's farm)	839
Arundel, Western Tier	879
Coal Seam, Jerusalem	843
Formosa (an estate of Mr. Lawrence)	806
Mr. Legg's farm, Break-o'-Day	848
Mr. Groom's Sheep station, Western Tier	771
Adelphi (farm of Mr. Prinsep)	766
Lake Mills (farm of Mr. Fletcher)	725
Quamby's (the property of Mr. R. Dry)	691
Cressy (farm of V. D. L. Horse Company)	654
Blackman's Bridge	646
Jerusalem Settlement	634
Hummock Hill (Mr. T. Archer's station)	591
Carrick	560
Mr. Steiglitz's farm (Break-o'-Day)	577
Mona Vale (property of Mr. Kermode)	585

Campbell-town	567
Black Boy's Plain (Mr. Talbot's)	571
Eggleston (Mr. Headlam's)	549
Malahide (Mr. Talbot's)	431
Hamilton, town	346
Mr. Steill's St. Patrick	243
Rose Garland (property of Mr. Barker)	164
Mr. Hull's house, Mount Wellington	169
Risdon-house	150
Dr. Pugh's house, Launceston	142
Richmond-town	67
Ringarooma (property of Rev. Dr. Browne)	11

From the same authority we learn that the mean height of the *divisa aquarum* is 3,750 feet above the level of the sea. The average fall of the eastern rivers is estimated at ninety-three feet in every mile; and the average fall of the country, at 120 feet.

RIVERS.—The insularity of Tasmania, and the peculiar conformation of its irregular surface, give rise to many rivers and streams, of which some of the most important have their sources in the interior lakes; others originate in springs: but in both cases, though their volume is subject to sudden increase from mountain tributaries, it does not depend on them for support, and is not liable to be dried up in the warm months. I am aware that a different impression prevails in England on this point; but it is an erroneous one: for, making due allowance for its high southern latitude, Tasmania possesses a more than ordinary share of permanent surface water, distributed, so far as we know, (for there are some districts yet unexplored), very fairly throughout its whole extent.

The principal stream, called the *Derwent*, flows from the southern extremity of Lake St. Clair, about eighty miles to the north-west of Hobart Town, but the windings of the river give it nearly twice this length. Its earliest tributary is a stream, originating in a branch of the Western Mountains, which it receives on its left bank, five miles below Lake St. Clair; a rivulet named the *Guelph* shortly after joins it on the opposite side; thence continuing for fifteen miles in a south-east direction, the Derwent is joined by the *Nive*, which here terminates a course from the northward of about thirty-five miles, receiving only one small creek, the *Nivelle*, but fertilizing a considerable extent of fine country. After the junction of the Nive, the main channel receives from the southward a stream called *Florentine River*, whose source is supposed to be in the lakes at the foot of the Frankland range, in which the river Huon originates. Returning to

the Derwent, we find it pursuing its winding way through a chain of hills, from whence several mountain torrents (of which *Broad River* is the chief), descend to swell its stream; the *Dee* next joins it from the north, after a downward course from Lake Echo of about five-and-twenty miles, and shortly after, the impetuous waters of the *Ouse* and its tributaries form the most important accession which it receives throughout its course.

The *Ouse* has its rise near a remarkable eminence called Platform Bluff (see map of Van Diemen's Island), to the west of Great Lake, from the southern extremity of which its chief branch, the *Shannon*, takes its course, and after receiving two small streams, the larger of which, named *Blackman*, flows from the *Lagoon of Islands*, it joins the *Ouse*, near *Ebrington* township; from thence the united streams pursue a southerly direction, and after receiving the *Kenmere*, or *Native Hut Creek*, merge into the Derwent.

The rise of the Tasmanian rivers is generally rapid, owing to the mountainous character of the country; but the *Ouse* is especially subject to sudden floods, having been known to increase its depth above twelve feet in the space of two hours: this, of course, materially affects the Derwent, which, for a river connected with the sea, is remarkably uncertain in its rise and fall, and irregular in its volume.

Jones River next enters the Derwent from the foot of the ridge near Lake Barker; a little lower, on the opposite and northern bank, the *Clyde*, a far more important tributary, terminates a course which, including its sinuosities, may extend to some forty or fifty miles. Issuing from Crescent Lake, it for a short distance preserves a canal-like appearance, then rushes furiously over a rocky bottom: at one time it meanders peacefully amid rich and fertile land; at another, forces its way through steep gorges, or plunges headlong over precipitous cliffs.

Russell Falls, about ten miles below *Jones River*, the *Styz*, (whose present classic appellation, though in sound the same, is widely different in sense from that applied by its early visitors, when, seeing its channel nearly blocked up by fallen timber, they called it the *river of sticks*), and the *Plenty*, are small streams flowing into the Derwent from the mountain ridge which borders its right or southern bank, from whence the

Lachlan, *Sorell Rivulet*, *Humphreys*, &c., likewise descend.

On the opposite shore, the only branch of the main channel, of any importance, still unnoticed, is *Jordan River*, a clear, shallow stream, in dry weather little more than a chain of ponds, which, after watering a tract of exceedingly beautiful country, disembogues in an inlet called *Herdman's Cove*, situated near the head of the Derwent estuary, having been previously joined by *Strathallen Creek*.

I have elsewhere stated, that the fine river which we have now traced to its embouche, is navigable for large ships to Sullivan's Cove, Hobart Town; by smaller vessels, to about a mile-and-a-half above Elizabeth Town, or New Norfolk, where the channel is effectively barred by a ridge of rocks, chiefly under water, over which the river flows swiftly in a broken current (forming what is locally called the *Falls*); immediately above them the stream presents a deep and long reach, until again impeded by a similar obstruction. Locks and cuttings may probably hereafter render the Derwent practicable for a considerable distance inland. The Upper Falls, in the earlier course of the river, (before the accession of the *Dee*), are much more striking, the water precipitating itself in an unbroken volume over a ledge of rocks of considerable height, and forming, during the rainy seasons, a really magnificent cascade.

The waters of the Derwent are fresh for some distance below Elizabeth Town, although slightly influenced by the tide.

The *Tamar*, is the name applied to a part only of the main artery, whose ramifications spread over the north-eastern portion of the island, as the Derwent and its branches over the central and south-western, but the *Valley of the Tamar*, properly so called, may be considered as commencing at the head of Macquarie river, from whence to George Town, it has, according to Strzelecki, "a length of 100 miles, an average breadth of thirty, and a superficial extent of 3,000 square miles. It has forty miles of inland navigation for vessels of 600 tons, and the best macadamised roads cross it in every direction. Its sides are prominently indented with bold erect ranges of greenstone, which, under the progress of disintegration, are yielding to its soil the most valuable elements of production." In addition to these advantages, the same authority notices especially the advantages of its position

with regard to *Lake Arthur*, which lies above it at an elevation of 3,700 feet, forming a natural reservoir for irrigation.

The section, however, of this valley, especially distinguished as the Tamar, commences, or rather, is formed by the confluence of the *North and South Esk*, at Launceston, and after winding through a channel, usually narrow, but of varying width, between shores sometimes high and densely timbered, at others low, and offering to view an extent of forty miles of open country, abounding in rich pasturage, and receiving on its way the waters of the *Supply River* and some smaller creeks; it disembogues at Port Dalrymple in Bass Strait, after a course, including its sinuosities, of forty-five miles.

At twenty miles from the sea, the breadth of the Tamar is about a mile, but towards the entrance it varies from one to five miles, forming several inlets peculiarly adapted for docks and ship-building; for the latter there is great inducement in the abundance and excellence of the materials readily obtainable in its vicinity. Though its *Valley* is superior in an agricultural point of view, as affording a larger proportion of readily available land, as an *estuary* the Tamar will not bear comparison with the Derwent; its navigation, which has been before alluded to in describing the Coast Line (p. 27), being intricate and dangerous.*

The *North Esk* originates in several springs which flow from the mountain range to the northward of Ben Lomond, and is likewise fed by some tributaries from the foot of that eminence. During a course of about thirty-five miles it receives only one small stream, called *St. Patrick's*, and a few creeks, but it passes through an exceedingly rich country, and its banks are, to a considerable extent, lined by thriving farms.

At Corra Lin, about seven miles from Launceston, the North Esk forms a pretty waterfall, which prevents the further progress of boats and barges.

The *South Esk* rises near the northern boundary of Cornwall County, and forms a junction with *Break-o'-Day River*, near Fingal township; then flowing to the southwest, receives several rivulets; *St. Paul's*

* "The first appearance of the Tamar," says Captain Stokes, "is not very inviting to the seaman. A rapid stream, thrown out of its course, hemmed in by numerous reefs, and passing over a bottom so uneven as to cause a change in the soundings from twelve to twenty-six, and then eighteen fathoms, with a ripple or line of broken water across the mouth, renders it impossible in strong north-west winds, for a stranger

River, joining it near Avoca, and *Buffalo Brook* on the opposite bank; soon after, taking a north-west direction, the South Esk divides the counties of Cornwall and Somerset, receiving on its way *Ben Lomond River* and *Nile River*, and subsequently unites itself near the township of Perth to Macquarie river, which is in fact its main stem.

Macquarie River, remarkable for the fertile tract of country which it waters, rather than for its own extremely uncertain stream; has its origin near the source of the Clyde and Jordan (tributaries, it will be remembered, of the Derwent), thence taking a north-west course across the county of Somerset, and receiving *Blackman River*, *Elizabeth River*, the *Isis* and other periodical streamlets, it forms a junction with *Lake River* (which has obtained its name from the numerous reaches or lakes formed during its meandering course), at a point a few miles below Perth, and then flows onward to its union with the South Esk.

The waters of the *Quamby*, *Meander*, or *Western River*, with its tributary creeks, soon after enter the left bank of the South Esk, which about half-a-mile before its termination in the Tamar, forms, when in full volume, an imposing cataract; to this point the salt-tide flows up; the ebb and flow are regular, the rise being about fourteen feet at Launceston.

The river next in importance to the Derwent and Tamar is the *Huon*, whose embouche was described among the havens of D'Entrecasteaux channel. At twelve miles from its sea mouth the Huon receives on its right or west bank, a small stream called the *Kermadec*, and twelve miles further inland the *Mount River*, which flows from the Wellington range: the tide runs up as high as this junction, but the navigation is impeded by the Egg islets, which are covered with trees, brush-wood and long, grass, affording shelter for numerous swans to build their nests.

Above the Egg islands the channel is still narrow, but the water deepens to ten fathoms, and remains so to Mount river, whence there is a good road to Hobart Town, to detect the channels, and raises so much sea that the pilots cannot reach the vessels that arrive off the mouth." (Vol. i., p. 279.) Elsewhere he states that "on the whole of the northern coast, with the exception of the Hunter Islands, there is no place of safety for a ship in all winds, that a stranger would like to run into, the mouth of the Tamar being too much occupied with shoals." (Vol. ii., p. 503.)

distant fourteen miles. The Huon now takes a sudden turn to the west—the angle of the bend is termed *Mosquito Point*; the northern or left bank continues lofty and precipitous; the opposite side is composed of low land often flooded. About a mile above Mosquito point, the river is nearly 100 yards wide, and the first fall is met with; the stream then forms a succession of rapids to its sources. *Lakes Maria and Edgar*, situated near the eastern extremity of the Frankland range. *Picton River*, said to flow from a lagoon to the east of Bathurst harbour, joins the Huon about midway; but with this stream, as indeed, with the far more important one, to which it is a contributory, we are very imperfectly acquainted. Dense woods, consisting chiefly of the fine trees distinguished as Huon pine, from having first been found on the Huon river, render its shores in parts almost inaccessible, but in others there are said to be available tracts of extraordinary fertility.

Some miles to the north-westward of the sources of the Huon, a considerable but only partially examined river, named the *Gordon*, takes its rise; at the upper part of whose course, lime, which is rare in Tasmania, and, consequently, very valuable, is found. The Gordon is navigable for about thirty miles from its embouché in Macquarie Harbour (see p. 32). It receives *Spencer's Rivulet* and other streamlets, which are, I believe, unnamed. Another stream called *King's River*, said to be little inferior in length to the Gordon, empties itself into Swan bay, the northern inlet of Macquarie Harbour.

Numerous streams with short courses, flow into or towards Bass strait. At the distances of eight, eighteen, twenty-nine, forty-eight, and fifty-three miles eastward from Port Dalrymple, the *Currie*, *Piper*, *Trent* or *Great Forestier*, *Tomahawk*, and *Ringarooma*, (*Little and Great Boobyala*), disembogue into Bass Strait.* Westward of Port Dalrymple, at the distances of

eleven, eighteen, twenty, twenty-three, and twenty-seven miles, and all flowing from the southward, are the *Sorell* or *Rubicon*, the *Mersey* and its tributaries, the *Don*, *Frith*, and *Leven*, of which the Mersey and Rubicon are the principal. Westward of the Leven there are also several streams, viz.—the *Blythe*, *Emu*, *Coey*, *Cam*, *Inglis*, *Flowerdale*, *Detention* or *Tret*, *Hook*, *Greg Fish*, *Copper Ore*, *Black*, *Duck*, *Montague*, *Welcome*, &c. Count Strzelecki, who traversed the north-western extreme of Van Diemen's Island, between Circular Head and Point Woolnorth, describes it as presenting "eight rivers as difficult to cross as the Scamander, with deep gullies and rocky ridges, and marshes more difficult to overcome than either ridges or rivers." A similar feature marks the western portion of the island. One, named the *Arthur*, which disembogues ten miles to the southward of West Point, appears to have a course from the eastward of more than sixty miles, and to have several tributaries, termed the *Frankland*, *Horton*, *Leigh*, and *Balfour*. The *Hellyer*, *Mackintosh*, *Coldstream*, *Forth*, *Huskisson*, *Medway*, and other streams, are traced to some extent in the north-western portion of Frankland's large Map of Van Diemen's Island; but their sources or termination are not clearly defined.

The south shores are less indented with rivers than any of the others, excepting the more important streams previously named, there are none worth particularizing; on the east coast they are more numerous, but not of magnitude to require specific notice. Among them are included *Coal River*, the *Blackman*, in Tasman's peninsula, *Prosser*, *Little Swan Port*, *Wye*, *Cygnets*, *Break-o'-Day*, *Scamander*, *Georges*, *Ansons*, and *Great Muscle Roe*. The chief of these, named the *Coal River*, has its source near Three Hills, in Jerusalem plains, takes a southerly direction through a fertile country known as the Sweet Water Hills, receives the *Kangaroo River*, and empties itself into *Pitt Water*, an extensive salt

* Mr. Henry Widdowson, who was shipwrecked in the neighbourhood of the Ringarooma river, says it has a bar at its entrance, over which he thinks small vessels could easily pass during a flood tide; the mouth of the river is 100 yards wide, and gradually opens, says Mr. Widdowson, "into one of the most beautiful basins I ever saw. This fine sheet of water appeared the rendezvous of hundreds of black swans, wild ducks, and pelicans; the surrounding banks were covered with cherrytree and other small shrubs; altogether it had much the appearance of a piece of

water formed to adorn the park of some nobleman in England." The explorer proceeded one day's journey up the river; for thirty miles the land appeared to be good, but as it was the winter season, and evidently below the level of the river, he feared it would be inundated; advancing further towards the mountains, the river became regularly narrower, but Mr. Widdowson, being unarmed and afraid of meeting with the natives, did not continue his explorations. The description he gives of the Ringarooma will answer for several other rivers on this coast.

lake which communicates with North bay.

LAKES.—In a region of very varied altitude, receiving annually a large supply of rain, there are necessarily many inland sheets of water; but the greater number have as yet been imperfectly explored, either as to their exact position, extent, or depth. Little, therefore, can be done beyond indicating the leading characteristics of those best known.

Great, or Clarence Lake, ninety miles north-west of Hobart Town, is about fifteen miles long, by five broad, but the deep and continuous indentations of its shores give it a circumference very disproportionate to its limits, and conjectured to be little less than 150 miles; its depth, which is extremely variable, is differently estimated, but in no case with any pretension to accuracy; its height, above the level of the sea, is 3,882 feet. There are five islets in the lake, covered with a species of cedar, and numerous shrubs: the country in the vicinity is not thickly wooded, but composed of alternate marsh and hills, offering many tracts available for sheep and cattle runs, while in the distance the landscape abounds in the picturesque adjuncts of mountain and forest. A local historian, Mr. David Burn, speaks of its "woody islands and glittering bays" with rapturous admiration. "England," he says, "may vaunt her Windermere; Scotland chaunt the beauties of Loch Lomond; Ireland proclaim the graces of Killarney; but not with truer or prouder tongue than Antipodean Tasmania may boast the mountain glories and glowing waters of her own sweet lakes, than which none is fairer or sweeter than the majestic Clarence." The lee-shore of the lake is protected by a singular natural breakwater from the fury of the winter winds, and the causeway is nearly as regular as if constructed by masonic art.

The *Shannon* emerges a full-grown river from the broad expanse of *Great Lake*, whose waters nevertheless, in some parts, overflow their borders, even during the warm months: after rain, they of course rise considerably; and during tempestuous weather, occasionally wear a turbulent aspect, quite at variance with their ordinary tranquil beauty.

Lakes St. Clair and Sorell, in which the rivers Derwent and Clyde respectively originate, are next in size to *Great Lake*. *Lake Sorell* has high land close to its shores,

with here and there fine pebbly beaches, and it is divided by a narrow strip of land from *Lake Crescent*, a smaller sheet of water, to the south-east of which the remarkable eminence called *Table Mount* rises in the distance. Near *Lake Sorell* lie *Lake Arthur*, *Lake Woods*, and *Boundary Lake*, the sources of *Lake river*; and the *Lagoon of Islands*, a picturesque piece of swamp-water, in which numerous clumps of lofty bulrushes spring up from mounds of bog and long grass, variously grouped.

Lake Echo, whence issues the river *Dee*, lies immediately to the south of *Great Lake*, to whose irregular outline, its gently waving shores form a striking contrast; while its fairy islets, flowery banks, and clear blue waters, render *Lake Echo* perhaps even more attractive than its majestic rival.

The above lakes are all situated in the plateau formed by mountain ridges in the interior of the island; they are said to abound in water-fowl, and some of them in fish, but on this point I cannot speak with certainty; indeed I may here state that I have found more difficulty in obtaining accurate topographical information concerning Tasmania generally than any other of the Australian colonies.

Lake Tiberias is situated in Monmouth county; in the centre of that of Buckingham are several lakes, of which the largest is *Lake Barker*, at its western extremity are *Lake Pedder*, (three miles and-a-half long by two and-a-half broad), and *Lakes Maria and Edgar*, the sources of the *Huon*. According to Frankland's map, dated 1839, there is a communication between *Lakes Pedder and Maria*, not marked in the later ones.

Lemon's or Jordan Lake, twenty-five miles north of Hobart Town is encompassed by high hills. It is of a circular form, about ten miles in circumference, and except in wet weather very shallow.

DIVISIONS.—Tasmania was originally divided into two counties, Buckingham and Cornwall; the former occupying the northern, the latter the southern half of the island; and these counties were subdivided into police districts. This partition remained in force until June, 1836, when a redivision of the island, or rather of the eastern and central portions, was duly proclaimed, and the boundaries of eleven counties established. Of these, the *northern* were named Devon, Dorset, and Cornwall; the *central*, Westmoreland, Somerset, Gla-

morgan, and Cumberland; and the *southern*, Kent, Buckingham, Pembroke, and Monmouth. The limits of forty-nine townships and 155 parishes, comprised within the above-named counties, were fixed at the same time; but it is not necessary to enumerate them, as the greater number have as yet little more than a nominal existence. The counties themselves are rarely alluded to, either in the local enactments or statistical returns; the police districts, into which the settled tracts are apportioned, being alone mentioned.

In subsequent tables, the area, amount and description of cultivation, population, and stock, in each district, will be shewn. To avoid repetition, I shall therefore only notice, in this place, the leading topographical features of the country.

Hobart Town and the surrounding country.—The capital of Tasmania is situated in 42° 55' 13" S. lat., 147° 21' E. long. It occupies a commanding and extremely picturesque position, on the right bank of the Derwent, about twenty miles from the sea, at the head of the sheltered bight named Sullivan's Cove. The town is remarkably clean, well laid out, and neatly built; it covers from a mile to a mile and-a-half square of gently rising ground, backed by an amphitheatre of lofty and well-wooded hills, having Mount Wellington as the highest, which shelters it from westerly winds, and bound the horizon on that quarter; while the magnificent estuary of the Derwent—here more properly an arm of the sea, from its width and the saltness of its waters—with its shipping of various descriptions, and its picturesque points of land forming numerous bays and lakes, skirts it on the east. The streets cross each other at right angles; they are airy, well lit, and tolerably wide; those that have been levelled and macadamized, of which there are several, present rows of good houses and handsome shops; the former being most numerous in Macquarie-street, which contains many of the public buildings and the dwellings of persons in official employments; the latter, in Elizabeth-street.

Macquarie-street, and the road continuing from it for a distance of about two miles, runs in a line nearly east and west, over two or three small hills, from the quay to the Female Penitentiary, until it is lost in a thick woody ravine at the foot of Mount Wellington. Elizabeth-street runs north and south, extending from the Go-

vernment-house towards New Town, on the Launceston road, in a continuous line of about a mile.

The houses and stores constructed of late years are chiefly of brick or a dark-coloured freestone, abundant in the neighbourhood, and roofed with shingles, which have the appearance of slates; but the older erections are principally of wood. It is, however, only in the leading thoroughfares, where the ground is most valuable,* that the houses offer anything approaching uniformity in their appearance: they usually stand apart, each having a small plot of ground, varying from a quarter to half an acre in extent, attached to it; a circumstance which, together with the undulating nature of the surface, adds materially to the beauty of the town, compensating in some degree for the deficiency of trees, either for ornament or shade, occasioned by the exterminating "clearings" of the early settlers.

A rivulet named *Hobart Town Creek*, originating near the foot of Mount Wellington, runs through the town, and disembogues in the Derwent, affording, during certain periods of the year, a good supply of water, and working several flour and saw mills.

The water is distributed by means of metal pipes, laid down by the government, by the aid of convict labour. Some quarters of the town are said to be but indifferently watered; but this is by no means a general complaint, and the shipping especially has been well cared for.

The public buildings are numerous, and some of them are handsome and commodious, more especially those devoted to the celebration of divine worship,—St. David's cathedral, Macquarie-street; St. George's church, at Battery Point; Trinity church, in Campbell-street; a chapel in Goulbournestreet, and St. Patrick's cathedral, in Patrick-street, for which subscriptions were raised in England, and a peal of bells purchased; all belong to the Church of England. There are besides, the Presbyterian kirks, various chapels and meeting-houses belonging to different denominations, and a Roman Catholic chapel: there is also a Jewish synagogue.

The Government-house is a large irregular pile, originally planned upon an inconsiderable scale, and added to as necessity required; it stands in the midst of tastefully

* There are spots of land in Hobart Town worth £2,000 per acre, which not many years since sold for as many shillings.

laid out shrubberies, and commands some delightful views of the port and river. A new house was commenced by Sir John Franklin in the government demesne, but it has not, I believe, been advanced beyond the foundation. The Court-house is a commodious building of hewn stone.

The Female House of Correction, or the Factory, as it is commonly called, is an extensive building, whose admirable construction affords facilities for the classification and employment of the prisoners; the gaol, on the contrary, is remarkable for its inaptitude for the purposes for which it was designed, being insecure, and too often crowded; so much so, that formerly debtors and editors of newspapers confined for libel or political misdemeanours, have been the compulsory associates of capitally convicted felons.

The Military and Prisoners' Barracks, standing in separate quarters of the town, are large and substantial edifices of brick, the former building, especially, occupies an excellent position, and is both healthy and convenient.

The Custom-house is of pure white free-stone, it stands near the commodious and well supplied market-place, in the north-west angle of Sullivan's Cove. The Commissariat Stores, Police-office, Colonial Hospital and other buildings, it is not necessary to particularize; they are of the substantial character common to the chief towns of the Austral-Asian colonies. Towards the end of 1840, a Magnetical Observatory was established in the government demesne, Hobart Town, by Sir James Ross, and fitted up by him with the best instruments for magnetic, astronomical, and meteorological observations; it is one of a series of forty, extending from Hammerfest, in Norway, in 70° N. lat., to the above-mentioned spot, which is in 42° 55' 13" S. lat.; 9 hours, 49 minutes, 85 seconds E. of Greenwich, which is in 51° 28' 32" north lat. Great Britain now numbers twelve observatories, namely, those of Greenwich, Cambridge, Dublin, Kelso (the private one of Sir Thomas Brisbane), Simla, Madras, Singapore, Bombay, Toronto, St. Helena, Cape of Good Hope, and that before-named, in Tasmania. All the observations at each station are made at a corresponding moment of Gottingen mean-time; the university of Gottingen having originated the enquiry, and being the common centre. One of the main objects for which these establishments

have been created, is to settle the question whether the constant perturbations to which the magnetic needle is subject, are local, or of an universal character throughout the globe.

The distinguishing advantage of Hobart Town is its fine harbour, in which ships of any burthen may not only safely ride at anchor, but may lay close alongside the shore in any state of the tide, which here seldom rises above four, or at most, five feet, and discharge or receive their cargoes: this great convenience has been obtained by the exertion of no small amount of enterprise and perseverance.

When Colonel Collins first debarked in February, 1804, a small patch of ground called Hunter island, lay at the mouth of the Hobart Town creek, contiguous to the anchorage. The water on this shore shoaled rapidly, rendering the operation of un-lading both tedious and hazardous; it was therefore deemed expedient to connect the islet with the mainland, by a causeway upon which a series of substantial and commodious warehouses were constructed: a wharf was likewise formed, and although ships could not discharge alongside, still vessels of 100 tons were enabled to do so, and the water was materially deepened. Notwithstanding this, an evil still existed, inasmuch as the cargoes of traders had to be transferred either to their own launches, or to shore boats, in which they were frequently damaged by the surf consequent upon the strong sea-breeze: to remedy this inconvenience, the construction of another wharf was resolved upon. The western shore of Sullivan's cove, terminating in the rocky point on which stands the little fort, dignified by the name of Mulgrave Battery, with its telegraph and signal post, offered considerable facilities, the banks being by no means of difficult removal, and presenting an ample supply of road and building material; whilst the water was not only smooth, but of considerable depth. The work once commenced proceeded vigorously; the waters of the upper and northern part of the inlet which were shallow and valueless, were filled with the excavations, and a magnificent esplanade connecting the old and new wharf, and consequently the whole harbour, was forthwith constructed.* The carriage way from Battery Point, west, to Murdock's Point, east, may probably be an

* *Colonial Magazine*, Van Diemen's Land, by David Burn, Esq. (Vol. ii., p. 283.)

English mile; on it are numerous warehouses of hewn stone, each erected at a cost of many thousand pounds.

Along the water-side are ship and boat-building yards, whence, from time to time many brigs and schooners for the colonial trade are launched into the land-locked waters of the Derwent.* The Tasmanians in general are thoroughly British in their tastes and habits, and evince this similarity in nothing more strongly than in their genuine enjoyment of aquatic amusements. The first settlement of the island in 1804, is annually commemorated by a regatta, held at Hobart Town in December, usually the finest month in the year.

The principal buildings erected by private capital in Hobart Town are the banks (which I shall elsewhere have occasion to notice, as also the schools, charitable and stipendiary), several excellent hotels and other houses of entertainment, among which may be included a more than proportionate number of "grog shops," but these have diminished since the establishment of abstinence and temperance societies.

Among the manufactories may be noticed breweries, tanneries, founderies, timber-mills, flour-mills, worked by the different elements of wind, water, and steam, a pottery, and a sugar-bakery. There are besides several coach-makers and every description of cabinet and furniture makers; ship-building has also now become a large and lucrative occupation. Hobart Town may be said to be well and reasonably supplied, not with necessities only, but even with luxuries. The only commodity of which a scarcity is felt, is fish, and that I believe is in consequence rather from the class who might procure it being engaged in more easy and equally remunerative pursuits, than in the deficiency of the article itself.

Mount Wellington, a chief object of attraction to the traveller visiting this the most southern city of the British empire, rises 4,000 feet above the level of the sea; the base of the mountain commences about four miles from the harbour, from which the summit is distant nine miles. A road extends from Macquarie Strait to a considerable fall of water called the "Springs," half-way up the mountain; beyond this point there are huge rugged rocks abounding in marine fossils, and separated by ravines and gullies, and the somewhat oval-

shaped sloping summit buttressed by fluted columnar basaltic masses, several hundred feet high (see map), seems like the landing-place of a long chain of progressive steps or elevations. Mount Wellington does not present the frowning grandeur and barren aspect of Table Mountain at the Cape of Good Hope, for although capped with snow during eight months of the year, the lower slopes towards Hobart Town are thickly studded with fern trees, wattles, and eucalypti, with an undergrowth of the castor oil plant, and many flowering shrubs, some of which possess considerable beauty.

The excellent roads of Hobart Town were repaired by the convicts at the expense of the government until 1846, when it was divided into five wards; commissioners were elected by the inhabitants, and the town assessed, the government on its part relinquishing some wharf dues and other taxes.

The land in the vicinity of Hobart Town is hilly and densely wooded, and the soil is stated to be generally thin and poor, yet some of the most unpromising tracts have been brought into successful cultivation, and the commodious and often handsome villas of the merchants and traders who carry on their respective occupations in the Tasmanian metropolis, stand amid gardens in which all kinds of English fruits thrive luxuriantly; while on the woody hills around patches of fresher green, with here and there a whitewashed cottage, enliven the dense masses of forest, composed chiefly of gum-trees (*eucalyptæ*), whose olive-brown foliage, gnarled trunks, and shedding bark of a changing ash-grey colour, form an almost invariable feature in every Tasmanian landscape.

On either bank of the Derwent, both above and below the town, are pleasant dwellings and agricultural farms, and immediately facing it on the opposite shore, is a low wooded tongue of land named *Kangaroo Point*, with a deep bay on either side, upon which a small village is situated, between which and the capital constant steam-communication is kept up from the circumstance of Kangaroo Point being the principal route to Sorell and Richmond.

Sandy Bay, a suburban dependence of Hobart Town, is delightfully situated at the head of the bight (about two miles in extent) whose name it bears; it is sheltered on the east and south by Mount Nelson, which runs abruptly into the river, closing all further view of the coast on that side.

* *Twelve Years in the British Colonies*, by J. C. Byrne.

On this eminence (1,000 feet high) is a signal-post, communicating with Mulgrave battery, and announcing the first intelligence concerning the arrival of vessels.

The productive farms and gardens of Sandy Bay, its race-course, and the broad lake-like expanse into which the river here opens, have rendered it a favourite resort. A thriving village named,—

New Town, on the opposite or northern side of Hobart Town, from which it is about two miles and-a-half distant, stands upon the banks of a small rivulet flowing into one of the numerous bays formed by the Derwent. The natural advantages of this spot, both with regard to scenery and soil, early attracted attention, and grants of the land in its immediate neighbourhood were obtained by the first settlers. The houses generally, are built in a superior manner, extensive quarries of fine-grained freestone being immediately available, and to several of them tastefully laid-out shrubberies are attached, the extensive gardens and orchards are highly cultivated, and the commodious farm-houses, with their neatly enclosed fields and paddocks, can hardly fail to strike an English eye as peculiarly home-like.

This locality appears extremely favourable to the growth of the vine, and so long ago as 1830, Prinsep, in his "Journal of a Voyage from Calcutta to Van Diemen's Land," stated, that from the garden of the house in which he resided, 300 gallons of very tolerable wine were made in one year. The chief building is the Orphan School; a large and handsome structure appropriated to the reception of children of both sexes; the boys, in addition to the ordinary branches of school education, being instructed in tailoring, shoe-making, and other useful handicrafts. *New Town* boasts a pottery, tannery, and one or two breweries; it has also its race-course.

LAUNCESTON, is situated in the *County of Cornwall*, and the *Police District of Launceston* (formerly called *Port Dalrymple*), in 41° 24' S. lat., 147° 10' E. long. It stands within the fork formed by the North and South Esk when about to merge in the Tamar, upon a fertile plain backed by rising hills of open woodland, and although con-

sidered very healthy, is subject during the winter to dense fogs.

Its admirable trading position was disregarded for some years after its settlement, owing chiefly to the intricate navigation of the Tamar,* but its advantages at length prevailed, and it began to manifest unmistakeable evidences of commercial importance; at the present time the business-like appearance of the town, its shipping, quays, wharfs, stores, and buildings, both public and private, attest the value attached to it by its enterprising inhabitants as the key of a fertile and extensive country. Its coasting and intercolonial trade received an additional stimulus from the establishment of the colonies of South Australia and Port Phillip on the opposite shores, a forcible indication of the impolicy as well as positive unfairness of endeavouring to promote the welfare of one settlement by preventing the formation, or what is far worse, hindering the progress of others, when under a right system the individual increase and prosperity of each ought naturally to conduce to the welfare of the whole.

The streets (of which Charles-street, Wellington-street, and John-street, are the chief) are wide, airy, and laid out like those of most other Tasmanian towns and villages, at right angles; excellent houses, well-built and well-appointed throughout, extensive warehouses, and handsome shops are numerous, but the public buildings, though good and substantial, already seem disproportionate to the increasing magnitude of the northern capital.

Launceston is chiefly constructed of brick, and consequently lacks the imposing effect produced by the numerous stone edifices of Hobart Town, with which it is in many respects a worthy competitor, having its places of worship—episcopalian, presbyterian, Wesleyan, and meeting-houses of various denominations; its court-house, soldiers' and prisoners' barracks, female factory, &c., its schools both public and private, several banks, various charitable societies (to be mentioned elsewhere), printing establishments, and to crown the whole a well-conducted exchange or reading-room, supplied with an excellent selection of papers from

* Z. P. Pocock, in a pamphlet on emigration, published in 1847, says—"The Tamar is navigable to Launceston, only for vessels of 300 tons, those of larger size being prevented from approaching the wharf by a bar, are obliged to discharge in lighters. The rise of tide is about fifteen feet." Mr. Russell,

who visited Van Diemen's Island in 1839, speaks of vessels of 500 tons burthen being brought into Launceston harbour without difficulty. See Chambers' valuable miscellany, entitled *Information for the People*, vol. I., p. 307.

the mother country and the other colonies. In connexion with the post-office, custom-house, and commercial establishments, a telegraph has been erected on an eminence, called the Windmill-hill, which by means of a code of signals devised for each mercantile house, apprizes the merchants when a vessel enters or clears the heads of George Town.

The hotels and inns are of a superior kind, and the stores well deserve that name, from the quantity and variety of the articles they comprise, which are disposed of at very reasonable rates.

The annual races take place on a flat piece of ground on the banks of the North Esk; the number, breed, and condition of the horses combine to astonish the visitor, and indeed, throughout the island, horses and cattle of all descriptions thrive remarkably well.

Launceston is under the immediate control of a civil commandant, who resides in what is called the government-house, a building of no pretensions, but situated in the midst of an excellent garden.

The country in the vicinity of the northern, is very superior in soil to that which surrounds the southern capital, and the scenery likewise differs. The predominating features are, on one side huge mountain masses separated by narrow valleys, or gullies as they are here called, rising precipitously from the water's edge; on the other, the mountains, though not less lofty, are more remote, the intermediate space being moulded in undulating and richly-productive ground, thickly scattered over with gentlemen's seats, and cleared of all timber, except a few left for ornament.

To the east of Launceston is the open grassy tract called *Paterson's Plains*, on the South Esk, whose junction with a small stream called St. Paul's; is marked by the village of *Avoca*. *Fingal Township* is situated nearer the source of the South Esk, a short distance below its confluence with the Break-o'-Day; the agricultural farms on both banks of the Esk and its above-named tributaries, possess great advantages in point of soil, which have been largely availed of; improvements of all kinds in buildings, fencing, and working the land, especially in drainage and irrigation, have been energetically carried out, until many of them bear a striking resemblance to some of the best cultivated in England, while others show that time and capital only are wanting to assimilate them; nor

is this state of things confined to the above-named localities, but is applicable to various other parts of the settled tracts. Break-o'-Day plains are a series of lofty hills, between which and the Ben Lomond range on the north, there are open grassy lands watered by mountain rivulets. On the south is the St. Paul's tier, so called from the dome-like appearance of one of the elevations. The St. Paul's plains are a succession of indulations running to the eastward, marked by some of the remarkable natural ridges found in different parts of the country, and called "Dead Men's Graves."

The road, of 124 miles, between Hobart Town and Launceston, is tolerably good, and located throughout; it has a considerable degree of traffic, vehicles of all kinds are to be seen there, including mails and stage-coaches, and private carriages attended by servants in livery; while goods of every description are conveyed in drays drawn by a team of bullocks from two to eight in number, as occasion may require.

George Town, situated in *Dorset County* (in $41^{\circ} 6' 20''$ S. lat., $4^{\circ} 23' 44''$ W. of Sydney), from its excellent harbour and commanding position, about three miles from the mouth of the Tamar, was originally designed for what Launceston has now become, the entrepôt for the northern portion of the island, but this project was frustrated by the inferiority of the land in its vicinity. For a defensive station, it offers great advantages, which have too long been neglected. It is now merely a straggling village, but its mild and salubrious air, render it a favourite resort for sea-bathing. It stands at the foot of a snug cove on the western side of a group of conical hills, and is well supplied with water from springs in its immediate neighbourhood. An excellent road has been made between George Town and Launceston, a distance of about forty miles, through a country rendered interesting by the picturesque reaches of the Tamar. *York Town*, on the opposite bank, was an early settlement, since almost wholly abandoned, from its unfavourable soil. The *George Town District* extends on both banks of the river, towards Launceston, and has tracts of fertile soil on either side; considerably to the east of the town itself there is good soil, and the valley of Piper's river is rich, but limited and somewhat thickly wooded; further on to the eastward, the flat-bottomed, marshy, scrubby valleys of Forrester, Boobiala, and Anson's rivers, are stated by Strzelecki to

offer every inducement to agriculture, though requiring like other parts still in a state of nature, an outlay of capital and labour.

About twelve miles south of Launceston, on the high road to Hobart Town, is the thriving village of *Perth*, pleasantly situated on the lofty bank of the South Esk. Two substantial bridges have been thrown across the river, and the churches, mills, &c. form a picturesque scene. A little to the westward of Perth is *Longford*, or *Latour*, a town of recent formation, situated in the *District* now called by the same name, but formerly known as *Norfolk Plains*; it has

* The following description of "cattle-hunting," from the graphic pen of Mr. David Burn, may interest many of my readers:—"In the early days of the colony, ere the local enactment, called the fencing act, had rendered Van Diemen's Land aught beyond a vast common, the cattle of the different settlers were wont to range in hardly restrained liberty throughout the island. With the exception of such as were brought up by hand, or broken into work, the bulk of the herds were as wild as deer, and scarcely less fleet. It thus became necessary to mount herdsmen, who were termed stock-keepers. The province of such herds was to ride round the animals, and keep them as much together as practicable. In addition to this, it was necessary to collect them at particular seasons, for the purpose of cutting, and marking the increase. At any great gathering, several riders were invariably congregated. By many of these, cattle-hunting was regarded as a sport of the most exciting character—no way inferior to a fox-chase—indeed it was an amusement not unpregnant with danger, requiring a tolerable share of nerve and equestrian skill. The hunters were armed with long heavy whips, not so much for the purpose of flogging the animals, as to terrify them with the tremendous cracking, wherewith the hills and valleys were made to resound. No sooner did the huntsman perceive a knot, or as it was colonially termed, *mob* of cattle, than giving his steed the rein, he dashed at them, awaking the echoes with the thunder of his thong, and urging the affrighted oxen madly before him. At the first off-set a tremendous pace was kept up, although the aim of the pursuer might merely be to keep the beast in view until he could increase the group by further accessions. The wily oxen however, seemed generally perfectly aware of such an intent, which they endeavoured in every way to evade; and when a considerable herd had been collected, it required the utmost vigilance and skill to keep the phalanx compact. Sometimes a sulky bull making a dash from the main body—sometimes an old cow becoming blown and refusing to progress—and not infrequently a rebellious subdivision forcing the ranks, and charging down hill with reckless impetuosity.

"For one man to attempt the control of such a herd is an absurdity; indeed it can hardly be achieved by two—for should two or three detachments thus break away, and the main body be left until the deserters were reclaimed, in all probability ere such a consummation could be effected, the column so left to themselves would have dispersed and become lost to view. The fleetness of wild cattle far exceeds the conception of those who have never beheld them

rapidly acquired importance from the beauty and extreme fertility of the surrounding country.

Westbury Town and District (in *Westmoreland County*), likewise formerly included in the New Norfolk district, form one of the finest cattle tracts in the country;* and the farms situated on the Quamby or Western river are of a superior character.

Port Sorell Town and District comprise the chief located tracts of *Devon County*, and include some land in good cultivation. The eastern portion towards Port Dalrymple is hilly, being crossed by the ridge called in full career. These flying detachments will frequently lead the pursuer, at the imminent hazard of breaking his neck, a race of several miles, tearing up and down the hills, doubling and winding in the most rapid and artful manner, and dashing through the underwood and fallen timber, where the spirited semi-Arab courser was sure to follow. Here the greatest risk is incurred. A horse trained to cattle-hunting will follow every inflection of the chase, doubling and winding as rapidly as the oxen themselves; and therefore to avoid a somerset, the utmost caution is requisite; even a wary eye, a ready hand, and prompt attention being sometimes insufficient to save the rider a heavy fall. The chance, however, of being thus unhorsed, is nothing compared to the danger incurred by encountering the limbs of trees, amid which cattle precipitate themselves when hard pressed. Many a good rider has owed his life, or at least escaped from broken bones more to the sagacity of his steed than to any efforts or ability of his own.

"When the heads of such refractory runaways, as it has been endeavoured to depict, have at length been turned in the wished-for direction, a fresh bound is almost sure to be attempted in a new quarter, to control which requires consummate tact. Having regained the battalion whence the troublesome skirmishers have so annoyingly deployed, it will no longer be found in close column, unless the party may have been strong enough to leave a horseman to keep it in check. No, without awaiting the word of command, they have taken open order, scouring the country far and near. Away once more speeds man and horse—tramp, tramp, like the Bürger's Leonora; hurraing—shouting—storming, and cracking their whips, until the tiresome brutes again fall in. Cattle which have broken from the herd have been often so run down as to become incapable of further flight. In such condition they are somewhat dangerous, standing at bay, and charging horse and rider with the utmost fury. Although, as a sport cattle-hunting may have been exciting, nevertheless the wear and tear of horses, and the flesh run off the oxen themselves, added to the great loss of time (proprietors being many weeks collecting the bulk of their herds), rendered the keeping of such wild animals a profitless speculation, unless carried on to a very great extent. The enclosing and subdividing of estates, together with the numerous improvements in the breed and management, have rendered cattle-hunting nearly an obsolete story; the quiet Devon, Suffolk, Hereford, Fife, Ayrshire, or Durham cow having superseded the half buffalo breed of earlier date."

the Asbestos mountains, from the circumstance of asbestos being found there. The western, towards Port Frederick, is low towards the shore, and has a gentle rise further inland. Having noticed the chief northern settlements, I return to those situated between Launceston and Hobart.

Campbell Town, in *Somerset County*, is situated on the banks of a small tributary of the Macquarie, called Elizabeth river, over which a causeway has been erected. It contains some good buildings, and wears a prosperous appearance. There is much good land in its vicinity, although on the north, between it and *Perth*, a sandy, unproductive tract extends, more heavily timbered than the generality of this part of the country, called *Epping Forest*, beyond which lie *Henrietta Plains*, and other open and fertile tracts. The long ridge, sometimes distinguished as the *Eastern Tier*, of which the most conspicuous summits are the jagged peaks of *Ben Lomond*, stretch to the eastward of Campbell Town, to the westward of which lies the embryo township of Lincoln, laid out at the confluence of the *Isis* with the river *Macquarie*; and to the southward, likewise, in *Somerset County*, are the villages of *Lincoln* and *Ross*, or *Ross Bridge*, as it is frequently called, from the long narrow wooden structure that here crosses the Macquarie. Two miles from Ross about 30,000 acres of land were originally reserved by government as peculiarly available for farming purposes, but they have long since been disposed of to private individuals, and are now under successful cultivation. To the south of Ross lie extensive flats of excellent pasturage, called *Salt Pan Plains*, from two large salt marshes therein situated, the one of about forty, the other some twenty acres in extent. In winter these marshes are filled

with rain, which, after the evaporation caused by the summer heat, have a crust of fine white salt, varying in thickness from a quarter to half-an-inch. These plains are terminated on the south by woody hills, among which is a defile called *St. Peter's Pass*, a few miles beyond which lies *Oatlands*, a thriving but not prettily-situated town, nearly midway between the southern and northern capitals. It adjoins a rushy lagoon, about four miles in extent, called *Lake Frederic*, and has some substantial public buildings, and a considerable number of good freestone dwellings. The land around is well supplied with surface water, and otherwise adapted for agricultural purposes. Limestone is abundant in this neighbourhood. Between Oatlands and a straggling settlement called *Jericho** lies a beautiful level, comprising from ten to twelve hundred acres, originally called *Fourteen Tree Plain*, from a singularly formed group which grew there. *Jericho* is situated on the right bank of the *River Jordan*, which, from its head down to *Brighton*, a distance of about thirty miles, comprises a series of very flourishing farms.

Bothwell Town and District are situated to the westward of Oatlands, on the left bank of the Clyde, which divides the counties of *Monmouth* and *Cumberland*. It has a neat church, military barracks, gaol, mills, good inns, &c., and is built upon a somewhat sandy flat, backed by wooded and mountainous country. In its vicinity are some valuable estates, with handsome residences. *Den Hill*, an eminence of long, tedious, and, for cattle, even dangerous ascent, lies between Bothwell and Hobart Town. The distance between these places, by the line of road, is about forty-six miles. To the south of *Bothwell*, on the same bank

* The origin of the names of places in our colonies will hereafter be a puzzling subject for the antiquarian; and certainly the designations of various localities in Van Diemen's Island, unless explained, will give rise to innumerable conjectures. The strange juxta-position of such words as *Jericho* and *Bagdad*, *Jerusalem* and *Abyssinia*, *Jordan* and *Nile*, *St. Paul's river* and *Hell's gates*, *Tiberias* and *Troy*, is thus explained:—At the period of the early settlement of the colony, in 1804–5–6, the colonists and convicts were much in want of animal food, and several persons—soldiers, freemen, and convicts, were allowed to range the bush in quest of game, a mode of life which subsequently led to the crime of "bush-ranging." Among the parties so employed there was one under the direction of a marine, named Hugh Germaine, who, with two convicts, collected kangaroos, emus, &c., for a marine officer, to whom Germaine was servant. Game was then very plen-

tiful; and on the spot where Hobart Town barracks now stand, Germaine killed a large forest kangaroo, who measured nine feet from the tip of the nose to that of the hind feet, and whose hind quarters weighed 130 lbs. Germaine and his assistants pursued this life for several years, and returned to his master, on an average, 1,000 lbs. of animal food weekly, which was sold to government for 1s. 6d. per lb. For five years Germaine never once slept in a bed, and lived entirely in the bush with his companions. Only one of the party could read; and the sole books in their possession were a Bible and the *Arabian Nights' Entertainments*. Whenever, therefore, the hunters were in want of a name to distinguish a place—having previously exhausted the vocabulary of Kangaroo Point, Emu Plains, &c.—they chose their names out of the book of sacred writ, and from among the most celebrated scenes described by the Arabian story-teller.

of the Clyde, is the pretty town of *Hamilton*, situated in the *District of Hamilton*. It has a handsome stone church, good flour mill, police court, &c. The road from Jericho to Hobart lies through an old-established little hamlet called *Lovely Banks*, and thence through a rich flat about six miles in extent, called the *Cross Marsh*, intersected by the Jordan, to the fertile valley of Bagdad, (enclosed throughout with post and rail fences), which, though at first of limited breadth, expands as it approximates to the Derwent into noble plains, equally desirable for the farmer or the grazier. It is bounded on either hand by moderate hills, whose slopes afford excellent pasturage. Some few miles' distance, to the right, lies the settlement called *Tea Tree Bush*, and on the left of the townwards road is the township of *Brighton*, which stands in the midst of very extensive but somewhat stony plains, immediately below the junction of *Strathallan Creek* with the *Jordan*, and above their embouchure, in a beautiful cove of the Derwent, which soon after, taking first a south-west and then a north-west direction, separates the counties of Monmouth and Buckingham. On the northern frontier of the latter county, and on the southern bank of the river, stands *New Norfolk* or *Elizabeth Town*, distant twenty-two miles from Hobart Town, built upon an eminence called *Richmond Hill*, which slopes gently towards the Derwent. It is the centre of a small but very productive district. Its public buildings present nothing remarkable, except the hospital, whose external construction and internal arrangements are both admirable. The town is well watered by means of an aqueduct cut from a rivulet named the *Thames*.* A pretty little hamlet, exactly facing New Norfolk, on the opposite shore, borders a streamlet called *Back River*, and lies in a sort of natural basin surrounded by rising ground, a conspicuous eminence, named from its form *Mount Dromedary*, towering above the rest.

Richmond, in *Monmouth County*, is a village of some consideration, having, besides the usual buildings in an incipient town, an excellent stone bridge, and a windmill with a stone tower, and good inns. It is situated at the head of Pitt Water, a salt-water

lagoon communicating with North Bay, about six miles in length and three in breadth, around which there is a considerable portion of comparatively level land of the first description, adapted for either agricultural or pastoral purposes. The small settlement called *Jerusalem* lies near the sources of Coal river, which disembogues at Richmond into the Pitt Water lagoon, on whose north-eastern shore stands *Sorell Town* (Pembroke county), a thriving place, with a church and parsonage-house, school-house, windmill, and several good inns. The land in the vicinity is considered among the best in the colony, some is even said to have produced sixteen crops of wheat in succession, many of them self-sown. The view from behind the town is very English-like; undulating cultivated ground, divided into fields by post and rail-fences, and ornamented by the scattered dwellings of settlers, stretches in various directions among the woody hills. To the south of *Sorell* is *Carlton*, a pretty little hamlet situated on a creek opening into North Bay.

The centre of *Pembroke County* is occupied by *Brushy Plains*, an extensive flat of open forest, bearing grass and sedgy herbage, intermingled with scrub, and joining some swampy land called the *White Marsh*. From thence, over a series of open forest hills, there is a road to *Prosser's Plains*, a grassy district partially located. The adjacent rugged woody ravine of Prosser's river is ironically called *Paradise*, and on the route to *Prosser's Bay* some very rough steep hills are termed the *Devil's Royals*. From the latter-named bay the track leads through a few open forest grassy hills to the agricultural settlement at Spring Bay. The road from Prosser's Plains to *Kelvedon* passes beside a soft salt marsh, at the head of the *Little Swan Port*, and over a series of basaltic bluffs, divided by deep ravines called the *Rocky Hills*, which separate the districts of Little and Great Swan Port. The forest is distinguished from most others in the island by the prevalence of a cypress-like tree, called the oyster bay pine (*callitris pyramidalis*.)

The chief locations in the *County of Glamorgan* are comprehended in the *Great*

* A curious circumstance, noticed by Prinsep as recorded in the early annals of New Norfolk, is, that a whale once found its way thus far up the Derwent, and being unable to turn, was easily made a prize of by the astonished inhabitants. A gentleman in the neighbourhood gave a considerable sum

for it, and hastened to Hobart Town, expecting to profit by his speculation; but, on his return, he found the monster of the deep already disposed of, having been devoured, during his absence, by the small fish.—*Journal of a Voyage from Calcutta to Van Diemen's Island*, p. 77.

Swan Port District, a large but thinly-populated tract, extending along the shores of *Oyster Bay*, and backed by a continuous ridge of high land (see "Coast Line.") It includes some fine pastures, and a fair proportion of agricultural soil; but the peculiar feature of this locality is the whale fishery.

In the *County of Kent* there are as yet few traces of cultivation, except in the immediate vicinity of *South Port*, although the fertile banks of the *Huon* and its tributaries will, doubtless, be speedily located whenever Tasmania shall obtain the elements of prosperity, in which alone she is now deficient, namely, capital and free labour.

Two inland townships still remain to be noticed, namely, *Morven* and *Horton*; both of them have been formed since those to which I have previously alluded, and are now the centre of rising districts, especially the former, whose population, importance, &c., as will be seen in the statistical section, has increased extraordinarily during the last few years, already surpassing many places of far older establishment. The townships, however, one and all, are, as it were, the creation of yesterday; and to attempt in this place a detailed description of them would be but to waste space, since in a few years the likeness might probably scarcely be recognised, more especially as the limits of the existing divisions are liable to continual alteration.

The territories occupied by the Van Diemen's Land Agricultural Company lie in the north-western portion of the island, and include the following tracts:—

The Peninsula of *Circular Head*, whose seaward face has been described in the "Coast Line," is $5\frac{1}{2}$ miles long, and contains about 8,000 acres, of which some 4,000 acres consist, for the most part, of dry open grassy hills, with an excellent herbage of fine grass, trefoil, cinquefoil, and wild vetches. The soil is light, but productive. About 2,000 acres are covered with small trees, and many parts, though rocky, comprise patches of good grass. Water is difficult of attainment.

At *Highfield Plain*, on the north-west part of the peninsula, 36 acres of forest have been cut down, and the land brought into cultivation, the well-tilled fields wearing a cheerful aspect. The village contains farm buildings, stores, workshops, a jetty, and several residences, of which the principal is the handsome dwelling, with its fine garden and demesne, of the Company's agent (see view on map), occupying some rising ground

on the northern part of the point. Substantial barracks for the convicts in the employ of the Company have been erected at this station, also well-constructed stone stables for the valuable horses reared at *Circular Head*.

At *East Bay* much labour has been effectually bestowed upon large sluices of marsh rescued from the influx of the sea.

The country adjacent to the peninsula consists principally of barren heathy plains and low swampy forests, and the part near the shore is cut up with the branches of a large estuary.

The vicinity of *Woolnorth* is basaltic, and to the westward low and marshy, but the land generally is of fair quality, and some of the soil is red loam. *Highbury*, the township of the district, comprises cottages, stores, farm-buildings, &c., belonging to the Company. The low ground near the coast is open grassy forest; short bushes cover some parts of the interior, and the sandy and grassy hills south of *Woolnorth* have good sheep pastures.

Between *Circular Head* and *Emu Bay*, the country is intersected by many rivers, and the road lies close along the coast; proceeding from a muddy bay near the peninsula, for eight miles on a sandy beach, *Black River* is reached; here blue slate of good quality, and limestone, are found; thence, five miles of beach lead to *Crayfish River*, and four more to *Detention River* (see map), where there is a grassy plain at the foot of some steep white quartz hills near *Rocky Cape*; which are thinly covered with sandy peat, and have scattered over them a species of *Xanthorrhæa* or grass tree, and a beautiful *Blandfordia*, with stems one foot and-a-half high, supporting crests of ten to twenty pendulous red blossoms, margined with yellow, one inch and-a-half long, and three-quarters of an inch wide at the mouth. East of these hills is a level plain, on which the *Banksia serratifolia* is the prevailing tree; it is equal in size to a pear-tree, its heads of flowers are six inches long and twelve round; the seeds as large as almonds. Near *Table Cape* there is some rich red loamy soil, clothed with luxuriant vegetation; fern, prickly acacia, and musky aster, grow so thickly as to render a passage difficult. The tree ferns are particularly numerous, and many lofty shrubs are overrun with the white clematis and different climbing vines, alike over-topped by stately stringy barks and white gum trees about

200 feet high. The road thence passes along the beach, crossing the *Inghis* and *Cam* rivers to *Emu Bay*, near which the Van Diemen's Land Company have a store; the goods are landed on the basaltic rocks which there rise perpendicularly out of the sea in pentagonal columns.

Between *Emu Bay* and the *Hampshire Hills* (distant twenty miles), lies a magnificent forest; for a few miles from the sea it consists chiefly of white gum and stringy-bark trees 200 feet high, with straight trunks clear of branches for from 100 to 150 feet, and resembling, in the opinion of James Backhouse, who traversed this region, "an assemblage of elegant columns so irregularly placed as to intercept the view at the distance of a few hundred yards." These giants of the forest are crowned with branching tops of light willow-like foliage, but at an elevation too great to allow the form of the leaves to be distinguished, yet casting a gentle shade on the fern-trees and shrubs below, as well as on the smaller ferns which carpet the ground.

As the distance from the sea increases, the Australian myrtle and sassafras, with their dark dense foliage, become the prevailing trees, while the undergrowth is composed of the tree-fern, some of which have trunks twenty feet high, and leaves eight to twelve feet long, which with the new ones forming, rise in the centre like croziers. The road is ascending and undulating, broken at intervals by grassy elevated plains and vales, varying in extent from 300 to 1,500 acres, intersected in every direction by clear streams with pebbly beds.

St. Valentine's Peak, although only six miles from the Hampshire, requires a distance of sixteen miles to be traversed before its summit is reached, owing to the thickness of the myrtle forest, which extends part of the way up one side. From the top of the Peak (see map) the north coast is visible near Port Sorell, the Cradle mountain, Barn Bluff, and the lower parts of the western tier bound the prospect on the east. Numerous mountains are visible to the south, and on the west the sea is seen through a few openings in the hills. The whole view, except the sea, the projecting rocks, and a few small open tracts of land, such as the Hampshire hills, Goderich plains, &c., appears to extend over one vast sombre forest.

The Van Diemen's Land Agricultural Company have a settlement in the Hamp-

shire hills, upon a gently rising eminence, among grassy and ferny slopes, interspersed with forest, and watered by clear brooks, bordered by beautiful shrubs.

An opening in the forest called *St. Mary's Plain* is described by J. Backhouse as being clear of wood, except a few clumps of silver wattle on the hills, and lines of tea tree on the margins of the brooks by which it is intersected; one of these falling over a basaltic rock, forms a pretty waterfall, about forty feet high and thirty feet wide; it is decorated with the tea tree at the top and sides, and at the bottom a shrubby *aster* with toothed leaves, is loaded so profusely with pure white blossoms as to bend gracefully in all directions. The grassy hills are besprinkled with buttercups, blue speedwell, flax, stylidium, and little white flowers resembling English daisies. The road to this "spot of great beauty" is through a myrtle and stringy-bark forest, by which it is encircled.

The *Surrey Hills*, about twenty miles to the south of the Hampshire hills, have an elevation of nearly 2,000 feet, and are equally beautiful; they resemble in some places English enclosures, being separated by brooks, bordered by belts of sloping shrubberies; in others the knolls resemble a neglected old park.

Mr. Fossey, who traversed the Surrey hills, likewise represents the neighbouring country as resembling in appearance a nobleman's domain, both as to extent and quality, particularly that part lying east of the river Leven. The *Green Forest*, which divides the Surrey from the Hampshire hills, comprises myrtle, sassafras, "celery-top" pine, with a little stringy bark, all of large circumference. There are also the "pepper" and fern trees, with musk and dogwood. The whole distance from the Hampshire hills to the coast is like the Green forest, except two small plots of land. A considerable portion of the forest is very flat and dry, rich in soil as nature can make it, and tolerably open, to within about three miles of the coast.

The climate of the Hampshire and of the Surrey hills is as humid as that of Yorkshire; indeed, on the former, which are nearest to the sea, the quantity of rain which fell, from 1835 to 1839, averaged annually 67 inches; in 1838 it exceeded 80 inches. Snow falls in winter to the depth of a foot, or more; fogs are unknown, and the air is salubrious. Limestone and building-stone

are attainable, and offer inducements to settlers, but, on the other hand, the difficulty of removing the timber is a serious obstacle.

The measurement of trees growing in two acres of the Emu bay forest is thus stated by the late Mr. Hellyer:—

	First Acre.	Second Acre.
Trees under 12 inches in girth	500	704
Trees from 1 to 2 feet in girth	992	880
" 2 to 3 " 	716	148
" 3 to 6 " 	56	56
" 6 to 12 " 	20	32
" 12 to 21 " 	12	28
" 21 to 30 " 	4	8
Trees 30 feet and upwards	4	8
Fern trees	84	112
Total	2,384	1,976

Vegetation of every description seems to thrive in these districts. The tea tree (*Leptospermum lanigerum*), usually a shrub of about 10 feet in height, was found at Chilton, near the foot of Valentine's Peak, 70 feet high and 7 feet in circumference. The silver wattle, in the same locality, grew 70 feet high and 11 feet two inches round; while a sassafras tree measured 6 feet round and 140 high. At the junction of the *Emu River* with the *Loudwater* (so called from its cascade), within a distance of half-a-mile, ten standing trees were measured, whose height was 180 to 200 feet, and their circumference 18 to 20 feet. One tree which had fallen, was ascended and walked along by four persons abreast with ease. The elevation, traceable by the branches, was 213 feet. In his fall he had overturned another 168 feet high. Some of these trees, when felled, are so large that they cannot be cut into lengths for splitting. Near the *Guide River* two myrtles were measured, of 32 and 42 feet round, and, with many others, appeared to be about 150 feet high. Some of the tree ferns have 32 old and 26 new fronds; the usual number is 6 old and 4 new, exclusive of the dead ones. The description given by Backhouse, of some of these forest trees is very graphic. In one place, at a few miles from Emu bay, he measured a tree supposed to be 250 feet high, which had a girth of 55½ feet at 5 feet from the ground; its circumference at the surface was about 70 feet. He adds: "My companions spoke to each other when at the opposite side of the tree to myself, and their voices sounded so distant that I concluded they had inadvertently left me to see some other object, and immediately called to

them; they, in answer, remarked the distant sound of my voice, and inquired if I were behind the tree!"

When the road was forming through this forest, a man who had only about 200 yards to go from one company of the work-people to another, lost himself; he called, and was repeatedly answered, but getting further astray, his voice became more indistinct till it ceased to be heard, and he perished. Some of the white gum trees are of such equal circumference, that in a fallen trunk of 100 feet in length, it was difficult to determine which end had grown uppermost.

The Van Diemen's Land Agricultural Company's station at *Chilton*, distant 113 miles from Launceston, is about 2,106 feet above the sea, and consists of high marshy flats. Proceeding thence towards Launceston the *Leven River* is crossed, the road beyond lies through some open forest, over the swampy Black Bluff mountains (3,381 feet high), and across a fine open country called the *Vale of Belvoir*, in which there is a sheet of water named *Patterdale Lake*. The Belvoir vale has numerous pits of water and streams even with the grass, dividing and again uniting. There are also deep fissures in the earth destitute of water. Passing the *Middlesex Plains* the *Isis River* is crossed, and the *Great Western Road*, as it is termed, leads through an open forest. On the descent to the *Forth River*, which is about 2,000 feet, there are some beautiful views of mountain scenery. The river is here wide and rapid, and the noise of the fall called the *Forth's Gateway*, is audible at a considerable distance.

Gad's Hill, which lies between the *Forth* and the *Mersey*, is 2,588 feet high, very steep, and clothed with timber. On the top of the hill are some pretty grassy plains. After passing the *Mersey* river there are a few hills, and some small limestone plains, called the *Circular Pond Marshes*, which derive their name from a number of circular basins that seem to have been formed by the draining off of the waters through subterranean channels. Some of these pits are full of water, the outlets below being choked with mud; others are empty and grassy down to their perforated bottoms. There are also here, as in other parts of the island, some remarkable caverns, with openings like doorways, and long subterranean passages, opening into grassy hollows.

Between the *Circular Ponds* and the *Mole River* (so called from its occasionally flow-

ing underground), there is some elevated land.

Newly-discovered Country.—We are as yet imperfectly acquainted with the character of the territory recently explored in the western part of the island, and around Port Macquarie and Port Davey; it appears to be somewhat similar to the scenery and grassy elevations of the Hampshire and Surrey hills, only the plains are larger, and the mountains loftier than those in the northern districts. The area of some of these tracts is thus estimated:—*King William's Plains* 40,000 acres, *Guelph Plains* 20,000 acres, *Vale of Gordon* 120,000 acres, *Pedder and Huon Plains* 12,000, forest openings 8,000 acres; total 280,000 acres. The rough herbage has been burnt on these plains to promote the growth of the grasses which succeed it, and in some parts, especially near lakes Pedder and Edgar, the pasture is luxuriant.

The plains to the westward of the Arthur range, those near Port Davey, Bathurst plains, Painter's plains, and those on the Franklin, near the foot of the Frenchman's Cap, beside the valleys of the Denison and the Picton rivers, have as yet only been seen by Mr. Cotton, the assistant surveyor-general, from the mountain peaks: he was of course unable to estimate satisfactorily their extent, but he considers an area of 100 miles in length by 40 in breadth, or one million acres of land are fit for the immediate occupation of flocks, and that the tract contains a full proportion of fertile country fit for agricultural purposes, and *never-failing rivers*. Its geological structure is said to bespeak the existence of metals, and the banks of the Gordon, from their abrupt bend to the salt-water level, are peculiarly deserving of attention.

These fine tracts of open country have hitherto been an unknown land, owing to the almost impenetrable natural barriers with which they have been surrounded. Surveying and working parties are now employed under the direction of the surveyor-general of the colony, Captain Power: the base of operations being on the upper part of the Derwent, and on the lower part of the Huon. A cart-road has been opened from Marlborough to the north part of King William's plains, a distance of twenty-four miles. A branch road from the above passes between Mount Charles and the Wentworth hills, ten miles to the Derwent, and a foot-tract has been marked out from

the Guelph river to the head of the Gordon. A bridle-road has been opened from Victoria, on the Huon river, through a very intricate forest country, bordering that river to lakes Pedder and Edgar, a distance of fifty miles, over many small streams and the *Arve*, the *Picton*, and *Cracroft*, which are of more importance (see map).

Unexplored Country.—The territory lying between Woolnorth and Macquarie Harbour, a tract about 100 miles long, by 30 to 50 miles broad, is almost entirely unknown. Judging from the nature of the country about the *Surrey Hills* in the north, and the *Frenchman's Cap Mountain* in the south, there will probably be found large available districts, and as the settlers are now locating their flocks along the rich valleys of the Gordon and Huon rivers, they will soon be led to seek fresh herbage in the more northern parts of the island. Pastoral pursuits are the ordinary precursors of agriculture, and it is the advantages it offers for both, but especially the latter branch of rural industry, that renders Tasmania such an eligible position for men with small capital, who desire to obtain a subsistence from the soil.

Farming is better understood, and more carefully practised in Van Diemen's Island than in New South Wales; the extensive sheep downs and cattle runs in Australia invite the settler to grazing pursuits, but the absence of these extensive prairies, and the rich alluvial valleys of the Tamar, Derwent, and other rivers in Van Diemen's Island, almost compel the Tasmanians to devote their energies to the tillage of the earth. Hence the appearance of elegant mansions and pleasure-grounds; tasteful cottages surrounded by gardens, well-stocked farm-yards, and extensive barns; comfortable homesteads and productive orchards; admirably tilled fields, divided by neatly-clipped hedgerows; while the agricultural villages, with their church, school, and parsonage, the well-supplied inns, and excellent stage coaches surprise every traveller on visiting Tasmania. Sir William Denison, in a recent dispatch to Earl Grey, says—

"Comparing the aspect of the colony with colonies of far older date, settled under different circumstances, we are at once struck with the appearance of wealth and prosperity which is everywhere manifested. The houses in the towns are well built of stone or brick; the streets are well kept; the roads are remarkably good; the wharfs and public buildings show evidence of a large outlay of labour. In fact, there is a general aspect of ease and affluence throughout the length and breadth of the land."

CHAPTER III.

GEOLOGY—MINERALOGY—SOIL—CLIMATE—AND DISEASES.

THE general geological features of Van Diemen's Island are similar to those of Australia; but the effects of subterranean agency, as evinced in the torn, rugged, and contorted surface of the colony, are more manifest in the lesser and southern island. Count Strzelecki found, during his scientific researches, that in Van Diemen's Island the space occupied by the *crystalline* as compared with the *sedimentary* rocks, was 7 : 1 ; in New South Wales, 3 : 1. A classification of all the mineral masses, whether unstratified or stratified, into two divisions—the one including rocks having more than 60 per cent. of silica, the other less than 60 per cent.—shews that in Van Diemen's Island the area of the first division is to that of the second as 1 : 3 ; in New South Wales, as 4 : 1 : 1.*

The various geological details given in the previous divisions, on New South Wales, Victoria, South Australia, and Western Australia, although applicable, do not require recapitulation; but it may be advisable to mention some of the leading characteristics of Van Diemen's Island, which Strzelecki supposes to have been originally composed of five islands: the *first* approaching the form of a triangle, and included between Cape Portland, St. Patrick's Head, and the head of the river Forrester; the *second* constituting what are now called the Asbestos hills; the *third*, a small island, now forming the valley of the Lake river: the *fourth* including the eastern portion of the Hampshire hills and a part of the northern shores; and the *fifth*, an oblong and indented island, comprising a part of Middlesex Plains, and enclosed between Macquarie Harbour, Port Davey, South-west Cape, South Cape, the right bank of Huon river, the west side of Lake St. Clair, and Western Bluff.

The localities where different rocks are found, are stated by Strzelecki to be:—*granite*—Eldon range, Ben Lomond, and Frenchman's Cap; *glandular granite*—Flinders' island, Cape Portland, and Black ridge; *porphyritic granite*—Eldon and Black ranges, and Ben Nevis; *protogene*—Eldon range; *sienite*—islands in Bass Straits, eastern coast of Van Diemen's Island, on Mounts

Horror and Humboldt, and at Port Davey; *quartz*—the most remarkable locality is in the dividing range west of Lake St. Clair, Frenchman's Cap, and the spur which unites that mountain to the main ridge of the dividing range; the granular variety is principally found between the Mcander and the Mersey rivers, at Rocky Cape, Cape Grim, and the heads of the Derwent; *curite*—on the summit of Flinders' island; in Van Diemen's Island it appears first between Mount Cameron and Waterhouse Point, and is next met on the Black range; it is also found on the St. George and Scamander rivers, to the north of St. Patrick and Ben Nevis, and to the south of St. Valentine's Peak, in the Hampshire hills; *serpentine* is seen in a mountainous mass on the Asbestos hills; on their west side it is associated with mica-schist, on the east with limestone, on the north with greenstone; the maximum height at which it is found is 1,500 feet; the structure decidedly amorphous, but in the vicinity of the river Rubicon it shews some slight appearance of stratification. The foregoing constitute the *crystalline* rocks, which form by far the largest portion of the island; the distinguishing lithological peculiarities of each are stated in the previous division on New South Wales, pp. 500, 501.

As regards the *sedimentary* rocks, it may be briefly noted that *mica-schist* is found in various places, associated with granite, sienite, and serpentine; siliceous and argillaceous slate exist in many localities; limestone, compact and fossiliferous, is widely spread; much of the common limestone is of a yellowish or reddish colour, owing doubtless to the quantity of oxide of iron with which it is mixed; slaty greenstone is obtainable in every part of the island, at various heights, to an elevation of 5,200 feet above the sea and shore, capping some of the most prominent elevations of the interior.

For the benefit of those who understand little of the scientific nomenclatures of geology, and the relative position of different strata, but who wish to know what are the useful rocks, I may state that argil appears in the form of excellent roof-slate, at a cer-

* Strzelecki, p. 155.

tain spot between Launceston and George town. In the form of mica, it is found in large masses on the rocks round Port Davey, on the southern corner of the island, where, being much exposed to the winds and waves of the Southern Ocean, they have become so much worn by the weather, as to put on the appearance of snow. Excellent sandstone for building is obtained in almost every part of the island, and many of the houses in Hobart Town are now built with it, instead of badly made bricks, as formerly; it is brought from different parts within half-a-mile or a mile of the town. A quarry of this kind has recently been discovered at Port Arthur, where the manufacture of filtering-stones, it is probable, will be found a profitable employment. Flints are scattered in great plenty upon the hills, especially in neighbourhoods where basalt abounds. They generally occur in the globular form, covered with a white indurated crust of chalk. Other rarer species of the siliceous genus have been found in different parts of the island, especially in those which appear to have been washed, in former times, by the ocean, and which have been deposited in certain ranges or linear positions by the lashing of the waves, and the subsiding of the waters. Of these may be mentioned, though found generally in small pieces, hornstone, schistus, wood-opal, blood-stone, jasper, and that singular species called the cat's eye, reflecting different rays of light, according to its position. Marble, well adapted for domestic purposes, is obtainable in several places.

Basalt is very abundant; indeed, it would appear to be the predominant substratum of the island. All along the coast, it presents itself in rocky precipitous heights, standing on beautiful columnar pedestals, as at Fluted cape, Adventure bay. Circular Head is a remarkable instance of the singular appearance which this species of rock puts on, resembling different artificial productions of man: it stands out into the sea, exactly like a huge round tower or fortress, built by human hands. At Cape Grim, some of the upper portions of the cliff are soft sandstone, but the most striking portions are of columnar basalt. Mount Wellington, the great western Table Mountain, and the rocky banks of many of the mountain rivers, as the Shannon, are composed of this rock. In some parts, both on the coast and in the interior, the columns stand up in insulated positions, springing up from the grass or the

ocean like obelisks or huge needles, and presenting a singular appearance to the eye. On the south end of Bruny island, which is composed of this rock, there are several of this description; and those upon the land stand erect upon their several blocks, gradually diminishing as they rise, till the force of a well-aimed stone would be sufficient to drive the uppermost from its seat. As this rock has the power of acting on the magnetic needle, and since it occurs in such large masses in the island, it may account, in some measure, for the variations which travellers in the bush sometimes experience, who depend on the guidance of the pocket compass. Elevated beaches are found in several places; that which forms Green island, in Bass strait, is a comminuted mass of shells, and rises to the height of 100 feet. Similar up-heavings are found on the west and south coasts of Tasmania.

Petrified remains of wood, and other vegetable productions, entirely converted into siliceous matter, and capable of the finest polish, are occasionally met with in different parts of the island, especially in the Macquarie district, at Allenvale, and Mr. Barker's estate, where whole trunks and branches of trees have been found, some in a horizontal, and others in a vertical position, exhibiting the fibres and structure of the leaves and wood, the distribution of the vessels, and the annular growth, as distinctly, and in as perfect a state as in the living tree.

MINERALS.—Iron ore, of a red, a brown, and a black colour, is very frequently met with; some analyses gave eighty per cent. of the pure mineral. It occurs, though rarely, and in smaller quantities, under the form of red chalk, which, when mixed with grease, is used by the aborigines to adorn themselves with fantastic figures. Of other metallic ores, specimens of red and green copper, lead, zinc, manganese (and, according to some persons, silver and gold), have occasionally been met with. There are no metallic mines as yet worked; but, judging from the geological characteristics, and the formation and locality of Van Diemen's Island, I have no doubt it is rich in mineral productions.

Coal has been found cropping out in various places right across the island:—beginning at South cape, it is found at Satellite island, in D'Entrecasteaux's channel, on the banks of the Huon river, at Hobart Town, at New Norfolk, the Coal river, Jerusalem, Jericho, and other places. The stratum of

the South cape is situated on the north side of the bay, and extends about two miles along the coast. A few miles above New Norfolk, at Mr. Cawthorn's farm, on the Derwent, a fine bed of what is termed wood-coal has been discovered, at a depth of about thirty feet. Mr. James Rennie, on examination, ascertained that the layers and fibres of the wood are very marked and distinct, even to the worming and irregular lines caused by knots; yet when the pieces are broken transversely, they exhibit the fracture of genuine coal. At the upper bend of the semicircle of the Derwent, the bitumenization has advanced farther; jet, of the finest grain and lustre, has been found passing from the common wood-coal, with an even or vitreous fracture, into a phase, presenting a perfect conchoidal fracture, in which it might be cut into necklaces, brooches, and other ornaments. The Derwent wood-coal burns with a strong, unpleasant smell, but is admirably adapted for the preparation of gas. In the coal found at Port Arthur, the greater portion of the bitumen is driven off by volcanic heat, while the sulphurous portion, in rising through the superincumbent strata of sandstone, &c., combines with the iron, forming the whitish metallic layers of pyrites, often mistaken for copper or silver. The Port Arthur coal-mines have been worked for some years by the colonial government with convicts; they are now let on lease to a private individual. A shaft has been sunk to a depth of more than 300 feet; and the galleries where the miners work are said to extend over a space of several miles.

Between the sources of the *Macquarie River*, which run to the *Tamar*, and those of the *Jordan River*, which run to the Derwent, there is a salt plain, with three pools or hollows, which are filled with water during the rainy season; but when dried up by evaporation, the soil around them is so strongly impregnated with salt, that a considerable quantity of this indispensable condiment is left on the surface, and collected by the settlers for domestic use. There are several medicinal springs; some fifteen miles west of Circular Head, belong to a class of carbonated waters, and are aperient and tonic.

THE SOIL is very varied; in some places a rich alluvial mould, in others sandy or argillaceous; its fertility is shewn by the excellent crops produced for successive years without manuring the land. A soft clayey

marl has been discovered around Hobart Town during the progress of improvements, exposed at a depth of two or three yards, and has proved very useful as a manure.

CLIMATE. — Allowing for the higher southern latitude, the coldness and humidity attending on its insularity, and direct exposure to the strong winds of the Southern Pacific, the seasons and weather at Van Diemen's Island may be estimated from the data given in the preceding volume respecting Australia.

Generally speaking, throughout the summer months, there are alternate land and sea breezes, every twenty-four hours, the influence of the latter being felt many miles from the shore, and tending greatly to cool the atmosphere, even in the hottest days of summer. The wind blows from the land, from sunset till ten or eleven o'clock the following day; when the sea breeze sets in and continues till evening. The average of the thermometer is about 70°; although there are times when the mercury is subject to sudden elevations, even to 100° to 110°. When this happens, a hot wind blows from the north or north-west, the effects of which sometimes show themselves upon growing crops, by producing blight, and similar injurious consequences; but it seldom lasts long; and the rain, which is almost certain to follow within a few hours, again so cools the atmosphere, that its previous sultriness is little regarded. Thunder storms are seldom experienced; nor are they ever of a violent nature. Even in the height of summer the evenings and nights are generally cool.

September, October, and November are the spring months, when the weather is usually bright and clear, with occasional rain and high winds. The average of the thermometer for these months is from fifty to sixty degrees.

December, January, and February constitute the summer. In general very little rain falls during these three months. The productions of the earth, such as grass, corn, and vegetables, arrive at maturity about *one month* earlier than the same kinds would in England; that is, in December, which answers to the June of the northern hemisphere, products are gathered which, in England, ripen in July.

March, April, and May are the autumnal months, and form by far the pleasantest season. The air is then clear and bright—the sky free from clouds and vapours—the

medium heat of the day is about 65°; and the nights are cool and refreshing.

The winter includes June, July, and August: in the interior, particularly upon high and exposed situations, frosts are sometimes severe, and at times a good deal of snow falls; but it is seldom that the sun so wholly loses its power, as to suffer an appearance of either frost or snow to last throughout the day; and the winter is rather contemplated by the inhabitants, as a season of moderate and genial rain, sufficient to replenish the storehouses of the earth against the ensuing spring, and to facilitate the labours of the husbandman, than as the cold and dismal period of the higher latitudes. The longest day is fifteen hours twelve minutes; the shortest, eight hours forty-eight minutes.

There is a royal observatory at Hobart Town, 42° 52' S., 9^h 50^m E. It is under the directorship of Lieutenant J. H. Kay, R.N., and the observations are registered day and night with great care; from January, to the 1st of October, 1848, they were made hourly, and thence to the 31st

of December, at five periods in the twenty-four hours, viz., at two and six a.m., and at two, six, and ten p.m. The cistern of the standard barometer is 107 feet above the level of the mean tide, causing a depression in the mercurial column of about 0.1. The observatory is unfavourably situated for a correct register of the *absolute* quantity of rain which falls in any year; *relatively* one year with another there is no doubt of the accuracy of the register, as the reservoir which receives the rain is emptied every morning at nine o'clock, and by a self-acting syphon besides, whenever the quantity which falls exceeds the twenty-fifth part of an inch. The effect of evaporation is therefore inappreciable, as the pencil of the register marks the quantity as it falls. The area of the funnel which collects the rain is 200 square inches, and as the reservoir contains fifty cubic inches, each time it is full, 0.25 of an inch of rain has fallen on that area. With these explanatory remarks I give the following meteorological table for Hobart Town during the year 1848:—

Months.	Barometer.		Fahrenheit's Thermometer.		Mean.		Quantity of Rain, in inches.	Usual No. of Wet Days.	Mean Temp. of the Air for 3 years.
	Max.	Min.	Max.	Min.	Barom.	Therm.			
January . . .	30.166	28.952	82.7	43.0	29.737	60.2	1.03	10	61.2
February . . .	30.276	29.477	81.0	42.7	29.950	59.3	0.80	7	59.7

November . . .	29.938	28.938	74.7	40.0	29.442	53.3	3.83	11	55.6
December . . .	30.110	28.869	86.6	39.8	29.550	56.7	2.22	10	60.8

The mean for the year 1848 was—barometer, 29.739; thermometer, 52.3; rain 23.67 inches. The average number of rainy days is in a dry year 100, and in a wet year 120 days. The hot winds during 1848 were rare and of moderate character, occurring on January 3rd, February 12th, March 30th, and April 5th; that on February 12th was most marked, the thermometer being 91° in the shade. None occurred in the latter part of the year. There was but little rain until the month of May, when upwards of two inches fell between the 6th and 7th of that month. June and July were fine, August wet; the spring months of September and October were fine, November and

December severe—constant gales with wet cold weather. In December the thermometer was several times as low as 43°, with snow in quantity on Mount Wellington. The westerly winds include six-tenths of all the winds that blow during the year. The aurora-Australis was not so brilliant in 1848 as in 1847. Its most brilliant appearance was on the 25th of March. On October 18th and November 17th, when it was very remarkable in Europe, it was very indistinctly seen in Van Diemen's Island, probably from the cloudy state of the weather.

A comparison of the quantity of rain which has fallen annually for seven years at

58 QUANTITY OF RAIN IN HOBART TOWN AND IN LAUNCESTON.

Hobart Town shews that there are alternate wet and dry seasons ; thus in—

Year.	Inches.	Year.	Inches.	Year.	Inches.
1842	22.84	1845	15.89	1848	23.67
1843	18.20	1846	22.58	1849	—
1844	24.00	1847	14.02	1850	—

The average of the seven years is upwards of twenty inches, or about the same quantity which falls in London annually.

The climate of that portion of this large island which is open to the Southern Pacific Ocean, necessarily varies in some degree from the coast line opposite to Bass Strait. I therefore give the following abstracts of

meteorological observations at Launceston during the year 1848 :—

Months.	Barometer, at 9 A.M. and 3 P.M.		Thermometer, Extreme Range.	
	Max.	Min.	Max.	Min.

Strzelecki says truly that "the soils, the vegetation, and the diaphanety of the atmosphere possess as great an influence upon the hygrometrical condition of the Australian colonies as that which they so beneficially exercise on the effects of solar heat." Thus in Van Diemen's Island soils formed by the disintegration of greenstones, basalt, and trachyte, give rise to a vegetation characterized by lofty trees, ferns, close-tufted graminæ and mosses, which contribute to prevent the rain-water imbibed by the soil from evaporation; the same vegetation screens the earth from the great absorption of solar heat, and also impedes the terrestrial emission of heat, by which means the temperature of the ambient air is lowered to such a degree as to produce, whenever the atmosphere is clear, a copious condensation of the floating vapours, either in showers, or in the form of dew, if no unfavourable circumstances interfere to prevent its deposition.

DISEASES.—The prevailing maladies will

be seen from the following return of the number of cases treated at her Majesty's colonial hospitals in Van Diemen's Island; also the number of deaths which occurred there during the year 1848 :—

Diseases.	Cases treated.	Deaths.
Fevers	201	8
Diseases of the lungs	357	47
" liver	31	6
" stomach and bowels . . .	256	25
" brain	228	23
Dropsies	14	5
Rheumatic affections	287	2
Venereal affections	230	1
Abscesses and ulcers	439	6
Wounds and injuries	279	8
Diseases of the eyes	553	—
" skin	41	—
Other diseases	561	35
Total	3,475	166

It must be remembered that this return includes principally the convict population, and the most ill-conditioned of about 25,000

people, who are admissible into the colonial hospitals. The proportion of acute diseases is very small, and the mortality on the whole of the cases treated, which must include many persons advanced in years, is only about five per cent. This is a convincing proof of the salubrity of the climate, on which further evidence will be adduced

when treating of the births and deaths in the colony. Invalids from India have benefited by wintering at Van Diemen's Island. Number of insane persons in lunatic asylum at New Norfolk, on 1st January, 1849:—free, males, 37; females, 22 = 59: convicts, males, 75; females, 45 = 120 = 179: in 1848, discharged cured, 20; deaths, 20.

CHAPTER IV.

POPULATION, FREE AND BOND—PROGRESSIVE INCREASE—MARRIED AND SINGLE—BIRTHS AND DEATHS—RELATIVE AGES AND OCCUPATIONS—RELIGION—BENEVOLENT AND CHARITABLE INSTITUTIONS—EDUCATION—THE PRESS—CRIME, AMONG FREE AND BOND.

VAN DIEMEN'S ISLAND, when discovered, was peopled by an aboriginal race, now nearly if not entirely extinct, as stated in the historical chapter. In examining the progress of European population since the formation of the settlement, in 1803-4, I shall endeavour to distinguish the relative number of free and of convict inhabitants; the latter are, however, annually merging into the former, by termination of servitude or by pardon.

The following table presents, at one view, the state of population in Van Diemen's Island, distinguishing the free from the bond, between 1804 and 1847, the date of the last census. Until 1832-3, the number of the aborigines is estimated. No census was taken between 1842 and 1847; and for several years I am not enabled to give the consecutive columns complete. The population, however, is now about 80,000:—

Year.	Free.			Convicts.			Military and Children.		Aborigines.		Total		Grand Total.

The manufactories and trades in operation, in the colony of Van Diemen's Island, on the 31st of December, 1848, distinguishing the number of each, as ascertained from returns furnished by the several police magistrates, is thus stated:—Agricultural implement makers, 47; auctioneers, 9; blacksmiths, 125; breweries, 40; butchers, 127; cabinet-makers and turners, 32; candle manufactories, 10; carvers and gilders, 4; che-

mists, 16; coachmakers, 7; cooperages, 17; corn and ship chandlers, 12; dyers, 2; engineers, 7; fellmongers, 17; foundries, 7; furriers, 3; general dealers, 360; grocers, 44; ironmongers, 15; mast and block manufactories, 3; mills, 80; painters and glaziers, 11; pastry-cooks, 29; potteries, 4; printing-offices, 9; publicans, 376; rope-makers, 3; sail-makers, 6; saw-mills, 8; shipwrights and boat-builders, 51; shoemakers, 246;

POPULATION TO EACH SQUARE MILE—SETTLED DISTRICTS. 61

soap-boilers, 2; tailors, 87; tanners, 40; tin-workers, 32; tobacconists, 11; wine-merchants, 30; woolstaplers, 4.

The official returns to her Majesty's secretary of state, for 1848, includes the following classified account of the population:—

District.	Area in Square Miles.	Males.	Females.	Total.	Population to the Square Mile.	Persons Employed.				Marriages.
						Agriculture.	Manufacture.	Commerce.	Otherwise.	
Bothwell	468	696	277	973	2	227	61	5	680	12

Deaths during the year, 773; births, 1,653; increase, 880.

The increase, during five years, in the population of the townships, between 1842 and 1847, is shewn by a comparison of several of the principal places:—

Townships.	1842.	1847.	Increase.
Hobart Town . . .	14,602	21,429	6,827
Launceston	7,332	10,100	2,768
New Norfolk	1,759	2,384	625
Richmond	4,158	8,219	4,061
Bothwell	958	973	15
Oatlands	1,393	1,594	201
Campbell Town . . .	1,832	2,210	378
George Town	544	546	2
Westbury	817	1,742	925
Horton	330	746	416
Brighton	2,129	2,492	363
Morven	1,924	2,479	555
South Port	252	660	408
Hamilton	330	1,359	1,029
Fingal	697	963	266

The classification of free and bond, for 1847, cannot be relied on, in consequence of a clause in the Census Act, which prohibits the enumeration commissioners from asking the civil condition of any person. Lieutenant-governor Sir William Denison supposes that many "ticket-of-leave" people

returned themselves as free persons. The Comptroller-general of Convicts makes the "ticket-of-leave" holders from three to four thousand greater in number than the census commissioner: thus the total number of convicts, in 1847, would be 27,476; and of the free (exclusive of the military) 40,432. Of this latter number, Sir William Denison says, in a despatch to Earl Grey, dated the 20th of January, 1849, "only 32,211 are really free; the remainder consists of those who have been convicts, and have obtained their freedom by servitude; and many of them are only conditionally pardoned persons."

This observation is incorrect: those who have committed crimes, and suffered the punishment prescribed by law, are "really free;" they are under no legal ban; and may go where they please. Persons who have obtained "conditional pardons," for their good conduct, are free, to all intents and purposes, although they may not be permitted to return to the United Kingdom.

The increase of the whole population, between 1842 and 1847, was from 58,902 to 70,164; about eighteen per cent. for five years, or four per cent. per annum. Among

the free population, the increase is about five per cent.

When we consider that about 58,000 convicts have been sent to Van Diemen's Island between the years 1803 and 1847, it is surprising that the population is not now larger. The colonists, who are opposed to the continuance of transportation to Van Diemen's Island, assert that there has been a large emigration from the island; they estimate the numbers who have quitted it since 1841 at 12,000. Doubtless the temptation of higher wages in the Australian colonies has induced many to pass from Hobart Town and Launceston, to Adelaide, Melbourne, Sydney, and New Zealand; and lately a large number have gone to California. The governor, in a despatch to Earl Grey, of the 3rd of June, 1848, says—"Since April, 1846, there has been an emigration from the colony to the extent of 10,012, all of whom must have been free; though a large proportion, amounting perhaps to half of the whole, have been originally convicts;" and he adds—"The census of December, 1847, compared with 1842, shewed an increase from 57,471 to 67,918; an increase, in five years, of eighteen per cent." The lieutenant-governor, however, omitted to state, that during this period, *i.e.* for the five years ending 31st December, 1847, there arrived in the colony 10,781 male, and 2,904 female prisoners.

Between 1842 and 1847, there arrived free in the colony, males, 715; females, 505 = 1,220. Born in the colony, males, 3,317; females, 3,325 = 6,642.

In 1848, the number of persons who emigrated from Van Diemen's Island was, 3,799; of whom, 2,400 were free persons, 978 persons who have served out their sentence of banishment, and 421 persons holding conditional pardons.* Of the emigrants, 2,797 went to Port Phillip, 280 to Sydney, 415 to Adelaide, and 307 to other places. The arrivals during the same year were, in number, 4,410; of whom, the free people, including troops, were, men, 2,074; women, 491; children, 385; convicts—men, 925; women, 509; children, 26—total men, 2,999; women, 1,000; children, 411. From Sydney there came, 1,014; Port Phillip, 258; Adelaide, 217; New Zealand,

* Thus the merciful policy pursued by her Majesty's government, enables those who have received conditional pardons to seek an honest livelihood in other lands, far away from the scenes of their crime and of their punishment.

60; Portland Bay, Port Fairy, and Port Albert, 255.

The free and convict immigrants from other places were:—

Countries.	Free.			Convict.		
	Males.	Fem.	Child.	Males.	Fem.	Child.
England . . .	197	72	40	438	339	26
Ireland . . .	1	3	7	—	170	—
Bermuda . . .	52	4	4	202	—	—
Gibraltar . . .	54	6	6	240	—	—
India . . .	25	5	8	32	—	—

It is against the transmission of convicts from Bermuda, Gibraltar, India, and other places, that the Tasmanian colonists have more especially petitioned the Queen, as stated in the historical chapter.

That the population has largely increased from births, is indubitable. The years for which I have returns of the registered number of births and deaths prove this.

Years.	Births.	Deaths.
1824	177	132
1828	309	250
1829	301	260
1830	460	270
1831	422	282
1833	455	379
1834	714	557
1835	730	525
1848	1,653	773

We may assume other years to bear a like proportion.

The births and deaths (of free persons) registered during 1848, exclusive of Great Swan Port District, were:—

Sex.	Births.	Deaths.	Increase.
Males	858	463	395
Females	795	310	485
Total	1,653	773	880

The deaths of convicts recorded in the Comptroller-general's department in 1848, were in number 244, shewing a total of deaths in the colony of 1,017, against 1,653 registered births; a net increase of 636. The increase of males and females in the whole population, between 1842 and 1847, has been about—males 17, and females 23 per cent; among the free population solely, 15 and 21. The proportion of married to single is, about 30 married to 100 single; not taking into account the military, or convicts at punishment stations. In 1847 there were 862 marriages, about one per cent. of the whole population.

AGES OF THE INHABITANTS OF VAN DIEMEN'S ISLAND.

63

The registered deaths of *free* males and females during 1848, between 1 and 95 years of age, is thus shewn:—

Years of Age.	Males.	Females.
1 and under 2	23	25
2 " " 3	15	15
3 " " 4	6	7
4 " " 5	5	9
5 " " 10	12	8
10 " " 15	10	6
15 " " 20	9	7
20 " " 25	16	15
25 " " 30	12	17
30 " " 35	23	22
35 " " 40	22	18
40 " " 45	27	12
45 " " 50	27	10
50 " " 55	42	18
55 " " 60	17	10
60 " " 65	12	7
65 " " 70	14	2
70 " " 75	14	5
75 " " 80	17	1
80 " " 85	4	—
85 " " 90	6	—
90 " " 95	1	—

One hundred and twelve male and 89 female children died under the age of one year, and 17 males and 7 females had not their ages registered. The number of children dying under one year old, is in the proportion of 10 males to 7 females. It is nearly in the same proportion between one and five years old.

The relative numbers of registered births and deaths, during the quarters of 1848 ending March, June, September, and 31st December, were:—

Quarters ending	Births.		Deaths.	
	Males.	Fem.	Males.	Fem.
March	187	155	108	94
June	223	209	103	82
September	252	220	104	62
December	216	211	148	72
Total	858	795	463	310

It will be seen from the above, that the greater number of births were in the September or spring quarter, and of deaths in the December or summer quarter. The proportion of deaths generally, is about 1·3 per cent. of males, to 1·5 per cent. of females. The proportion of males to females in the whole population, in 1847, was 100 males to 47 females; this is attributable to the large number of male convicts. Among the free inhabitants, the proportion is, 100 males to 72 females.

The ages of the white inhabitants, excepting the troops, and the convicts at punishment stations, were, on 31st December, 1847—

Years of Age.	Males.	Females.	Total.
Under 2	1,790	1,788	3,578
2 and under 7	3,388	3,443	6,831
7 " " 14	3,133	3,000	6,133
14 " " 21	2,804	2,272	5,076
21 " " 45	26,192	9,479	35,671
45 " " 60	4,078	1,526	5,604
60 and upwards	924	324	1,248
Total	42,309	21,832	64,141

The occupations of the colonists are thus classified for the years 1842 and 1847:—

Occupations.	1842.	1847.
Landed proprietors, bankers, merchants, and professional men	1,846	1,502
Shopkeepers and other retail dealers	802	1,172
Mechanics and artificers	3,720	5,584
Shepherds and others in charge of sheep	879	1,098
Gardeners, stockmen, and farm labourers	9,870	11,693
Domestic servants	3,477	4,839
Other persons not included in the above	27,067	38,291
Military, with their families	—	2,246
Convicts at punishment stations	—	3,739
Total	47,661	70,164

STATE OF RELIGION.—This essential part of abiding civilization was neglected in the settlement of Van Diemen's Island, as in that of New South Wales. Lieutenant-governor Arthur was the first person who endeavoured to remedy the defect; and in this course he was zealously supported by the Legislative Council of the colony, who, on 11th October, 1833, advised that six additional chaplains should be appointed; that additions should be made to the salaries of the presbyterian minister for Hobart Town, and of the Roman catholic priest, and a salary of £100 per annum be granted to a presbyterian minister at Launceston. Archdeacon Scott and Archdeacon (now Bishop) Broughton, of New South Wales, to whom the spiritual care of Van Diemen's Island was then entrusted, pressed (and for some time in vain) this vital subject on the home authorities.

It is distressing to read the following passages, which I have extracted from the despatches of Lieutenant-governor Arthur, Sir John Franklin, and others. Thus, on the

14th October, 1833, Colonel Arthur writes to Mr. Secretary Stanley—

"I have frequently urged upon his Majesty's government the necessity of augmenting the number of chaplains, and I feel I should ill discharge the highest and most important duty I have to perform, were I to neglect on this occasion to second most earnestly the advice of the council. Sir, I pointed out several years ago, as forcibly as I had the power to put it, that *penitentiaries, tread-wheels, flogging, chain-gangs and penal settlements would all prove ineffectual either to prevent or punish crime without religious or moral instruction; there must be a mind to work upon, or all punishment will be utterly un-availing.*

"I entreat I may be permitted again to urge the paramount importance of this point, and, if it be ceded, I importune you no less to cause clergymen to be selected who are devoted to their calling; men of education and mildness, as well as of decided piety. A dignitary of the church holding the office of arch-deacon, upon a most moderate salary, should be placed over the spiritual and temporal concerns of the established church."

Again, on 16th May, 1834, the lieutenant-governor repeats his representations to Mr. Secretary Stanley; I give them in full, because it shews that the colonists were far from being the demoralized class which Archbishop Whateley and other good men erroneously supposed:—

"I had the honour in my despatch of 14th October 1833, accompanying the estimates for 1834, to lay before you an expression of the earnest desire which is entertained by the legislative council, and by the community generally, for an extension of the church establishment, so that the ordinances of religion may be placed within the reach of the more remote settlers, and also be brought home to the convicts labouring on the roads and in the chain-gangs.

"I submit, that in no part of the world are the influence and teaching of the divine and the exertions of the schoolmaster so essential as in Van Diemen's Land, where, in addition to the usual incentives to evil which under every climate and in all situations tend to degrade and demoralise the human mind, there is to be combated that propensity to the commission of crime which is an almost necessary consequence of the habitual indulgence in vice to which a large portion of the convicts have been addicted previous to their transportation.

"While the government coerces these men, while it strives to prevent by the fear of punishment or the promise of reward the actual perpetration of crimes, it is evidently essential to supply them, by the assiduous teaching of properly qualified men, with new motives of action, and to raise up within their minds a power of self-control to prepare them on recovering their liberty for such an enjoyment of it as may not be incompatible with the comfort or safety of others.

"It is therefore with much earnestness that I again recommend for your favourable consideration the suggestions contained in the communications from time to time addressed to me by the successive arch-deacons of New South Wales, after they had in the course of their visitations obtained ocular evidence of the wants of the several districts, and witnessed the desire of the settlers for the plantation amongst

them of churches under the care of pious well-educated clergymen.

"With a view to the erection of these, I have already had the pleasure of informing you that the inhabitants of several districts in the interior have raised very liberal subscriptions, upon the understanding, that in accordance with Sir George Murray's instructions of 1829, the government would assist them with sums equal to those provided by themselves; and, as I have had the honour of reporting in my despatch of the 14th October last, the legislative council unanimously voted the necessary advances, which will shortly be applied in the contemplated buildings, one of which is in progress, and the others are on the eve of being commenced."

On 15th April, 1841, Sir John Franklin, then Lieutenant-governor of Van Diemen's Island, wrote to Lord Stanley thus:—

"I must now again advert to the great want of religious instruction for the large bodies of convicts now under the superintendence of the local government, and to the absolute necessity of steps being taken to send out two pious and practical ministers, whose hearts are in the cause."

These representations, effectively supported by Bishop Broughton, have now produced the most beneficial effect, and her Majesty's government have cordially aided the efforts of the colonists and of the Church Missionary and the Christian Knowledge Society, for the extension of the ordinances of religion to every class of the community.

In 1824, there were in the colony only two church of England establishments, one presbyterian and one Roman catholic; in 1830, the number of churches of England was increased to seven; in 1833, to nine, and in 1835, to twelve.

In 1836, there were two churches of the established religion in Hobart Town, and a presbyterian and a Roman catholic chapel; in Launceston, one church and one presbyterian chapel; at Elizabeth Town, New Norfolk, and at Richmond, Sorell, Clarence, Campbell Town and Norfolk Plains, there was in each place a church, and one was erecting at Ross. The ministers of the established church then consisted of a rural dean, one senior and seven rural chaplains, three presbyterian ministers, one Wesleyan, one independent, and one Roman catholic priest, all paid by government.

In 1842, (24th August) an excellent divine, the Right Reverend Dr. Nixon, whose comprehensive work on the *Catechism of the Church of England* indicated his peculiar fitness for the spiritual office, was consecrated Bishop of Tasmania. In 1843 (27th July), the venerable F. A. Marriott was inducted as Archdeacon of Hobart Town.

The number of temples dedicated to the worship of God in 1848, was, according to

the certificates of the heads of the several denominations,—

Denominations.	No. of places of worship.	No. of sittings.	Average attendance.	Expense borne by	
				Co-lony.	British Treas.
Church of England— Archdeaconry of Hobart	34	13,200	4,940	9,301	£5,086

Note.—The total number of clergymen of all denominations is 97. There is no account of the income of the clergymen paid from other sources. The colonial treasury is charged with £500 a year towards the support of Wesleyan Clergymen, and £150 a year for a Baptist Missionary. To nearly all the chaplaincies glebes and residences are attached.

The number of ministers of religion in 1848, was—the *Church of England Establishment*, a Bishopric of Tasmania; an *Archdeaconry* of Hobart Town district, with thirty-two clergymen, of whom fourteen belong to the town itself; and a *Rural Deanery* of Longford, with fifteen clergymen: the incomes vary from £120 to £500 a year, with, generally speaking, parsonage-houses.

The *Church of Scotland*, eleven ministers, with incomes of from £266 to £486 per

annum, paid from the colonial treasury, and two missionaries, who visit the different out-stations.

The *Wesleyan Methodist Congregations*, seven ministers, with incomes from £100 to £300.

The *Independent Congregations*, seven ordained clergymen, with £100 to £300, with residences.

The *Roman Catholic Church*, under the control of a bishop and three clergymen.

Eight clergymen are attached to the convict department at Hobart Town, Oatlands, Maria Island, Port Arthur, South Port, and the coal mines, but they are permitted to attend other members of their respective churches in their several localities.

The amount paid to each class in 1840, is in gratifying contrast to the past state of religion in this colony; it cannot be said that the people are neglectful of providing the means for the due fulfilment of the holy ordinances to which they are attached.

The amount appropriated for religion from the colonial and home treasury is about £22,000 a-year; but the lieutenant-governor, in a despatch to her Majesty's Secretary of State, dated 3rd June, 1848, says, "although the amount expended, when taken in consideration with the number of the people, may seem to be large, yet, when compared with the wants of the community, originating in their peculiar position, and their character and habits, it is not nearly sufficient for their wants." By the act, 13 & 14 Vic. c. 59 (A. D. 1850), which provides for the formation of a representative government in Van Diemen's Island, it is enacted, that after the establishment of a Legislative Council, a sum of not less than £15,000 shall be annually set apart for the purposes of religion. This sum nearly corresponds with the amount paid from the colonial treasury in 1848, viz., £14,107.

Up to September, 1848, the colonists have erected, without any aid from the revenue of the colony, no less than twenty buildings for the performance of divine service; and private liberality has been exercised to the extent of no less than £36,000, as endowments in land and money, as shewn in a letter from the Bishop of Tasmania, dated 7th September, 1848:—

"Sums subscribed for investments, or expended for church purposes, and value of land given.—Bishopbourne estate.—Endowments for the bishopric, £5,000; Ripon Missionary Fund (including recent subscriptions in England, £10,000; arch-deacon's endowment, £1,500; Paling's farm (valued at), £1,000; Moat farm, £800; allotments purchased and given, £280; land at Hagley, £120; land at Bruin, land at Cullenwood, not known; College estate, £9,000; estimated value of the farm given to the college, £9,000; Grammar-school at Launceston, £700; Hutchin's school (pledged), £2,000; expended in erecting churches, chapels, and school-rooms, £2,436; recent subscriptions to Trinity Church, Hobart Town, £1,000; grant from Society for Promoting Christian Knowledge, on churches and schools, £500; total, £36,136.

"This does not include the large sums expended on

the several churches in the colony, more especially Trinity, Hobart Town; Trinity, Launceston; and Longford: for which three churches alone, many thousand pounds have been subscribed, nor does it include the sums granted for church purposes by the local branch of the Society for Propagating the Gospel, and Society for Promoting Christian Knowledge in Hobart Town.

"The rural dean of Longford has also sent a report of £4,148, (including pew-rents and the offertory), contributed by the members of the Church of England, in the northern division of the diocese during the year 1847, for church and educational purposes, and for the poor.

"It will be seen from this abstract, that 20 buildings have been erected, at the sole cost of the members of the Church of England, where divine service may be performed. For the most part they are in places where no great amount of aid could be expected from the inhabitants."

In addition to this, the bishop says, "latterly we have ensured the services of four additional clergymen, and one catechist for the missionary work of the church.

"With reference to our present and future means, I am prepared to say, that we can furnish a sum of £1,000 per annum, for the promotion of religious knowledge amongst the members of the Church of England in the colony.

"Assuming, then, that the home government does not consider their contribution of £1,200 for the salaries, and £540 for the allowances of the missionaries as too much in consideration of the fearful amount of spiritual wickedness poured in upon us, our own contributions will complete a sum of at least £2,740, as available for the purposes of religious instruction, exclusive of the grants for the same purposes from the colonial treasury.—F. R. TASMANIA."

The Rev. H. P. Fry, A. B., rector of the parish of St. George, Hobart Town, who has resided ten years in the colony, and evidently taken extraordinary pains to make himself acquainted with the actual condition of the convicts, says, in his recent instructive work on *Penal Discipline*, "in no community is religion, in its most spiritual influences, more widely and deeply diffused; in none, is education more generally advocated and afforded: the future prospects of Van Diemen's Island are, therefore, in the highest degree encouraging." And in another place, the reverend gentleman says—

"The incitement to industry and exertion—the profitable field for the human energies—the inducements to marriage, from the advantage of a large family, all the members of which may obtain profitable occupation—the advancement of condition of life, and the abundance and cheapness of provisions, have a powerful influence in directing the minds, and forming the habits of the colonists to industry, rewarded by so many advantages, and withdrawing them from idleness and vice, the evil effects of which are more apparent, and greater in a small community. These natural advantages have withstood the inundations of vice, and enabled the free colonists to maintain the principles and establish the habits of a moral community. If transportation were discontinued, and the colonists, under a free government,

were allowed to exercise their own intelligence, and develop the resources of their country, the stains and evils of having been the receptacle of criminals would speedily disappear."—(p. 205.)

The religious and charitable institutions are numerous, and I can only enumerate them. For *religious improvement* there is the Hobart Town branch of the Society for Promoting Christian Knowledge and for the Propagation of the Gospel; this branch has district associations in different parts of the island; a branch of the British and Foreign Bible Society, the Van Diemen's Land Auxiliary Bible Society, Wesleyan Tract Society, London Missionary Society branch, Van Diemen's Land Colonial Missionary and Christian Instruction Society, and others. Of *charitable institutions* there are St. Mary's Hospital, Hobart Town, opened in January, 1841, on the self-supporting principle, for all classes of society; St. John's Hospital, Launceston, opened 1st September, 1845; St. Paul's Hospital, Circular Head; General Dispensary and Humane Society, Hobart Town; Lying-in Charities, termed the *Dorcas Societies*, at Hobart Town and at Launceston. The Tasmanian Hebrew Benevolent Institution, the Wesleyan Strangers' Friend Society, the Van Diemen's Land Society, for the protection of destitute and unfortunate females, and other truly Christian institutions.

Among the other institutions of the colony, I may mention the Hibernian Benefit Society, established at Hobart Town in September, 1848; the St. Patrick's Benefit Society, established at Launceston in October, 1848; the Launceston Printers' Benefit Society, established in October, 1849; all for the purpose of allowing pecuniary assistance to such members as may need aid, owing to sickness, death of relatives, or other misfortune. There are several *total abstinence* and *teetotal* societies, with branches, for the promotion of temperance. The Juvenile Total-abstinence Society has upwards of 500 members; the Roman Catholic Total-abstinence Society, established in 1846, has 3,800 members; the Van Diemen's Island Total-abstinence Society, established in 1846, has 2,000 members; the Hobart Town Total-abstinence Society, and the Tasmanian Teetotal Society, established in 1842, have each a large number of members. The Hobart Town Mercantile Assistants' Association was formed in February, 1847, for the mutual instruction of the members in the various branches of literature, science, and useful knowledge: it has already a

library of 600 volumes. The Hobart Town Choral Society was established in 1843, for the purpose of cultivating the study and practice of music, and for imparting a knowledge of the science to the children of its members. There are five masonic lodges, and a Tasmanian Masonic Benevolent Fund, established in 1843, for affording relief and assistance to aged and distressed freemasons, their wives, and orphans. There are four Oddfellows' lodges, to assist widows and orphans of deceased brothers, and make allowance to members during illness. For the same laudable objects, there are two lodges of the Independent Order of Rechabites. A Tasmanian Turf Club was formed at Hobart Town in March, 1847; and a United Service Club, open to all officers of both services, has been established at Launceston. It holds general meetings on the anniversaries of the battles of Trafalgar and of Waterloo. There are two Licensed Victuallers' societies, one at Hobart Town, and one at Launceston, established for the same excellent objects as the great Licensed Victuallers' Society of London. Did space permit, I might quote other proofs of the practical benevolence and advanced social state of our fellow-subjects in Tasmania.

EDUCATION has been for some years a matter of primary consideration with the colonists. There are no records prior to the year 1828; but from thence to 1835 the number of government schools, and their expenditure, was—

Year.	No. of Schools.	Number of Scholars.			Government Expenditure.
		Males.	Females.	Total.	
1828	8	242	177	419	£1,964
1829	9	305	219	524	1,887
1830	11	314	249	553	1,188
1831	15	314	254	568	2,512
1832	16	338	262	600	2,323
1833	19	462	394	856	2,967
1834	24	553	450	1,003	12,844
1835	29	667	510	1,177	7,450

Note.—The government expenditure for the year 1834 includes arrears of the orphan schools which had accumulated from 1827.

In 1836, the local government supported seventeen elementary schools alone, and a male and female orphan school, of which the children were divided into four classes: viz.—first, those who are entirely destitute; second, those who have one parent living; third, those who have both parents living, but totally incompetent to afford them the

means of education; and, fourth, children whose parents are to contribute the moderate sum required for the maintenance and education of children in the king's schools, viz., £12 per annum.

The Queen's orphan schools, at New Town, at the expense of British and colonial funds, contained on the 31st of December, 1848—

Description.	Males.	Fem.	Total.
Children of free parents . . .	39	25	64
" convicts . . .	208	188	396
Total . . .	247	213	460

Note.—Of the children of free persons, there are three male and four female, whose parents are aborigines.

The orphan children of convicts are supported entirely at the expense of the British

government; while those of free persons are charged to the colonial treasury, under the head of "pauperism."

The number remaining on the 31st of December, 1847, was 448, viz.—males 229, females 219. Of these, the children of convicts numbered, males 195, females 193 = 388. The children apprenticed during the year were, males 18, females 19; discharged to friends, males 30, females 33; died during the year, males 5, females 6; received during the year, males 63, females 55 = 118; of whom the offspring of convicts numbered, males 51, females 52.

There is a public board of education, and the number of government schools under its superintendence on the 31st of December, 1848, was, according to the inspector—

Locality of Schools.	No. of Children.			Average attendance.	Annual Cost of each School to Colonial Treasury.

Attendance at Infant Schools, December 31, 1848.

Schools.	Boys.	Girls.	Total.	Colonial aid per annum.
Hobart, Murray-street	55	53	108	} £100
" Liverpool-street	14	16	30	
Launceston	26	30	56	
Total	95	99	194	£150

The Van Diemen's Island Sunday-school Union has 22 stations, 154 teachers, and 1,242 children in attendance. The Wesleyans have 17 Sabbath-schools, 122 teachers, and 1,098 children. There are also

other Sunday-schools. There is a Christian Union School of Industry, and a Ladies' School of Industry, at Launceston.

The number of schools in connection with the churches of England and Rome, aided by contributions from the government on 31st December, 1848, was,—

Denomination.	No. of Schools.	No. of Scholars.			Aid from Col. Treasury.
		Boys.	Girls.	Total.	
Church of England	33	852	639	1,491	£1,198
Church of Rome	4	108	213	321	326
Total	37	960	852	1,812	1,524

These schools have been aided conformable to Mr. Secretary Gladstone's despatch, No. 55, so that parents who might object to the system of instruction in operation at the government schools, might have some opportunity of obtaining instruction for their children, according to the system approved by their own church. Nearly 2,000 children are thus provided with instruction who would otherwise have had none.

Private education is also well promoted. The number of private schools, on 31st October, 1848, in different parts of the island, was,—

Police District.	No. of Schools.	No. of Scholars.		
		Boys.	Girls.	Total.
Bothwell	1	22	10	32

Sorell	4	10	22	32
Westbury	2	—	15	15
Total	100	1,285	1,011	2,323

Notes.—There is 1 School at Campbell Town and 1 at Richmond, for which there are no returns; and 5 at Hobart Town, and 6 at Launceston, for which there are no returns. In the return for Great Swanport, the sex is not stated.

The number of children in Van Diemen's Island, in December, 1847, under 14 years of age was, males, 8,311, females, 8,261=16,572. It is reasonable to assume that one-third of this number, or about 5,500 are mere infants; about 4,000 are from 12 to 14 years of age, and valuable for assistance to their parents, who can no longer afford to have them at school,—this would leave about 7,000 children for education; in the returns given, we have records of 5,869, being in course of education, and there are no returns from 14 schools, which, at an average of 50 per school, gives a further sum of 700. It is probable, therefore, that altogether, 7,000 children are being educated in Van Diemen's Island, and I cannot, consequently, agree in the opinion expressed by the Lieutenant-governor to Earl Grey, 3rd June, 1848, that "a population is growing up, of whom upwards of two-thirds are receiving no instruction at all."

The principal educational establishment, termed *Christ's College*, was opened at Bishopsbourne, 1st October, 1846. The

visitor is the learned bishop of the diocese, Dr. Nixon; and the warden, sub-warden, and honorary fellows are men who have attained honours in the British universities. There are three divinity-fellowships. The college is endowed with 4,100 acres of land, of which 3,000 are in cultivation. The annual income is £1,200, chiefly designed to form a reserve fund for building. The High School at Hobart Town was established in 1847, with a capital of £5,000, in shares of £25 each; its object is the instruction of youth in the higher branches of learning. Hutchin's School, which has a foundation fund of £1,065, has the same object. Launceston has a Church Grammar School, opened 1st July, 1846, under the management of a committee. There are Mechanics' Institutes at Hobart Town and at Launceston, with reading-rooms, library, museums, and lectures annually. Among the other institutions, I may name the Tasmanian Society of Natural Science, Agriculture, Statistics, &c., established by Sir John Franklin in 1839; the Royal Society of Van Diemen's Island, founded 14th October, 1843—patron, her Majesty the Queen; to develop the physical character of the island, its natural history and productions; the Midland Agricultural Association, established in 1838; the Launceston Horticultural Society; the Gardeners and Amateurs' Horticultural Society, at Hobart Town; the Bothwell Literary Society; the Launceston Library Society, established in 1845, by shares, and other public libraries.

THE PRESS has for many years been very active in Van Diemen's Island, and proved a severe censor of the local government. In 1848, there were in Hobart Town six newspapers, of which four were bi-weekly and two weekly; in Launceston, two bi-weekly, and one monthly.

CRIME.—In an island which has been, since it first became a British possession, a penal settlement—to which nearly 60,000 criminals have been deported, and where the entire free and bond population was by the recent census in December, 1847, little more than 70,000, the records of crime cannot present a fair comparison with other British settlements. It is however asserted, on credible data, that previous to the large influx of convicts, i.e. about 1840–1, the proportionate number of criminals among the free population was in a less ratio than in England. Into this question of degree I shall not now enter;

when I come to a general view of the social state of the whole of our colonies, the subject may be relatively considered; for the present my duty is to convey to the public the actual extent of crime in the island.

On examining various returns, the first point which impresses itself on my mind is the fearful extent to which the crime of drunkenness even still exists.

The number of cases of drunkenness of free and bond increased from 433 in the year 1824, to 2,841 in 1832; the proportion in 100 of the total population was in the first year three, in the last nine. During the year 1847 the number of cases of drunkenness brought before the magistrates in the nineteen police districts throughout the whole colony, and also at the penal stations of Port Arthur, Maria Island, &c., was of free men (or calling themselves such), 2,588; of convicts, 2,444 = 5,032. Taking the population in 1847 at 70,000, this would give the proportion of drunkards in each hundred of the inhabitants about seven; so far therefore there is some diminution of this crime between 1832 and 1847. By later accounts, of which I have not the details, it appears that intoxication has materially decreased.

The number of persons taken before magistrates in the nineteen districts of Van Diemen's Land during the year 1848, the nature of the offences with which they were

charged, distinguishing free persons from bond, have been compiled from the weekly returns furnished by each magistrate.

Offences.	Bond.	Free.	Total.
Felony and Larceny	1,227	626	1,853
Absconding	854	54	908
Insubordination	116	1	117
Absence without leave	1,754	28	1,782
Disobedience of orders	585	29	614
Drunkenness	2,288	2,967	5,255
Neglect of duty	345	14	359
Insolence	369	6	375
Idleness	48	27	75
Misdemeanour	2,802	165	2,967
Penal convictions under colonial acts and English statutes	308	2,159	2,467
Assaults	257	345	602
Sureties of the peace, and for good behaviour	4	81	85
Various other charges not under the above heads	2,752	446	3,198
Cases under examination	313	87	400
Total	14,022	7,035	21,057

It must be remembered that many of the offences mentioned in this list would not be deemed such, or at least be considered very venial in an entirely free population.

It is, however, very satisfactory to perceive that, notwithstanding the rapid influx of convicts of late years, crime has not materially increased, except during 1844, '5, and '6, when discipline was relaxed, and the number of robberies increased. I understand that, in 1848-9, there has been a marked decrease in crime of every description. The following is an official return, commencing with 1838:—

Crimes against the Person tried before the Supreme Court.

QUARTER SESSIONS—						
Convictions	11	2	46	—	55	6
Total	18	4	96	2	136	7

Of these, the principal crimes were, five cases of murder, one perpetrated by a free-man, and four by convicts.

The number of persons convicted in the colony, who were free at the time of their conviction, and on the registers of the convict department on the 1st of June, 1848, was 658; viz.—92 who arrived free, or were born free; 472 free by servitude; and 94 conditionally pardoned.

There are eight gaols in the colony, viz., at Hobart Town, Launceston, Oatlands, Richmond, New Norfolk, Campbell Town, Longford, and Swansea, capable of containing 151 prisoners in separate cells, and generally 717 prisoners. The total number in confinement at Michaelmas, 1848, was 124 males and 11 females; the greatest number in confinement at any one time in the year,

was 247 males and 23 females. Wherever there is a gaol or watch-house, a surgeon is paid from the colonial revenues for attending upon the constables, and upon any sick persons confined.

The number of executions in the colony, and the crimes for which each individual suffered, in 1848, are thus officially stated:—

Crime.	Free Persons.	Free by Servitude.	Convicts.

Wounding with intent to kill	—	—	2
Total	1	1	14

Flagellation has constituted a large portion of the punishment to which the convicts in Van Diemen's Island are subjected. The number of prisoners flogged during the twelve months ending 30th June, 1846, at twenty-one convict stations and seven police districts was 516, and the number of lashes inflicted was 22,722. At Port Arthur ninety-nine men received 4,110 lashes, averaging more than forty-three each: at Ross twenty-nine men received 1,184 lashes, or forty each. At the coal-mines, eighty-three men received 4,532 lashes, or fifty-four

each. In the police district of Hobart Town, fourteen men received 710 lashes, or fifty each. The average of the whole was forty-four lashes to each convict. It is to be hoped that this demoralizing mode of punishing crime may be by this time less practised, for experience teaches, even though humanity should not have suggested it, that the application of a "cat-o'-nine-tails" usually tends to harden the criminal, and that its frequent use is one of the most effectual means of preventing reformation. *Convict discipline* will be examined in a subsequent chapter.

CHAPTER V.

GOVERNMENT—LEGISLATIVE COUNCIL—LAWS—MILITARY FORCE—TAXATION—REVENUE AND EXPENDITURE—FINANCIAL STATE—BANKS, COINS, AND MONEYS—COMMERCE—IMPORTS AND EXPORTS—SHIPPING—STAPLE PRODUCTS—LAND IN CULTIVATION—LIVE STOCK—PRICES OF LAND—PROFITS OF SHEEP FARMING—WAGES OF LABOUR, AND PRICE OF PROVISIONS—VAN DIEMEN'S LAND AGRICULTURAL COMPANY—VEGETABLE AND ANIMAL KINGDOM.

On the first establishment of a settlement at Van Diemen's Island, its local affairs were administered by a lieutenant-governor, subject to the orders of the governor of New South Wales; in 1825, an Executive Council was appointed, consisting of the lieutenant-governor, chief justice, colonial secretary, colonial treasurer, and the officer in command of the troops. Subsequently a Legislative Council was authorized to be assembled of not more than fifteen nor less than ten members, to be approved by the warrant from the Crown, some to be independent of the government, *i. e.*, holding no office of trust or emolument.

The colonies have for twenty years been petitioning the Crown and Parliament for local legislative authority.

In the act 13 and 14 Vic. c. 59, providing for the better government of her Majesty's Australian Colonies, Van Diemen's Island is included, and the Tasmanians are authorized to form a Legislative Council, not exceeding in number twenty-four, of whom one-third is to be appointed by the Queen, and the remaining two-thirds to be elected by the free colonists, in districts to be fixed for the purpose. This number of twenty-four councillors may be increased by the Legis-

lative Council, but the proportion of members nominated by the Crown must always be one-third of the number elected. The qualifications for an elector are—twenty-one years of age, a natural born or naturalized subject of her Majesty, a freehold estate of the clear value of £100, above all charges or incumbrances, of which the voter shall be seized or entitled, six months before the date of election; or a licence to depasture stock, or a leasehold estate in possession, of the value of £10 per annum. "Provided always, that no man shall be entitled to vote, who has been attainted or convicted of treason, felony, or other infamous offence in any part of her Majesty's dominions, unless he has received a free pardon, or one conditional on not leaving the colony for such offence; or have undergone the sentence passed on him for such offence."

By the seventeenth and eighteenth clauses, it is provided there shall be annually payable to her Majesty out of the revenue funds arising from taxes, duties, rates, and imposts, the several sums mentioned in the following schedules, to be appropriated as therein mentioned:—

Schedule 1. Governor, £2,000; chief justice, £1,500; puisne judge, £1,200; salaries of attorney

and solicitor-general, crown solicitors, and contingent and miscellaneous expenses of administration of justice throughout the colony, £13,300: total, £18,000.—*Schedule 2.* Colonial secretary, and his department, £2,800; colonial treasurer, and his department, £1,800; auditor-general, and his department, £1,600; salary of clerk of executive council, and miscellaneous expenses, £700; pensions, £2,000: total, £8,900.—*Schedule 3.* Public worship, £15,000.

Any bill passed by the Council altering these schedules must be reserved for the signification of her Majesty's pleasure thereon, previous to such alterations being attempted to be carried into effect.

By clause twenty-seventh, the governor and Legislative Council of Van Diemen's Island, and of the other Australian colonies, may—

"Impose and levy such duties of customs as to such respective governors and councils may seem fit on the importation into such respective colonies of any goods, wares, and merchandise whatsoever, whether the produce or manufacture of or imported from the United Kingdom, or any of the colonies or dependencies of the United Kingdom, or any foreign country: provided always, that no new duty shall be so imposed upon the importation into any of the said colonies of any article the produce or manufacture of or imported from any particular country or place which shall not be equally imposed on the importation into the same colony of the like article, the produce or manufacture of or imported from all other countries and places whatsoever."

By clause thirty-one, it is also provided and enacted,—

"That it shall not be lawful for the legislatures of any of the said colonies to levy any duty upon articles imported for the supply of her Majesty's land or sea forces, nor to levy any duty, impose any prohibition or restriction, or grant any exemption, bounty, drawback, or other privilege, upon the importation or exportation of any articles, nor to impose any dues or charges upon shipping, contrary to or at variance with any treaty or treaties concluded by her Majesty with any foreign power."

This latter clause would seem to be at variance with the former, which prevents the colonists levying any differential duties even in favour of the produce or manufactures of England, as compared with those of the United States, France, or other foreign countries; but should the system of "free imports" in England give place to a system of "reciprocity" in the commerce between the United Kingdom and foreign countries, under which corresponding or equivalent duties would be levied in the ports of the nations entering into reciprocity treaties; then, as it appears to me, the two clauses of the bill would be in direct opposition to each other, for the colonial legislatures would be obliged not to act "contrary to or at variance with any treaty or

treaties concluded by her Majesty with any foreign power."

By clause twenty-nine, the Australian legislatures are empowered from time to time to pass acts "for the better administration of justice, and for defining the constitution of courts of law, equity, and of juries; district councils, or in other words, municipal corporations may be established by letters patent from the governor." Full powers are granted by the act to the governor and Legislative Council, to impose such taxes, and make such laws as they deem requisite, and to alter the constitution of the Legislative Council, as regards the qualification of the electors and the elected members, or to establish—

"Instead of the Legislative Council, a council and a house of representatives, or other separate legislative houses, to consist respectively of such members to be appointed or elected respectively by such persons and in such manner as by such act or acts shall be determined, and to vest in such council and house of representatives, or other separate legislative houses, the powers and functions of the Legislative Council for which the same may be substituted: provided always, that every bill which shall be passed by the council in any of the said colonies for any of such purposes, shall be reserved for the signification of her Majesty's pleasure thereon; and a copy of such bill shall be laid before both houses of parliament for the space of thirty days at the least, before her Majesty's pleasure thereon shall be signified.

"33. Provided always, and be it enacted, that the provisions of the said firstly-recited act of the sixth year of the reign of her Majesty, as explained and amended by the said secondly-recited act of the eighth year of the reign of her Majesty, concerning bills reserved for the signification of her Majesty's pleasure thereon, shall be applicable to every bill so reserved under the provisions of this act."

Subject therefore to the ratification of approval by their Sovereign, the colonists of Australia and of Van Diemen's Island, possess a perfectly free constitution, such as no parent state ever before granted to its dependencies.

THE LAWS are those of England; there is a supreme court of judicature, having civil, criminal, equity, and ecclesiastical jurisdiction, and administered by a chief justice and puisne judge; the crown has an attorney and a solicitor-general. The court has four terms, and the judges have six or eight gaol deliveries at Hobart Town and Launceston. Courts of quarter sessions and courts of requests are held in the several districts at stated intervals. The legal practitioners, barristers, attorneys, and proctors have equal rights, and are in number sixty-seven: there are nine notaries public.

Eight of the police magistrates have salaries varying from four to eight hundred a-year; eleven assistant police magistrates received from two to two hundred and fifty pounds a-year, there are beside 248 unpaid, who in 1848, were thus classified—sixty-five naval and military officers, on retired or full pay, twenty-four surgeons, six barristers, nine clergymen, twenty civil officers, nineteen merchants, and 105 other gentlemen. There are also fifty-one coroners residing in different parts of the island, who receive £2 2s. for every inquest they hold, and one shilling for every mile travelled above ten miles from the residence of the coroner

MILITARY FORCE.—The command includes Norfolk Island and Western Australia, and the distribution of the troops in 1849 was, at Hobart Town, 18 officers and 550 men; Launceston, 4 officers and 115 men; Tasman's Peninsula, 2 officers and 105 men; Spring Bay, 1 officer and 25 men; Oatlands, 1 officer and 23 men; Ross, 2 men. Total in Van Diemen's Island, 26 officers and 820 men. At Norfolk Island, 7 officers and 145 men; at Western Australia, 3 officers and 105 men. Grand total in command, 36 officers and 1,070 men. There are a few mounted police, and the constabulary number 506 men, who could soon be made available as a military force. There is no militia. It would seem advisable to employ some of the convict labour in the colony in the construction of forts for large guns at the entrance of the Derwent, near Iron Pot Light-house, and also at the entrance of the Tamar. At present these two cities are at the mercy of any hostile squadron.

REVENUE.—The public income is derived, as in other colonies, from customs duties, licences, rents of crown lands, &c. In 1824, the revenue fixed amounted to £16,866, and in 1834, it had increased to £89,939, the principal items of increase being in the customs duties. Since then the receipts have fluctuated according to the prosperity or depression of the colonists: the following shews the net revenue of 1848, and indicates the nature and extent of the taxation.

Customs—Port of Hobart, £49,527; ditto, Launceston, £27,624: total, £77,151. Post-office—Collections, £5,184; ditto, aid from home government, £1,500: total, 6,684. Wholesale and retail licences to sell wines and spirits, £9,685; auctioneers', pawn-brokers', hawkers', and carriers' licences, £903; fees under port regulation act of council, £171; stage-coach and theatrical licences, £24; fees for registration of dogs, £906; licences under kangaroo hunting act of council, £49. Fees—from judicial

department, £2,671; ditto, civil, £899; ditto, police, £1,801: total, £5,172. Water-rates, £1,185; rent of markets, £800. Tolls on main line of road, Hobart, £177; ditto, Launceston, £28: total, £206. Rents of crown property, £372; miscellaneous receipts, £1,433. Grants from the home government—in aid of police and gaols, £24,000; ditto of witnesses' expenses, £1,000: total, £25,000. Total revenue of 1848, £129,545.

The *Customs Duties*, which form the principal source of revenue, are levied under the provisions of act 10 Vic. No. 7, (July 13, 1846,) which authorizes an *ad valorem* duty of fifteen per cent. on all merchandise of foreign produce or manufacture. By act 12 Vic. No. 8, (October 6, 1848,) wool, coal (for steam navigation), metallic ores, various seeds and plants, the produce of any British colony or possession, are exempt from the fifteen per cent. duty. By act 4 Wm. IV. No. 15, (Jan. 2, 1834,) the duty on British spirits is fixed at 9s. per proof gallon, and 12s. on foreign spirits. The duty on tobacco is 1s. 6d. per lb. There are also wharfage and warehouse dues on goods, and tonnage, pilotage, and light dues on shipping.

The receipts from the sale of crown lands would have been a productive source of revenue, if the high upset price of 12s., and subsequently of 20s. an acre had not been put on these lands. The proceeds of the land sales were, in 1832, £27,536; 1840, £50,894; 1841, £58,039; 1842, 14,332; 1843, £19,804; total, £270,605. 1844, £6,818; 1845, £1,610; 1846, £5,700; 1847, £2,806; 1848, £4,463; total, £21,397.

Here we trace the injurious effects of too high a price in hindering the purchase of land. The falling off in five years of the receipts amounted to £149,208.

The land revenue collected during the year 1848, with the charges thereon, was—

LAND REVENUE:—

Balance on 1st January, 1848	£10,800
Rent of crown lands	17,466
Sale of crown lands	4,463

Balance on 31st December, 1848	24,295

Total £34,519

DETAILS OF EXPENDITURE IN VAN DIEMEN'S ISLAND.

75

The Land Sales act having been repealed, as respects Van Diemen's Island, by the 8 and 9 Vict., c. 95, the Land Fund, in 1847, ceased to form part of the colonial revenue. THE EXPENDITURE for twelve years is thus stated by Sir W. Denison:—

Year.	Civil Establishments.	Police.	Public Works.	Judicial, including Gaols.	Ecclesiastical, and Schools.	Military.	Pensions.	Pauperism.	Miscellaneous.	Total.
1833	£25,261	£564	£11,731	£13,249	£8,050	£603	£1,565	—	£3,764	£74,425
1834	28,620	1,115	18,961	11,821	12,182	1,207	837	—	3,347	78,094

1847	—	15,441		23,500	106,557	64,179	1 13 2
1848	—	—		28,500	112,851	66,000	1 14 2
Total					1,286,311	607,634	—

Note.—The figures for 1848 are an estimate.—In the year 1836 the amount under the head special payments was transferred to convict funds; in 1843 to the same, and to colonial agent; in 1844, and in 1846 and 1847, to convict funds. In the year 1846 the aid from home government was for police and gaols, three quarters of year, £18,750; post office, £1,500; and in the year 1847, for police and gaols, £25,000; lieutenant-governor's salary, £2,000; post office, £1,500.

The detail of the expenditure from the colonial treasury, during the year 1848, is thus given in a document transmitted to the Colonial Office, and signed by the auditor:—

The Lieutenant-governor,* £2,000. *Civil Establishment.*—Customs' department, £4,366; port officer, signal stations, and light-houses, £8,944; post-office, £5,579; government printing-office, £1,235; registrars of births, deaths, &c., £416; other civil departments, £8,050: total, £26,591. *Police Establishment.*—Judges, £2,739; supreme court and law officers, £6,958; courts of requests, &c., £3,750; sheriff, £2,373; gaols, £3,841; coroners' inquests, £494: total, £20,157. *Ecclesiastical.*—Church of

England, £9,301; church of Scotland, £2,936; church of Rome, £1,220; Wesleyan mission, £500; baptist mission, £150: total, 14,108. Day-schools, £5,622; pensions, £446; pauperism, £3,759; Mechanics' Institute and Van Diemen's Land Society, £600; interest on loans, £1,764; miscellaneous, including repayment of an advance by colonial agent to the amount of £4,500 = £9,200. Grand total, £136,193.

The total expenditure in the colony during 1848 was—civil establishment, £121,925; convict establishment, pay of officers, superintendents, and overseers, food and clothing of prisoners, £152,800; military guard and staff officers, including rations, £91,777. Total, £366,502.

The cause of this large expenditure is shewn in the number of free persons employed in the civil government, and in the

* The salary of the Lieutenant-governor is £4,000 a-year; the moiety is paid by the colony.

convict establishment of the colony in 1848:—

Nature of Office.	Civil Establishment.	Convict Establishment.	Total.
Officers, magistrates, &c.	128	141	269
Chaplains & School-masters	68	54	122
Medical men	19	29	48
Clerks	79	51	130
Tradesmen & seamen	42	83	125
Other free persons	111	218	329
Total	447	576	1,023

In order to shew the progressive taxation of the colony and its yearly expenditure, I subjoin a comparative table of the receipts and disbursements for colonial purposes since 1824; the figures between 1826 and 1847 I derive from an excellent almanac called the *Tasmanian Royal Kalendar* for 1847:—

Year.	Receipts.	Expenditure.	Year.	Receipts.	Expenditure.
1824	£32,126	£32,126	1837	£137,354	£141,442
1825	42,345	42,781	1838	127,709	133,680
1826	53,394	50,806	1839	154,789	142,524
1827	53,316	55,057	1840	183,171	154,501
1828	68,673	66,041	1841	185,803	160,974
1829	60,427	44,146	1842	143,712	184,885
1830	67,926	61,513	1843	135,257	166,600
1831	72,119	71,460	1844	164,341	160,585
1832	91,976	80,542	1845	136,983	138,753
1833	86,005	83,727	1846	123,199	122,776
1834	101,016	115,057	1847	150,474	142,497
1835	113,525	116,122	1848	129,545	136,193
1836	128,137	138,380	1849	—	—

Lord Stanley, in November, 1845, pointed out to the Lords of the Treasury the justice of the British exchequer contributing not less than two-thirds of the then existing expenditure of £36,000 per annum, in Van

Diemen's Island, for gaols and police, as at least one-half the population of the colony was composed of people who either were or had been convicts. The Lords of the Treasury, on the 2nd of February, 1846, agreed that £24,000 per annum should be appropriated from the parliamentary grant for convict purposes, towards defraying the expense of the colonial police and gaols; but, in consideration of this contribution, directed that the future proceeds of land sales, together with any other produce of the crown lands, or of the casual revenues which, previous to 1836, were customarily paid into the commissariat chest, and were applicable to convict expenditure, should again revert to that chest. Earl Grey has recently procured from the Lords of her Majesty's Treasury the release of the territorial fund from the commissariat chest, and directed it to be applied towards various public improvements in the colony.

COMMERCE.—The progress of the maritime trade of the colony will be seen by selecting a few years of the period between 1824 and 1848; it should however be premised that the large expenditure from the British treasury for the maintenance of convicts and troops, would necessarily cause the value of the imports to exceed that of the exports. The total value, however, of the imports, for the ten years ending in 1848, was £6,723,472; and of the exports for the same period, £5,899,831: the excess of imports being only £823,641. It will be observed that the value of the trade was much less in 1848 than in 1840, a period of greater speculation than any previous or subsequent year; indeed in 1844 the imports were only £442,988, exports £408,799. The returns do not shew what quantity of the exports had been previously imported.

Imports and Exports of the Colony in several years, from 1824 to 1848.

Countries.	1824.	1830.	1834.	1840.	1844.	1848.
IMPORTS FROM—						
Great Britain	£50,000	£153,478	£316,559	£737,251	£303,097	£460,244
British colonies	10,000	93,251	145,445	217,033	124,675	109,990
Foreign countries	2,000	8,569	14,613	34,072	15,216	23,920
Total	£62,000	£255,298	£476,617	£988,357	£443,988	£594,154
EXPORTS TO—						
Great Britain	£10,000	£52,031	£167,815	£334,156	£252,980	£255,027
British colonies	4,500	93,742	35,399	531,321	151,406	232,718
Foreign countries	—	207	308	1,530	4,413	2,536
Total	£14,500	£145,980	£203,522	£867,007	£408,799	£490,281
Number of tons inwards	11,116	26,582	33,441	—	73,756	91,983

The proportionate import trade of the two principal seaports is indicated in the customs, revenue, and charges collected in each port, year ending January 5th, 1849:—

Duties and Charges.	Hobart Town.	Launceston.
CUSTOM DUTIES—		
On spirits	£24,300	£13,381
" tobacco	10,582	6,966
Ad valorem	10,906	4,862
Total	£45,798	£25,109
CHARGES—		
Tonnage dues . . .	£1,221	£891
Light	831	511
Wharfage	2,325	1,222
Grand total . . .	£50,182	27,633

The export in quantity of some of the staple articles was, from each port, for the year ending January 5th, 1849:—

Articles.	Hobart Town.	Launceston.
Bark, tons	16	266
Barley and oats, bushels	22,312	35,138
Bran	5,670	9,785
Wheat	19,995	192,101
Flour, tons	1,211	1,834
Hay "	525	254
Potatoes "	349	1,570
Wool, bales	6,898	6,529
Cattle, number	—	25
Horses "	124	426
Sheep "	359	2,281
Horns	6,583	5,000
Hides and leather bales	695	161
TIMBER—		
Laths and shingles, number	6,789,000	191,990
Palings "	505,000	1,227,768
Pieces "	24,600	70,984
Trenails "	—	22,483
Staves, feet	210,000	500
Sawn, "	3,487,000	98,300
Oil, black whale, tuns	316	45
" sperm "	654	—
Whalebone, tons	10	1
Tallow, packages	161	123
Hops "	34	22
Malt liquor "	41	443
Fruits and preserves, packages	1820	3,243

The value of the staple exports in 1848 is thus stated in the official returns:—

Wool, £195,143; whalebone, £1,960; timber, £20,464; potatoes, £6,124; salt, £1,090; oil, black, £6,235; sperm oil, £41,074; flour, £32,038; grain, barley, £4,255; malt, £702; oats, £6,084; wheat, £50,863; biscuit, £660; fruits and preserves, £4,917; hay, £3,232; hops, £788; hides, skins, and leather, £9,629; horses, £7,500; sheep, £1,530; malt liquor, £4,265; copper, £2,100—copper ore, £148 = £2,248; boots and shoes, £2,005; beef and pork, £1,255; bark, £902; butter and cheese, £1,043; bags and canvass, £1,255.

It will be observed that wool forms an

important item in the staple exports. The quantity exported in 1814 was only forty bales; in 1824 nearly 1,000; in 1830 nearly 4,000; in 1840 more than 10,000; and in 1850 about 20,000 bales, or 5,600,000 lbs. weight. The value for ten years from 1839 to 1848 inclusive, was £194,647; £123,667; £254,853; £236,078; £193,746; £176,269; £178,647; £213,522; £247,240; £195,143; total, £2,118,812. The quantity exported year by year from 1814 to 1849, is given in the previous Division of this work in the account of the wool trade of the United Kingdom (pp. 618, 619.) The recent discovery of extensive pastoral tracts will probably cause a considerable augmentation in the wool trade of the colony. Agricultural products are next to wool in value; the value of the grain, flour, potatoes, and hay, exported in 1848, was upwards of £100,000. The timber trade is rapidly increasing, owing to the demand in the adjacent colonies, and in California. Potashes from the burnt timber are now being prepared, and it is calculated by Sir William Denison that ten hundred weight, valued at £15, may be obtained from each acre of timbered land. The eucalypti and acacia yield five parts of pure potassa to 1,000 parts of wood. As there is abundance of coal and wood in Van Diemen's Island, establishments for smelting copper ore from Adelaide have been established with success. It is probable, however, that ere long mineral wealth will be added to the property of Tasmania; it is said that a valuable ore of lead has been discovered in the mountain limestone ridge, which extends from Macquarie harbour to the territories of the Van Diemen's Land Agricultural Company. If this be so, copper most likely exists in the same vicinity.

BANKS.—There are three local banks, and the *Union Bank of Australia* and the *Bank of Australasia*, have each branches in the island. In 1823, the establishment of the first bank was effected by a joint stock company, and its issues were made in Spanish dollars at 5s. currency, as it was termed. Up to that time, such was the scarcity of money, that any person circulated at will his promissory notes for dollars, and the parts of a dollar, even so low as three-pence, and the consequent inconvenience, confusion, and loss to the holder, cannot be described. The bank issues, however, rapidly superseded those of individuals, except for the smallest denominations, and they were gradually displaced by the in-

roduction of British copper coin. In 1825 a Treasury order fixed the value of the Spanish dollar at 4s. 4d. sterling, in the king's possessions, where that coin was current for military purposes; and, in 1826, the Legislative Council abolished the currency denominations, and declared that all

transactions should be in pounds, shillings and pence.

The following statement shews the assets and liabilities of the several local Banks and branches of the London Institutions at the end of the year 1848, as extracted from the *Hobart Town Gazette* :—

Banks and Branch Banks.	Estab- lished.	Capital paid up.	Assets.		Liabilities.	
			Bullion.	Bills of Exchange, &c.	Notes and Bills in circulation.	Deposits.
Van Diemen's Island	1823	£80,000	£25,341	£132,667	£10,024	£54,487
Commercial	1829	100,000	29,544	189,105	13,306	90,995
Derwent	1827	120,000	—	—	—	—
Union Bank of Australia—Br.	1838	820,000	87,865	323,814	16,506	105,559
Australasia—Branch	1835	1,200,000	58,341	380,141	19,944	88,039
Totals		2,320,000	£201,093	£1,025,730	£59,780	£339,081

Note.—The Derwent Bank declines to allow a statement of its affairs to be published, as it is not a Bank of Issue. Returns from the Australasian Bank made up to 16th October, 1848.

The coin in the colony on the 31st December, 1848, was :—

In Commissariat chest	£37,000
" Union Bank of Australia	87,865
" Bank of Austral-Asia	58,341
" Commercial Bank	29,544
" Bank of Van Diemen's Land	25,341
" Derwent Bank	—
" circulation, about	10,000
	£248,095

Paper-money in circulation at the same period :—

Union Bank of Australia, Branch	£16,056
Bank of Austral-Asia	16,867
Commercial Bank	13,306
Bank of Van Diemen's Land	10,024
	£56,263

The coins in circulation are gold, silver,

and copper coins, from the British Mint, of every denomination. Spanish and Mexican dollars pass at 4s. each; the dollar with the piece cut out of the centre, for 3s.; the piece so cut out, called a *dump*, for 1s.; half, quarter, and eighth of a dollar, for 2s., 1s., and 6d.; sicca rupee, 2s.; other rupees, 1s. 6d.

These returns exhibit a sound monetary state—the proportion of coin to paper issues is large, and the deposits are of considerable amount. The *Bank of Australasia* is by its charter prohibited from holding mortgages; what proportion of this class of securities may be held by the other banks is not known.

There are three savings' banks, whose state on the 31st of December, 1848, is thus certified by the managers :—

Savings' Banks.	Estab- lished.	Depositors above £10.	Depositors below £10.	Total.	Amount of last Dividend, and when declared.
Derwent (Hobart Town)	1828	115	62	£6,167	4 per cent., Dec. 31, 1848.
Hobart Town	1845	544	775	22,017	4 per cent., Aug. 31, 1848.
Launceston	1835	406	358	15,452	3 per cent. interest added to the principal half-yearly.
Totals		1,065	1,195	£43,637	

Insurance Companies.

Names.	Estab- lished.	Capital.
Tasmanian Fire and Life	1835	£82,300 in 623 sh. of £100.
Hobart Town and Launceston Marine	1836	64,100 in 641 sh. of £100.
Derwent and Tamar Fire, Life, and Marine	1838	100,000 in 2,000 sh. of £50.
Corwall Fire and Marine	1841	10,000 in 5,000 sh. of £10.

There are also branches of the *Australasian Colonial and General Life Assurance*,

and of the London *Alliance, British and Foreign Life and Fire Assurance Company*.

Weights and Measures as in England.

The *Fisheries* at Hobart Town employed in 1848, 37 ships and 136 boats; the fish taken in 1848 numbered 69 *black* whales, giving 480 tons of oil, at £20 per ton = £9,600; 107 *sperm* whales, giving 643 tons of oil, at £63 per ton = £40,509. 210 cwts. of whalebone at £40 per ton = £1,155. Total

value of oil and bone, £51,264. At Great Swan Port, 14 boats were employed in 1848; 1,500,000 oysters were taken, valued at £2,000, and one black whale, valued at £70.

The number and tonnage of vessels *belonging* to the colony is considerable, and increasing; in 1824 Hobart Town had one vessel of 43 tons burthen, Launceston one, also of a like tonnage. On the 1st of January, 1842, there were belonging to the port of Hobart Town, vessels, 162; tonnage, 14,640; to Launceston, vessels, 47; tonnage, 3,772—total, vessels, 209; tonnage, 18,412. The vessels *built* in the colony during the year 1847, were, in number, 29; tonnage varying from 20 to 300 tons and upwards; this branch of business is annually increasing. The timber is adapted for naval architecture, the vessels built very creditable to their constructors, and the price does not exceed £8 per ton. The vessels employed in the fisheries in 1847, were in number, 29; tonnage, 6,081. The coasting-trade between Hobart Town and Launceston, during 1847, employed inwards, vessels, 20; tonnage, 2,136.

The trade of the colony is now in a sound and healthy state; the exports bear a fair proportion to the imports; the staple products are annually increasing, and New Zealand, California,* and other places, require all the food and timber which Tasmania can spare.

The annexed return, showing the number of persons who have declared themselves insolvent, or who have been declared insolvent, in Van Diemen's Land, during the year 1848, exhibits an amount of assets for which it would not be easy to find a parallel in the records of the Insolvent Court in the United Kingdom:—

Quantity of land cultivated, and produce of the principal crops.

Years.	Wheat.		Barley.		Oats.		Potatoes.		Hay	
	Acres.	Bushels.	Acres.	Bushels.	Acres.	Bushels.	Acres.	Tons.	Acres.	Tons.
1828	20,357	314,260	3,864	70,500	1,573	34,168	2,192	4,328	4,970	2,500
1838	41,749	550,189	13,495	182,140	21,575	236,768	3,532	11,501	17,687	15,915
1848	64,700	1,153,318	14,042	331,184	29,463	756,762	3,916	18,231	49,313	43,195

The wheat of Van Diemen's Island is of very superior quality, and brings a higher price in the London market than any other foreign grain; it will doubtless become a

* I may here note a grievance to which the Tasmanian, as well as the Australian colonists, are subjected in the ports of the United States. American meat, grain, and flour are received into British ports *free of duty*, but when our colonists send their pro-

—	Hobart Town.	Launceston.	Total.

Scheduled assets . . .	£4,147	£16,838	£20,986
Insolvencies superseded	2	3	5

POST OFFICE.—The postal arrangements of the colony for the year 1848, shew the active internal intercourse of the inhabitants. —Post-offices in the colony, 51; persons employed, 76; miles of post roads, 634; letters sent from Hobart Town, 125,785; newspapers sent from Hobart Town, 222,522; letters received, 161,571. Two-penny post-offices—franked letters—Hobart, 6,341; Launceston, 221. Total, 6,562. Other letters—Hobart, 9,556; Launceston, 4,757. Total, 14,313. Gross revenue, £7,004 5s. 6d.; gross expenditure, £6,397.

LAND AND PRODUCE.—The agriculture and live stock of the colony has largely increased, as shewn in the annexed table:—

Years.	Acres under Crop.	Horses.	Horned Cattle.	Sheep.	Goats.
1828	34,033	2,034	84,476	553,698	708
1834	69,041	7,115	74,075	766,552	1,070
1841	89,856	12,000	90,498	1,167,737	2,630
1848	171,640	17,196	85,485	1,752,963	2,902

The live stock, especially the horses, are of a good character, care having been taken to import from England thorough-bred animals. Steam navigation between British India and the Australian colonies would give rise to a valuable trade for the remounts of the horse artillery and cavalry of the Anglo-Indian army.

large article of export: the rate at which it may be introduced for sale in Mark-lane, is about 41s. per quarter of 70 lbs.; viz., cost at Hobart Town, 3s., freight, 2s., insurance and duce to the United States, it is met with prohibitory enactments; for example, Australian cured meat is taxed forty per cent. on its introduction into California, and other articles in proportion.

80 AREA, CULTIVATION, LIVE STOCK, &c., IN EACH DISTRICT.

interest on four months' voyage, 2d. = 5s. 2d. per bushel. Thus giving a profit of at least 10 per cent to the importers.

The area, cultivation, live stock, &c., in each district, were, on the 31st of December 1848, as follow:—

Police Districts.	Quantity of land.	Land in cultivation.	Granted or Sold Lands uncultivated.	Granted and sold to Settlers.	Horses.	Horned Cattle.	Sheep.	Goats.	Pigs.
	Acres.	Acres.	Acres.	Acres.	No.	No.	No.	No.	No.

The total number of acres held under depasturing licences on the 31st of December, 1848, was 1,363,427, at a rental of £17,511. More than 11,000,000 acres remain ungranted in the colony.

The number of grants of land, in 1848, under 100 acres, was forty-nine—extent, 1,201 acres; the number above 100 acres, and not exceeding 500 acres, two—extent,

333 acres; the total purchase money, for 1,584 acres, £1,877.

In order to afford an idea of the extent of cultivation in each district, I subjoin a return of the number of acres in the growing crops not gathered in, and probable produce of each crop, in Van Diemen's Island, on the 31st of December, 1848:—

Police District.	Wheat.		Barley.		Oats.		Peas.		Beans.		Potatoes.		Turnips.	
	Acres.	Bushels.	Acres.	Bushels.	Acres.	Bushels.	Acres.	Bush.	Acres.	Bush.	Acres.	Tons.	Acres.	Tons.

Note.—The produce in stock or stores on 31st December, 1848, was:—wheat, 88,393; barley, 27,771; oats, 13,862; peas, 114; beans, 45 bushels; potatoes, 100; turnips, 21 tons.

The supplies required for the prisoners have certainly been a great stimulus to the agriculturists. The estimated consumption of the convict establishments, in 1849, of

articles the produce of the colony, deducting the quantities grown at the convict stations, was—fresh meat, 1,696,853 lbs.; salt beef, 264,990; salt pork, 7,166; suet

and 7,700; vegetables, 2,211; deer, 3,028; bread, 575,566; meat, 27,940; bran, 6,000; peas, 9,490; cattle, 9,954; wood, 7,985,026; straw, 82,175; milk, 174,281 pints; yeast, 2,269; oil, 13,909 gallons. Value £37,232.

The stock slaughtered for food must now be very large; the consumption of sheep and cattle, in the two chief towns, may be conjectured from the following statement:—

Years	Hobart Town.		Launceston.	
	Sheep.	Cattle.	Sheep.	Cattle.
1828	34,090	1,381	—	—
1841	54,391	2,387	—	—
1848	55,376	4,159	18,745	1,476

The price of land necessarily varies, according to fertility and position. The crown lands are put up to auction at 20s. per acre; but the sales are very small. The licence fee for depasturing stock on crown lands is at the rate of £10 per 1,000 acres. In the *Launceston Examiner* newspaper, for December, 1849, there is a list of small farms, of twenty to 350 acres, sold in the Launceston district, on which there was more or less building, clearing, and fencing, and the sale price varied from £4 to £10 per acre. In the Oatlands district, 7,674 acres of pasture land sold, in September, 1849, for 34s. to 40s. per acre.

In November, 1849, a farm at New Norfolk, of 441 acres, with house and other buildings on it, sold for £2 14s. 6d. per acre. At Clarence Plains, 663 acres, with house and other buildings, sold for £2 14s. per acre. In Hamilton district, 3,420 acres of pasture land, with house and other buildings, sold for 14s. 6d. an acre; same district, 4,840 acres pasture land, house and other buildings, 22s. an acre.

The soils are, generally speaking, well adapted for cultivation; and some have been cropped for twenty years successively, without manure. The injurious effect of this course of proceeding is self-evident; for the land, deprived of the mineral ingredients requisite for the food of plants, necessarily becomes exhausted. Professor Liebig, who has so successfully investigated the laws which govern organic and inorganic life, instances a plantation in Virginia, from which harvests of wheat and tobacco were annually obtained for a century without manure; but each year the crop became less and less, and the soil more and more

exhausted; for during this period 12,000 lbs. weight of alkalis, contained in straw, grain, and leaves, were abstracted from the impoverished land. Manuring and irrigation are now being more carefully attended to in Van Diemen's Island, and yield valuable results. Farms of the highest productive power in the island, without manuring or irrigation, yield forty bushels of wheat per acre, in return for a bushel and a-half sown; inferior lands yield from twenty to twenty-five bushels per acre.

Small tenant farmers are now increasing in Van Diemen's Island, and large landed proprietors find it their interest to clear and prepare agricultural allotments for the purpose. For some farms of 100 to 500 acres, partially cleared and fenced, the corn-rent paid is one to three bushels of wheat per acre; for others the money-rent is 9s. to 12s. 6d. per acre, on leases of seven to ten years. Plots of fifty acres are granted for two or three years rent-free, after which annually increasing payments, either in money or corn, are to be made.

The expense of managing a station of 20,000 sheep in Van Diemen's Island in 1849, was—ten shepherds at £16 each = £160; one principal shepherd, £50; five hut keepers, at £12 each = £60. Total, £270. Rations for sixteen men, at £12 each = 192; extra rations for washers, &c., £40 = £232; 200 woolbags, packing (2s. 6d. a bale), cartage, repairs, contingencies and rams, altogether, say £407; shearing, at 10s. per 100 sheep, £100; dressing and washing, £290; rent of 60,000 acres of crown pasture land, at £10 per 1,000 acres = £600. Thus, the total cost for leasing 60,000 acres, and tending, &c., 20,000 sheep, would be £1,810.

The cost for 20,000 sheep, at 5s. per head, is £5,000; if purchased with capital borrowed at 5 per cent = £250, which, added to £1,810, gives an annual outlay of £2,060. Estimating the average annual fleece of full grown Tasmanian sheep at 8 lbs. each = 60,000 lbs., worth all round, 1s. per lb. = £3,000. In addition to this net return of £940 on £2,060, there is the large yearly increase of the flock, say about one thousand, and the annual sale of wethers for market, say another thousand, at 5s. each = £250. It is not therefore surprising that sheep farming is more on the increase than tillage in Van Diemen's Island.

There is indeed no better field for the agriculturist and grazer; and in order to

facilitate the introduction and settlement of small capitalists and other persons capable of employing labourers, Earl Grey, on the 27th August, 1849, authorized purchasers of land of not less than 100 acres for £100, in addition to a credit available at the land sales in the colony, to be entitled to free passages to Hobart Town, for themselves, their families and servants, to the same amount as their deposit, according to the following scale: for a cabin passage, £50; an intermediate ditto, £25; a steerage ditto, £20; two children under fourteen reckoned as equal to one adult, and no charge for infants under one year. His lordship also proposed to assist persons going to Van Diemen's Island under these regulations, with regard to the preparation of land and houses, so as to mitigate the difficulties of a first settlement. Thus, for instance, a person depositing £100 in England, in addition to free passages of the above-named value, would obtain 100 acres of land, with assistance towards the clearing of the land and the erection of his house, to the value in labour and materials of £50 more.

With a view also to encourage emigration to the colony, Earl Grey has caused it to be notified that parties wishing to contribute towards enabling their relatives or friends to join them, may pay into the Colonial Military Chest, such sums as they desire, which will be forwarded to England, and the Lords of the Treasury will contribute a sum equal to that paid into the Military Chest; and with these sums the emigration commissioners will be directed to provide passages to Van Diemen's Island for the parties described in the lists.

Labour.—Tasmania, by means of a large introduction of convicts, has for several years possessed an abundant supply of labour, and furnished a large accession to the labouring classes of the neighbouring colonies; as many as 4,000 individuals having migrated in one year from Van Diemen's Island to the adjoining coast. The wages paid to mechanics in Van Diemen's Island, averaged for the year 1848, without board and lodging, per diem—bricklayers, 4s. 10d.; joiners, 5s.; carpenters, 4s. 8d.; masons, 4s. 10d.; plasterers, 4s. 6d.; painters, 4s. 11d.; plumbers, 5s. 6d.; quarrymen, 8s. 2d.

The prices of food during the same period were—fresh meat, 1½d. to 4d., averaging 2½d. per lb.; wheat, averaging 4s. 6d.

per bushel; flour, averaging £8. 10s. 6d. per ton; vegetables, averaging 5s. 0d. per 100 lbs.

An agricultural association for the promotion of emigration, and the improvement of live stock, called the *Van Diemen's Land Agricultural Company*, was established in London by act of parliament, and incorporated by royal charter in 1825, with a capital of £1,000,000, divided into 10,000 shares of £100 each.

Large tracts of land have been granted by the crown to the company; viz., at Woolnorth, in the north-west part of the island, 150,000 acres; at Circular Head and the coast adjoining, 20,000 acres; at Emu Bay and the Hampshire Hills, 60,000 acres; at Middlesex Plains, 10,000 acres; at the Surrey Hills, 150,000 acres, and in Trefoil, Walker and Robbin's Islands, about 10,000 acres. Total, 400,000 acres. The principal station is at Circular Head, where the commissioner for the company resides. (See residence on map). The Van Diemen's Land Agricultural Company have certainly made great and expensive efforts for several years to clear, improve, and cultivate the land thus granted; but the selections were in several respects unwisely made, and after sinking large sums of money in clearing forests, draining swamps, importing improved breeds of stock, and sending out a superior class of agricultural labourers and their families, the company, it is understood, are now abandoning efforts which gave no return to their shareholders, and directing attention to leasing their lands on favourable terms to tenants. The population on the estates of the company, 31st August, 1849, was stated to be 1,000; cleared land in cultivation by tenants, 2,487 acres; horses in their possession, 104; cattle, 364; sheep, 560; swine, 413. The company have about 1,200 acres of cleared land laid down in English grasses: 3,500 head of cattle, 10,000 sheep, 300 horses and 100 fallow-deer. The paid-up capital of the company is about £220,000, on which no dividend has been paid for several years. The £100 share is now scarcely negotiable.

VEGETABLE PRODUCTIONS.—The vegetation of Van Diemen's Island resembles in its general characteristics that of the adjacent coast. The first botanical investigation was made by Sir Joseph Banks and Dr. Solander, in 1770, and about 1,000 species were collected, principally by Sir Joseph Banks himself, during the first voyage of Captain Cook.

This list was subsequently increased, and when Mr. Robert Brown, the naturalist, engaged on the surveying expedition under the charge of Captain Flinders, commenced his researches, the number of ascertained Australian plants was about 1,300. The industry, talent, and zeal of this gentleman enabled him to add nearly 8,000 to those before known. Of the Australian Flora Brown found that upwards of 2,900 species were *dicotyledonous*,* and 860 *monocotyledonous*: to the last mentioned division 4,000 *acotyledonous* ferns are considered to belong. The *leguminosæ* (such as the pea) and *compositæ* (such as the sun-flower) comprehend one-fourth of all the dicotyledonous, and the grasses form a like proportion of the monocotyledonous plants, of which only one-tenth have been observed in other parts of the world. Of the *cryptogamic* plants (ferns, mosses, mushrooms, &c.) the greater number are to be found in Europe; some, however, are peculiar to Australia and to Van Diemen's Island. By his classification the whole Australian vegetation is divided into 120 natural orders. Since the period when the elaborate *Prodromus Floræ Novæ Hollandiæ et Insulæ* of Brown was published, about 2,000 additions have been made, principally by Cunningham, Ross, Gunn, Hooker, Backhouse, Mitchell, Stokes, and others; so that there are now about 6,000 known species of Australian plants. The greatest mass of vegetation belongs to the natural orders *proteaceæ*, *epacrideæ*, *myrtaceæ*, *leguminosæ*, and *compositæ*;—the most common genera are the *eucalyptæ* and *acaciæ*. According to Backhouse the eucalyptus is said to form seven-eighths of the vast Tasmanian forests. Upwards of 100 species have been discovered; many of them are remarkable for their vast height and enormous dimensions. The *eucalyptus globulus* was observed by Labillardière in Van Diemen's Island to attain a height of 150 feet, with a girth near the base of twenty-five to forty feet. Lieutenant Breton mentions one which he saw of a triangular form, the south-east face of which was 18 feet in length, that to the north 19½, and to the west, 22½; total, 60 feet in girth. The measurements of some large forest trees are given in chapter II., p. 52.

Of the *acaciæ* several of the leafless species have been discovered; the dilated

foliaceous footstalk performing the functions of the true compound leaf; of the genus *casuarina*, which have branches that appear jointed like the stem of an *equisetum*, thirteen species have been found; the *coniferæ* are few in number, but very fine; of the *palms* only six species have been discovered.

The *epacrideæ*, with its allied genera, are very numerous, the *orchidaceæ* diminish in number towards the colder regions. Among the *asphodeleæ* the chief genus is the *xanthorrhæa* (*grass-tree*), of which there are several varieties; of these the most beautiful, namely the broad-leaved *grass-tree*, *richea dracophylla*, is very abundant in certain localities, grows from ten to fifteen feet high, and has numerous branches terminated by spike-like panicles of white flowers, intermingled with broad bracteal leaves tinged with pink. The different species of *xanthorrhæa* are usually found on the poorest soil, and in very open situations.

All the trees are evergreens, and some of them, particularly the *acaciæ*, put forth very rich blossoms in spring; but the colour of nearly all of this description has been remarked to partake more or less of yellow. The foliage is usually of olive-green, varying between that and a browner tint; and the eye wanders over the wide expanse of dense forest, seeking in vain the variety afforded by the deciduous tribes.

Notwithstanding the uniformity of hue which gives something of monotony to their appearance, the forests of Tasmania are of unsurpassed grandeur: sometimes they present spots laid out by the hand of nature; in stately groves, free from underwood; sometimes opening on verdant glades, intersected with crystal rivulets; sometimes skirting an open country of hill and plain, carpeted with rich herbage, and ornamented with isolated groups of the graceful *casuarina*, pine, myrtle, sassafras, and fern trees. But not unfrequently the gigantic forest is rendered impenetrable by thickets of fern and other shrubs (some of which are of great beauty, and produce very elegant blossoms), interlaced by innumerable flowering creepers, presenting pictures such as Humboldt delighted to depict on the banks of the Orinoco.

Among the best known and most commonly used woods in the colony are the—

Stringy bark, which is used for various

* *Dicotyledon*, in botany, means a plant whose seeds are divided into two lobes. In *Monocotyledonous* plants there is but one seed lobe. The *acoty-*

ledonous plants may be said to be devoid of seed lobes, or they have none distinctly traceable. Orders are subdivided into *genera*, *species*, and *varieties*.

building purposes, and has been not unaptly termed the oak of Van Diemen's Island, as well on account of the appearance and durability of the wood, as of the uses to which it is applied. The immense size to which these trees occasionally attain has been previously noticed. Shingles split from them are used in the place of tiles and slates on the houses of the settlers. The bark is brown and cracked.

Iron bark, a name applied in New South Wales to more than one species of *eucalyptus* on account of the bark being exceedingly coarse, hard, and iron-like, is not frequent in Tasmania.

The *white*, *blue*, and *black-butt*ed gum, different varieties of the *eucalyptus*, are used in the colony by shipwrights, wheelwrights, and for fencing, building, &c.; considerable quantities of gum are obtained from these trees, the best is procured from the white gum, *eucalyptus resinifera*, whose bark contrasts with that of the stringy-bark, being smooth, and of a greyish hue.

Among the *casuarinæ* the *she oak* or beef-wood is the most common, and is used for firewood; occasionally the *swamp oak* is, I believe, employed for cabinet work, and also the forest oak.

The *Huon pine* ranks high, both in beauty and value. It is supposed by Backhouse to be a species of *dacrydium*, and attains a height of about 100 feet, and a circumference of twenty-five feet. It is of a pyramidal form, the trunk branches commence about thirty feet from the ground, the others run generally about six feet apart, growing out horizontally until they droop slightly from their own weight; they are clothed with numerous slender pendant scaly green branches, like those of the cypress and *arbor vitæ*, which serve the purpose of leaves. The wood has an aromatic smell; is of a light mottled yellow colour, closer grained and more durable than white American pine; it is much valued for ship and house building, ornamental cabinet work, picture-frames, and general purposes. It derives its name from having been first found in the neighbourhood of the Huon river; it abounds also in the vicinity of Macquarie harbour.

The *Norfolk Island pine* will be described under the head of the locality from which it takes its name.

A species of pine called the *callitris pyramidalis*, is a cypress-like tree, which attains to seventy feet in height, and affords

narrow planks and small timbers, which is useful in building, but not easy to work, being liable to splinter; the wood is of a rich yellow hue, very compact, and possessed of a cedar-like perfume. It is a distinguishing feature of the forests in the vicinity of Oyster bay. The *celery-topped pine* (*thalamici asplenifolia*), is so called from its resemblance at the summit to the well-known esculent of the same name; it attains a height of fifty feet, and two and a half feet in diameter, and is well calculated for the construction of masts.

The *sassafras* (*atherosperma moschata*) is a beautiful tree; it occasionally attains a height of 130 feet, and a circumference of six to seven feet; like many of the *coniferae*, it is conical, and has all its branches of the same year's growth, radiating from one point on the trunk. It is chiefly used for flooring. A decoction of the bark taken with milk has a pleasant taste.

The *myrtle forests* (*fagus Cunninghamii*) in the vicinity of the Hampshire hills have been previously noticed. Backhouse mentions two of these trees as being respectively thirty-two and forty-five feet in girth, and about 150 feet high; but these are exceptional instances, as they rarely in that locality exceed thirty feet in circumference. The myrtle is allied to beech, but has leaves like the dwarf birch; it is suited for the keels of vessels, and is also used for house-work.

The *tea-tree* (*leptospermum lanigerum*, and *melaleuca linarifolia*) is of the myrtle family, it is ordinarily a shrub of about ten feet in height, but in certain localities attains to eighty feet; the leaves are occasionally used as a substitute for tea, but they are too highly aromatic to be agreeable to most palates.

The dark and pale varieties of *Light Wood* (*acaciæ*), so called from its floating in water, while all the other Van Diemen's Island woods generally sink, except that of the pines—is a fine timber, and its roots are much valued for veneering.

The *black and silver wattle* (*acaciæ*) are the gayest of the forest trees when in bloom: their barks contain a large quantity of tannin, which is employed in the preparation of leather; the former yields a gum adapted for sizing silk goods.

Cedar is much used by cabinet-makers, as also those woods locally called the *cotton-tree*, *musk*, *silver-wood*, *plum-tree* and *yellow-wood*. Mill cogs are made of *lignumvita*; boat timbers of red and white *honeysuckle*,

different species of *banksia*, resembling a fir in growth, but having foliage more like a holly. Shingles are sometimes made of *peppermint*, the leaves of which contain a pungent oleaginous substance; gun-stocks of *pink-wood* (*carpodontos lucida*), and the *cypress* or *native cherry* (*exocarpus cupressiformis*) which grows to the height of about sixteen feet, in the form of a cone of bright green colour, bearing a small, red, oval-shaped fruit of a sweet taste, the seed or stone being on the outside. The bark of the *pepper-tree* (*Tasmania fragrans*) contains important medicinal qualities.

Among the handsomest shrubs is the *tulip-tree* (*telopea truncata*), a laurel-like shrub, bearing heads four inches across, of brilliant, scarlet, wiry, flowers, abounding in honey, which is easily extracted by means of the slender tubular stems of grass.

The variety and beauty of the *ferns* and *tree-ferns*, and the extraordinary size to which the latter attain, has been frequently alluded to; the black substance forming part of their stems is used for reeding in inlaying, for which purpose it is superior to ebony; the roots and heart of several descriptions were formerly roasted and eaten by the aborigines; the inner leaves of the grass-tree also serve as food, and there are some wild fruits, but mostly with a thin fleshy pulp, and of an acid quality: the common mushroom abounds. There is an esculent fungus, called "*native bread*," a species of tuber attaining the size of a child's head, and resembling in taste boiled rice: cooking produces little change in its character. The natives say that the bread is found in a rotten tree. An edible fungus is found in clusters, from the size of a marble to that of a walnut, upon swollen branches of the myrtle: when young, its colour is pale and covered with a thin skin that is easily taken off: in this state its taste is like that of cold cow-heel. When matured, the skin splits and exhibits a net-work of a yellowish colour. The *native potato* is obtained from a plant of the orchis tribe, which is brown, leafless, one-and-a-half feet high, with dingy white tubular flowers; it grows among decayed vegetable matter, and has a root like a series of kidney potatoes, terminating in a branched thick moss of coral fibres. The *mesembryanthemum* is the most widely-diffused plant in Austral-Asia, being found on all the coasts; the berry has a sweetish alkaline taste.

The *geranium*, as at the Cape of Good

Hope, grows into a bushy shrub, and is used for hedge-rows. The *castor oil plant* yields the well-known medicine. Some of the low shrubs and creeping plants are of extreme beauty; among them I may notice several species of *epacris*, which resemble heath, bearing white, pink, or crimson flowers, and edible fruit, the *pomaderris elliptica*, with large clusters of small sulphur-coloured blossoms; the *comesperma volubilis*, a climber, the flowers of which, in spring, hang in blue festoons among the bushes, in all parts of the island, and many others too numerous to name.* The climate is in some places too cold for grapes and cucumbers, but apples, pears, quinces, mulberries, and walnuts succeed better than in England. Oaks, ashes, and sycamores raised from English seed attain to three or four feet the first year. There are several native grasses, of which that called Kangaroo grass (*anthistiria Australis*) affords the best pasturage, and is less affected by drought than those of Europe: it grows in bunches, and bears a white convolvulus-shaped flower.

ZOOLOGY.—The animals of Van Diemen's Island closely resemble those of Australia, and are, like them, few in number. (See Division IV., p. 734.) The dingo or native dog, is however, not found in Tasmania, but in its place there is an animal popularly called a hyena or tiger, supposed to be an undescribed variety of *dasyurus*, which, though it flies from man with the timidity of a hare, is very destructive among flocks. It sometimes measures six feet from the snout to the tail. It is striped with black and white on the back, and the belly and sides are of a grey colour. Its mouth resembles that of a wolf, with huge jaws, opening almost to the ears. The legs are short in proportion to the body, and it has a sluggish appearance; but in running it bounds like a kangaroo, though not with equal speed. It belongs to the *marsupial* order, the female carrying its young in a pouch, like most of the other quadrupeds of the country.

The *dasyurus ursinus*, popularly called the devil, is another animal of the same species. It is extremely ugly, with a head somewhat resembling an otter's, but disproportionate to the size of the body; the mouth is supplied with three rows of teeth; the legs short, with feet like the feline race; the tail short and thick, and the skin of a sable colour. When provoked, it gnashes

* See Backhouse's *Visit to the Australian Colonies*, p. 23, and Appendix.

its teeth with great violence, making at the same time a noise not unlike that of a bear: it can exist a long time without food, and is perfectly untameable. It frequents rocky hills, whence it issues at night in search of its prey. The only other carnivorous animals are several sorts of wild cats in the woods, one of which is called the tiger-cat, from its general resemblance to that animal; others partake of the nature of the pole-cat and weazel, in appearance and mode of life, and are between the two in size, being a little larger than the ferret, and not unlike it in shape; they are all great enemies to the poultry yard, and occasionally also to young lambs.

Of the kangaroo (*macropus*), the chief varieties are the *forester*, (which is the largest,) the *brush*, and the *wallabi*. The bound of the kangaroo is prodigious, sometimes exceeding twenty paces, and this can be kept up for some time, so as to outstrip the fleetest greyhound. The abdominal pouch, which this singular animal possesses, is well known; the young attach themselves to the mother's nipple from the earliest instant of their birth, and I have found them adhering to it, when totally devoid of hair—scarcely indeed formed, and without sign of life. Nature seems to have designed the marsupial pouch as a substitute for a burrow or nest; and within its precincts, the careful mother shelters her helpless young, letting them out when they become capable of motion, to graze on the tender herbage, or carefully conveying them across rivers, and through forests, when pursued by her enemies, until they are able to provide for their own sustenance and safety. The kangaroo has rarely more than two at a birth, is extremely timid, unless when hard pressed for life, when it will set its back against a tree—boldly await the dogs—and rip them up with its hind claws, or give them a formidable squeeze with its fore arms, until the blood gushes from the hound's nostrils; sometimes the poor creature will take to the water, and seizing the heads of the dogs as they approach, hold them under water until they are drowned: their tails are of immense strength and thickness. They are extremely docile; I had one for sometime as a pet, which followed me about the house and garden like a dog, eat out of my hand, sat behind my chair at meals, giving me an occasional kick when I forgot to help him as well as myself. This beautiful ani-

mal, which may be considered as peculiar to Australia, is, I regret to say, fast disappearing before the abodes of civilized man; for, as the aborigines say, "where white man sit down, kangaroo go away." Their skins are tanned for leather, and are used with the hair on for making rugs.

The kangaroo rat and the kangaroo mouse are two varieties of the same species; the former is about the size of a rabbit, and the latter is considerably smaller; they have also the ventral sack or pouch on the lower part of the stomach, the short fore paws, and the long hind legs; but the ears resemble those of the mouse. They are night animals, sleeping during the whole day, even when domesticated.

There are two or three kinds of opossums, which usually take up their abode in the hollows of decayed gum trees, and feed on the leaves or branches: they are valued in the colony on account of their skins, which, however, are seldom preserved so as to be valuable as an article of export.

There are two kinds of moles, called the rat and rabbit bandicoot, which burrow underground, and live on roots; both kinds are mischievous visitors to potato grounds, using their snouts to turn up the roots, which they afterwards devour. The flesh of the rabbit bandicoot is considered delicate. There is also an opossum mouse, a pretty miniature of the opossum; it is easily tamed, and lives on a substance called manna.

The wombat (*phascognomys*), is a very singular animal, which, when full grown, weighs nearly forty-three pounds, the largest measure about thirty-two inches in length, and twenty-six inches in circumference. The head is large and flat, the neck thick and short, and the back arches to the loins. The fur is thick, strong, and of a light sandy or dark grey colour. The legs are extremely short; the ears sharp and erect; the eyes small and sunken, but lively; the feet are formed like those of a badger, and the mouth resembles that of a rabbit. The flesh has the flavour of that of the kangaroo, but is far more delicate. The food of the wombat consists principally of leaves and grass; its movements are awkward, hobbling or shuffling: it burrows, is mild and gentle in disposition, but bites hard when provoked, and, in common with many quadrupeds of this island, is a night animal.

The native porcupine (*ornithorynchus hystrix*), in size resembles the common hedgehog, but the spines are ranged in

patches, having one longer than the others protruding from each of the centres; it is perfectly harmless; its natural food is ant eggs. That strange creature called the platypus (*ornithorhynchus paradoxus*), is found here, as in Australia. (See p. 735, Div. iv.)

Of domestic animals I need only observe, that all those of England have been introduced into the colony and thrive well; the breed of horses is excellent, and the condition of the horned cattle and sheep attest the salubrity of the climate, and the richness of the pasturage.

ORNITHOLOGY.—The feathered tribes are numerous, some of them are very handsome, but few can be considered melodious. The largest is the emu, which stands from four to six feet high, and is nearly allied to the ostrich in form and habits; differing from it, however, in some important respects, its covering having more the appearance of hair, or rather, thin strips of whalebone, than feathers; its wings are also much shorter, and as well as the tail, are entirely destitute of those beautiful feathers with which the ostrich is adorned; it is now fast disappearing. Parrots of various kinds, cockatoos, herons, swans, pelicans, &c., are very numerous, as will be seen in the subjoined enumeration of the birds of Van Diemen's Island, derived from the carefully prepared list given by the Rev. T. J. Ewing, in the *Tasmanian Journal of Science*:

Raptores.—The wedge-tail eagle; eagle hawk, and the sea-eagle. The fish-hawk, or white-headed eagle; the peregrine falcon of Tasmania (a rare bird); the little falcon; the lizard hawk; brown hawk; sparrow hawk (the most common species); the white and swamp hawk; the Boobook owl, and the little spotted owl.

Insectivores — *Dentirostres*.—Whistling Dick, the native swallow, the summer bird, the mountain thrush, the spotted thrush or ground dove, the miner, the black-throated robin or ground-chat, the red-throated robin, the pink-breasted robin, the dusky robin, the superb warbler, the emu wren, the brown tail, the yellow tail, the mouse bird or bush sparrow, the silver eye or green linnet, the titlark, the red or green lark, the brown wren (very rare), the thick head or black-crown thrush, the native thrush, the crimson-rumped diamond bird, the striped-headed diamond bird, the forty spot, the fan tail, and the satin fly-catcher. *Conirostres*.—The crow, the white magpie, the black magpie, the pied magpie, the butcher bird, and the fire-tail. *Scansores*.—The musk or forest parakeet, the blue mountain parakeet, the rose hill parakeet, the mountain or green parrot, the swift and the ground parakeet, the swamp and the orange-bellied parakeet, the white and the black cockatoo, the rose-crested cockatoo, and the grey, the brown, and the bronze cuckoo. *Tenuirostres*.—The Jew bird, the sawyer, honey-sucker, the wattle, and little wattle bird; the yellow-throat, the yellow-crowned honey-sucker, the black-cap, the cherry-picker, and the cobblers'

awl. *Fissirostres*.—The three-toed king-fisher, the more-pork (so called from its cry), the little goat-sucker, the wire-tailed swift, the swallow, and the martin. *Rasores*.—The brown, the stubble, and the painted quail; the emu, the bronze-winged, and the little bronze-winged pigeon.

Grallatores.—The heron, the bittern, the pied, and the black oyster-catcher; the bald sultan, the rail, land-rails, the snipe, the godwit, the sand-piper, the avoset, the curlew, the hooded, and the banded doturel; the large-billed doturel, the golden plover, and the spur-winged plover.

Natatores.—The black swan, the Cape Barren goose, the Australian pintail, the mountain, and the musk duck; the teal, the shoveler, the little, and the eared grebe; the large, the little, and the yellow-tufted penguin; the black and the white-bellied shag; the pelican, the southern gannet, the black-backed, and the silver gull; the Cape petrel, or pigeon, the wandering, and the sooty albatross; and four species of *thalassidroma*, whose names have not been made out.

In the above list, the wattle bird, which is about the size of a snipe, and considered a great delicacy, is the only one peculiar to Tasmania.

ICHTHYOLOGY.—The seas around Van Diemen's Island abound with whales and seals; and its shores with shell-fish, particularly muscles — these last literally covering the rocks on its coasts, and in its bays, creeks, and harbours, where various descriptions adapted for food are readily procurable. Fishing, however, is a pursuit little followed in Tasmania, and, consequently, instead of a cheap and plentiful supply, but little is brought to market. The trumpeter is one of the most admired; the other kinds are, salmon* (so called in the colony, but in reality a very poor fish), perch, rock-cod, bream, mullet, whittings, flat-heads, leather-jackets, taylors, parrots, guard-fish, cray-fish (nearly as good as lobsters), oysters (good and plentiful), eels, skate, and shrimps. Some years ago mackarel of a very small species were caught, but latterly they have not been known to approach the island. Black fish are plentiful in the Mersey, and generally weigh from five to fifteen pounds; they have no scales.

The rivers and lakes in the interior abound with very fine eels; but the other freshwater fish are worth little, except the mullet, of which a considerable quantity is annually caught near the falls at New Norfolk. They are in perfection from November to March, and afford sport to the angler, as they readily rise to the fly.

A fish found in the bays and on the shores of the island, and supposed to be a

* The true salmon is not found, I believe, south of the equator; the spawn might be conveyed to Van Diemen's Island in an egg-shell, hermetically sealed, and hatched under a hen, after the manner of the Chinese.

species of toad-fish, is a strong poison. This fish seldom exceeds five inches in length, which is disproportionate to its thickness; the back is spotted like tortoise-shell and of the same colour, the belly is white, resembling kid-skin.

The REPTILES and INSECTS are nearly similar to those of Australia (see Div. iv., p. 736); among the former are several descriptions of snakes, some of which are very venomous; the most common kinds being a large black snake, the diamond snake, and a smaller brown sort. A native brought to me, in Australia, a snake which measured fourteen feet; it resembled somewhat the boa-constrictor I had seen in Ceylon. The colour was very beautiful, chang-

ing rapidly as the reptile became irritated. After carefully securing it, I tried the effect of various poisons; some produced no effect—an infusion of tobacco made it very sick, but large doses of calomel soon destroyed life. The guanas and lizards are common, and considered perfectly innoxious; among the insects are centipedes of two sorts, scorpions and tarantulas; the latter may often be met with in rotten wood. There are also many curious and beautiful varieties of the beetle; three or four sorts of ants, some of which are an inch long, and sting sharply; and a variety of spiders. Bees introduced from England have multiplied with extraordinary rapidity, several swarms having been produced in one year from a single hive.

CHAPTER VI.

TRANSPORTATION—DIFFERENT MODES OF PENAL DISCIPLINE—PRESENT TREATMENT OF CONVICTS—SPIRITUAL AND SCHOLASTIC INSTRUCTION—PUBLIC EXPENDITURE ON CRIME—EFFORTS FOR THE ESTABLISHMENT OF EFFECTIVE SECONDARY PUNISHMENTS.

If in the progress of time it should be decreed in the infinite wisdom of the Omnipotent Ruler of nations, that the wide-spread, and to human eyes, deeply-rooted power of England, should, like that of Babylon and Nineveh, Tyre and Sidon, Rome and Athens, crumble into dust, her future historian may seek among the state archives, the evidences of her extensive dominion and commercial importance, or illustrate from the relics of the fine arts, the scientific acquirements and intellectual cultivation of her children; but if he be a christian, his inquiries will not stop there. Taught by Sacred Writ that "righteousness alone exalteth a nation," he will seek memorials of the "good works," which alike, in a State or an individual, are its legitimate fruits,—and ask, have the hungry been fed, the naked clothed, the sick succoured, and the poor had the gospel preached to them? What efforts, and in a worldly sense, what sacrifices has Britain made to instruct the ignorant—to protect infancy—to guard youth from pollution, and to sustain the feeble steps of age? Has she strenuously and consistently endeavoured to use the ten talents entrusted to her charge for the ad-

vancement, at home and abroad, of Christian civilization? Yet another question remains on a subject of extreme difficulty and vital importance, whether to a heathen or Christian state, but involving in the case of the latter, most solemn responsibilities, and affording a searching test of how far her practical legislation accords with her religious profession.

We know that "offences must come;"—that no human government can wholly prevent the commission of even heinous sin, although it may and does, by ordinances and penalties, impose upon it a salutary check. In what manner crime is to be dealt with, becomes therefore a necessary consideration; how on the one hand, society may be protected from its fearful inroads, and the evil-doer be made an example for the weak, the inexperienced, or the tempted, to shun and not imitate; how on the other, the miserable and misguided sinner himself may best be taught the foolishness of sin, and while enduring the sentence inflicted by the laws which he has violated, may be induced to seek for pardon from a far higher tribunal than that of man.

No surer test can be applied to the reli-

gious principles of an individual or of a nation, than the degree in which they lead to the overcoming evil with good; and the public who have so generously supported this extensive work from its very commencement, will not, I trust, deem time or space mis-spent or misemployed in the enquiry how far England has said to her very outcasts,—“Repent and turn yourselves from all your transgressions, so iniquity shall not be your ruin: cast away from you all your transgressions whereby ye have transgressed, and make you a new heart and a new spirit.”*

Desiring to offer on this important subject somewhat fuller details than would be otherwise consistent with the limits of this work, the following preliminary statements are given in small type :—

In the preceding volume, (Book II., New South Wales, ch. 1, p. 402), I have stated briefly the origin of transportation during the reign of Queen Elizabeth, and likewise the objects which the government of King George the Third had in view when directing the formation of a penal settlement at Botany Bay, in 1788. Previous to this period, the only object of transportation seems to have been to get rid of criminals;—whether they perished at sea, or were sold into slavery, or became a curse and a plague wherever they landed, was equally immaterial to the authorities in England. Indeed, in the report of the select committee of the House of Commons on transportation, in 1838 (p. 1), it is stated that under the statute of 4 Geo. 1, c. 11, “offenders were put up to auction, and sold by the persons who undertook to transport them as bondsmen for the period of their sentences.”

The philanthropist Howard, when sheriff of Bedfordshire in 1773, found the prisons similar to those of China at the present moment, of whose condition some idea may be formed from the fact of the same word in the Chinese language signifying *gaol* and *hell*. His examinations of the prisons and Bridewells of England, revealed a dreadful state of neglect and a vast amount of human suffering. Many who entered them in health, were in a few months reduced to emaciation; some were seen expiring on the floors, of pestilential diseases and confluent small-pox, and the loathsome cells became the hot-beds of a fearful distemper termed the “gaol fever,” which slew thousands. Most of the prisons were scantily provided, and some almost destitute of the necessities of life; without a supply of water within their walls; devoid of bedding or straw; the windows closed up to evade the window tax, while the prisoners, who ought to have been set to work, and who had means of their own, spent their time in sloth, debauchery, and all sorts of vice. There was no distinction of classes, the murderer, the misdemeanant, the debtor, the hoary-headed villain, the profligate and the destitute woman, the comparatively pure and innocent youth, were all thrust into the same den, to “rot or starve,” according to the caprice or interest of the

gaolers of the several county prisons, to whom the unhappy and neglected wretches were generally “farmed out,” at so much per head. Whoever wishes to contrast the period most erroneously termed the *good old times* with the present, need hardly desire a more striking illustration than the conduct pursued by our ancestors, with regard to criminals, affords to the present system, which however is comparatively of recent introduction; the reformation in prisons and prison discipline having been mainly effected within the memory of the existing generation. On this point, the testimony of Mr. Serjeant Adams is very forcible. This able exponent of criminal law, stated before the select committee of the House of Lords, 12th March, 1847, that he “was old enough to remember the condemned cells in Warwick gaol, where prisoners were thrust after sentence to drag out the remnant of their earthly existence in darkness and terror. Imprisonment at that time was accompanied with every species of aggravation and cruelty; in dungeons and darkness, with chains, starvation and torture, terror was the ruling principle; moral influence was unheard of.”

The earliest symptoms of an awakening sense of this important and too long neglected duty, was manifested by an examination of the gaols throughout the kingdom, and by a declaration in 1786, of the objects for which a penal colony was to be founded in Australia, namely, “to provide for the *progressive and ultimate reformation*, as well as the safe custody and punishment of the criminals.

This official declaration was, however, not accompanied by the practical efforts necessary to the accomplishment of its benevolent purport; and I have shewn in the New South Wales division of this work (pp. 409—417), the neglect evinced by the home authorities to the moral and spiritual wants of the convicts sent to New South Wales and to Van Diemen’s Island.

To the credit of several gentlemen in Australia, among whom may be mentioned Archdeacon (now Bishop) Broughton; Judge Burton; the Rev. Mr. Ullathorne, the Roman catholic vicar-general; Sir R. Bourke, the governor of New South Wales, and Sir G. Arthur, the lieutenant-governor of Van Diemen’s Island, strenuous endeavours were made to awaken the home government to a sense of its duties. These efforts were at length successful,—Lord Glenelg and Mr. (now Sir James) Stephen, her Majesty’s secretary and under-secretary of state for the colonies, commenced a series of efficient measures, which have been since then unremittingly pursued by their successors, in these arduous and responsible offices.

It is necessary to remark that the governors of New South Wales and the lieutenant-governors of Van Diemen’s Island, from the period of the formation of these colonies as penal settlements, never received from the government at home any body of instructions for their guidance with regard to the discipline and treatment of convicts, until Lord Stanley, in November, 1842, framed his system, and forwarded it to Sir John Franklin, then lieutenant-governor of Van Diemen’s Island. The reason assigned for this strange neglect of a matter of the highest importance, is that although it devolved upon the secretaries of state for the colonial and home departments, it was not regarded as properly belonging to either, the Secretary of State for the Home Department, declining the attempt to control the conduct of officers with whom he did not correspond, and who were not subject to

* Ezekiel xviii., 27—32.

his authority; the Secretary of State for the Colonies in the same manner refusing to direct or initiate measures on a subject affecting British rather than Colonial interests, and therefore foreign to his duties as head of the colonial department. There was necessarily no stability of purpose whatever in convict management: it was left to the discretion of successive governors, and it seldom happened that during his tenure of office any governor adopted the measures of his immediate predecessor. All the varying plans for the treatment of convicts were of local origin, had mostly for their object local interests, and were executed wholly at the expense of the British Treasury, on whom enormous charges consequently devolved.

This absence of any known and permanent system was among the leading causes of the serious evils, respecting which much misconception and many erroneous statements prevailed in this country. The Archbishop of Dublin in the House of Peers, and Sir William Molesworth in the House of Commons, having directed the attention of the legislature to the subject, a select committee in 1837-8, elicited most distressing facts of a peculiar nature; but it is much to be regretted that the decided bias of the committee against transportation induced them to decline receiving evidence demonstrative of the good that had most certainly been thereby produced; led them to place on record one-sided statements calculated to affix a stigma on the character of the free population, and to adopt the following somewhat summary recommendations:—

1. That transportation to New South Wales, and to the settled districts of Van Diemen's Land, should be discontinued as soon as practicable.

2. That crimes now punishable by transportation should in future be punished by confinement with hard labour, at home or abroad, for periods varying from two to fifteen years.

3. That for the purpose of effectually maintaining discipline and subordination among the convicts sentenced to confinement abroad, of promoting the legitimate ends for which punishment is inflicted, and also of preventing a recurrence of those social evils which have been found by experience to result from transportation as hitherto conducted, the penitentiaries or houses of confinement that may be established abroad, shall (so far as possible) be strictly limited to those places wherein there are at present no free settlers, and wherein effectual security can be taken against the future resort of such settlers.

4. That rules should be established by which the existing practice of abridging the periods of punishment of convicts in consequence of their good conduct, may be brought under stricter regulation, and rendered less vague and arbitrary.

5. That on account of the difficulty which a convict finds in this country in procuring the means of honest livelihood after the expiration of his sentence, and on account of the temptations to which he is thereby exposed, it would be advantageous to establish a plan by which a convict might receive encouragement to leave the country with the prospect of supporting himself by regular industry, and ultimately regaining the place in society which he had forfeited by crime. That if such encouragement were limited to convicts who should have conducted themselves uniformly well during their confinement, it might at the same time operate as an encouragement to good behaviour during confinement, and might considerably diminish the prejudice which

must to a certain degree attach to any person known to have been convicted of a serious offence.

6. That the convicts who have been punished abroad should be compelled to leave the settlement in which they have been punished within a limited period after the expiration of their sentences, and that means should be afforded them by the government for this purpose.

In addition to these specific points the committee urged that "in order to give this experiment a fair chance of success, *much more ample provision* for moral and religious instruction should likewise be made than has been possible for convicts scattered over the extensive surface of New South Wales and Van Diemen's Island."

The partial testimony received and promulgated by the select committee of the House of Commons on transportation in 1837-8, and the refusal of that committee to hear counter-evidence, which would have set forth the whole truth, produced in Van Diemen's Island "serious and heart-felt grief, mixed with honest indignation," such as I have stated in the previous volume (p. 418) to have been excited in New South Wales. A public meeting was immediately called by the free inhabitants, who declared that "the statements set forth by the select committee were without foundation," and they implored their lieutenant-governor, Sir John Franklin, who had then (7th Sept., 1838,) been eighteen months among them, to "do them justice, and make public his opinion of their social, moral, and religious character, so far as the originally free population was concerned." Sir John Franklin promptly responded to this appeal, and gave his high testimony strongly in favour of the "moral and intellectual respectability of the community, whose interests had become his own," and declared that the "free community of Van Diemen's Island need not shrink from a comparison with any population in Great Britain."

In order that the system pursued in Van Diemen's Island and New South Wales at the period of the report of the parliamentary committee of 1838 may be understood and contrasted with that now in operation, I subjoin an outline of the plan then in operation. All male and female convicts on arriving in Van Diemen's Island, without reference to previous circumstances, were either assigned as servants to private individuals, under stipulated regulations, or if there were no demand for their services, they were fed, clothed, and lodged in barracks at the cost of the crown until such demand arose. The assigned were required to live under the roof of their employers; they received no wages for their labour, could not work for themselves, be out at night, or go any where without a pass; were liable to be flogged or imprisoned on the complaint of their master, who on his part was bound to provide his assigned servants annually with two suits of apparel (that of the females not to exceed £7 in value), with proper bedding, and to allow the *males* 10½ lbs. meat, 10½ lbs. flour, 7 oz. sugar, 3½ oz. soap, and 2 oz. salt; and the *females* 8½ lbs. flour, 5½ lbs. meat, 2 oz. tea, 8 oz. sugar, 2 oz. soap, and 1½ oz. salt. The prisoners not assigned were divided into six classes; the first might sleep out of barracks and work for themselves the whole of each Saturday; the second must sleep in barracks, but were likewise allowed to work for themselves on each Saturday; the third, employed on the public works, were released from labour every Saturday at noon, subject to the condition of good behaviour; the fourth class consisted of refractory

or disorderly characters, and were worked in irons either in the towns or on the roads under the sentence of a magistrate; the fifth, a still more degraded class, were also worked in irons and kept entirely separate from other prisoners; the sixth were removed to the penal settlements at Macquarie Harbour or Port Arthur for a definite term, and there classified and worked at the discretion of the commandant, generally a military officer; none but the prisoners and their guards were suffered to remain at these settlements, the labour of the convicts was of the severest description, in cutting timber, &c., and they were subjected to the most severe coercion. A prisoner might ascend or descend through these six classes: if he conducted himself ill, the dreaded seclusion, and punishment of a purely penal settlement were inevitable; if on the other hand his character was marked by progressive improvement, he became eligible for petty employment in the post-office, police, &c., and continued good behaviour would obtain for him the much-prized boon of a "ticket-of-leave," and eventually a conditional or unconditional pardon. A convict sentenced to seven years' transportation could not receive a ticket of leave until he had been *four* years in the colony; if for fourteen years, *six*; if for life, *eight* years. Pardons or emancipations might be attained by those transported for fourteen years, at the end of two-thirds of their sentence; by those under life sentences at the termination of twelve years' good conduct; but one single record of misbehaviour, no matter how slight its nature, would forfeit his claim, and throw back the period of his pardon to an indefinite time.

In 1833, the number of convicts in Van Diemen's Island, subject to this course of treatment, was 15,700; of these, 11,021 were in private service, assigned to various individuals, and supported without charge to the government; 4,679 were supported by government, and of these 478 were at penal settlements, 741 in chain-gangs, 999 on roads, 372 in houses of correction. The average expense of each convict in the colony was £4 6s. 1d.; of each convict maintained by government, including provisions, buildings, clothing, superintendence, &c., £14 9s. According to the payments from the Military Chest for 1833, the average charge to each convict, £8 10s. 4d. In 1835, the average expense of each convict in the island was, £6 1s. 10d.; and of those maintained by government, £18 7s. 8d., the increase being caused by the higher price of meat and flour.

It will be perceived, that under the system explained, the evil of mutual contamination was to a great extent avoided; an assigned convict was cut off from his former evil associates, and if a man of good disposition, he had every prospect of learning industrial habits, and of building up, as it were, a new character. The prospect of a ticket of leave depended on the favourable report of his master, and self-interest as well as right feeling, combined to urge him onwards in a career of reformation. Whatever may be alleged in theory against the system which made the penalties of crime to consist in transportation across the seas, long years of unrewarded labour, accom-

panied by rigid penal surveillance, and the fear of aggravated punishment in the event of aggravated crime, the practical experience of more than half a century in New South Wales and in Van Diemen's Island, demonstrates among its results, that thousands of convicted felons have been thereby reclaimed, enabled to commence a new career, and ultimately to become good citizens, and the fathers of respectable families.

Having now explained the past system, I shall endeavour to place before my readers, in chronological order, the successive changes which have been made in the penal discipline of Van Diemen's Island.

The examination, by the committee of the House of Commons, of the whole subject of transportation, led Sir John Franklin, as lieutenant-governor of Van Diemen's Island, to suggest to Lord Glenelg, then his Majesty's Secretary of State for the Colonies, several alterations in the existing policy, viz.—1st. That the assignment of convicts to be employed for purposes of luxury, or as domestic servants, should be discontinued. 2nd. That all convicts, before being assigned, should be coerced in gangs, under the immediate control of the local government: these gangs to be kept separate from the twice-convicted or punishment gangs. 3rd. A division of the ticket-of-leave prisoners into two classes; the first to be entitled to a certain maximum amount of wages, and to choose their own master, subject to the approval of the chief police magistrate; the second class to be enabled to hold property, real or personal, to attend only the annual muster, to change their residence at their own option, and not to be liable to lose their tickets-of-leave, unless by sentence of the supreme court. These suggestions were approved by Lord Glenelg, on the 6th of July, 1838, and carried into effect on the 17th of January, 1839.

On the 15th of February, 1839, Sir John Franklin stated his reasons for opposing the entire abandonment of the assignment system; and urged some farther modifications of the penal discipline, of which the chief were—the distribution of the convicts, on their arrival in Van Diemen's Island, into isolated, primary or probationary gangs, of about 300 men each, to be conducted as much as possible on the separate system, and employed, at a distance from the settled districts, in clearing and draining, and opening communications to, lands for sale; each gang to be superintended by a half-pay

officer and six overseers, attended by a clergyman, and regularly visited by a magistrate. The conduct of every man to be daily recorded, and the balance of good and bad days to be struck every week, and posted in a ledger. Whenever this record should shew that a convict had to his credit as many good days or weeks as might be equal to one-tenth of the whole term of his sentence (a life sentence being counted as twenty years), he was to be permitted to go into service; to choose a master, qualified by the quarter sessions record with reference to character or the possession of land; and to receive, besides rations, wages; not, however, to exceed £12 per annum. In the event of misconduct, to be dealt with as a convict; but in the case of continued good behaviour for two, three, or four years, to receive, successively, the first and second tickets of leave, before mentioned. If unable to obtain or to retain employment, to return to his gang, or to a separate gang, consisting of other candidates for private service, working within a convenient distance of the settled districts. In this despatch, as also in others, Sir John Franklin, while advocating the propriety of inspiring the mind of the convict with the motives for outward improvement, by making good conduct the sure means of bettering his temporal position, did not omit to express his conviction, that it was undoubtedly the duty of the government to aim at higher results; "for the criminal is, equally with others, within the reach of the gracious designs of Providence; and motives deduced from the gospel, therefore, should be assiduously impressed upon his mind, and cultivated there."* In another place, the lieutenant-governor says—"I am convinced, that were £2,000 per annum expended by her Majesty's government in supporting ten pious and zealous ministers, to be employed, in the interior of this colony, in preaching daily, not in churches, but to the convicts in the houses of the settlers, the benefit to be derived from such a measure would be very great."

The subject was, meanwhile, much discussed at home. On the 23rd of November, 1838, Viscount Howick (now Earl Grey) set forth, in a "Memorandum," his opinions on what he assumed to be the object then in view, namely—"gradually to substitute the punishment of well-regulated imprisonment, at home or abroad, for that of trans-

portation, as now (then) conducted." The bias of mind evinced therein is evidently in favour of a modified system of transportation, as the penalty of heinous offences; but even in extreme cases, his lordship entirely condemned the practice of leaving "the transport for life no prospect but that of wearing out a miserable existence in the most cruel and hopeless bondage;" and therefore recommends the hope of "some termination to their punishment being held out to the most heinous offenders," as an incitement to good conduct.

The leading propositions stated in the memorandum were—1st, the "construction of penitentiaries at home; say, one in England for 1,000 prisoners; one in Ireland for 600 prisoners, and one in Scotland for 400 prisoners: 2nd, the number of convicts sent to the hulks, at home and at Bermuda, to be increased: 3rd, due preparations for the reception of an increased number of convicts of the worst class to be immediately made in Norfolk Island; the system there pursued to be materially altered, prisoners being no longer to be sent there for life, but even the worst class to be recommended for pardon at the expiration of not more than fifteen years; those sentenced for less serious crimes to obtain their pardon in proportionally shorter periods, but none of those sent to this island in a less time than five or six years;" and lastly, that the practice of assigning convicts should be discontinued as far as possible, and a system of discipline introduced in the management of the road and chain-gangs, which should render the labour of the convicts, more productive, and mitigate the evils of their unrestrained intercourse with each other, where such intercourse should be unavoidable.

In January, 1839, Lord John Russell, then secretary of state for the home department, took into consideration the changes proposed by the transportation committee in 1838 (see p. 90), but deemed the subject of such magnitude, that he did not think it advisable to adopt alterations so extensive, without calling the attention of the government to the existing evils, and to their proposed remedy. His lordship therefore drew up "a note on transportation and secondary punishment," for the consideration of his colleagues; the substance of this note (now before me) was to the following effect:—His lordship, began by stating, that the changes made, both in the law and in the

* Despatch to Lord Glenelg, March 11, 1839.

practice, with respect to capital crimes, by which the great mass of offenders were left liable to penalties only short of death, rendered the question of secondary punishment one of very great importance; for instance seventeen executions had taken place in England and Wales in 1836; eight in 1837, and in 1838, only six. Without assenting to the justice of all the representations contained in the House of Commons' committee report, transportation was liable to the objections,—1st, that crime was not punished as crime; 2nd, that assignment like slavery varied according to the temper and character of the master to whom the convict might be assigned, and was therefore unequal as a punishment; 3rd, that the good fortune of many of the convicts destroyed the dread of transportation among habitual and hardened criminals; and 4th, that "while such was the negative effect at home, the positive effect in the penal colonies was most injurious; the masters of slaves imbibing the vices belonging to that condition, the slaves themselves losing all self-respect, and a society contaminated in its infancy, and fed with new streams of pollution in its progress, was created by the express acts of the British Parliament, and carried into effect by the executive government. Lord John Russell then proceeds in this "Note" to quote the declarations of the bishop and of the chief-justice of New South Wales, in which they deny the correctness of the picture of the state of society in the penal colonies, presented in the House of Commons' report; but he frankly avows that these declarations "exhibit in a striking light the total forgetfulness of religion, which existed in the original settlement of the colony, and the culpable negligence of the British government until the last twelve or fifteen years." (See p. 412, Div. iii.) The noble writer then examines with his usual ability, the economical part of the subject, and the comparative cost of keeping the convicts at home, or sending them abroad; deciding in favour of the latter; and after a clear and impartial summary of the opinions of different authorities, his lordship, with "much diffidence and hesitation," proceeds to give an outline of the measures proposed; namely, that convicts sentenced to seven years, should be employed in the hulks and at Bermuda, to undergo two years' confinement certain, at the most irksome description of labour, their conduct to be ascertained, and recorded daily by marks; after

these two years, a period of probation to be entered on, the character of each one to be then composed of three recorded facts,—1st, their crime; 2nd, character previous to conviction; 3rd, conduct during punishment: the probationary period to be alleviated by the mitigation of coercion, or a lighter species of labour, and in some cases, a part of the convict's earnings to be saved and placed to his account until further good conduct might justify an extension of mercy to his case. The same principle to be adopted with convicts transported for more than seven years, but their punishment to be undergone in Norfolk Island or Tasman's peninsula, or in a new colony to be formed in Australia; their periods of probation to be passed either at those stations, or in public works in New South Wales and Van Diemen's Island.

A penitentiary to be built in some part of the United Kingdom for 500 or 1,000 prisoners, on the separate system, for which many convicts would be proper subjects, who from age, or infirmity, might be unable to undergo the fatigues consequent on a long voyage, and yet were not fit objects of mercy.

After grave and long-continued consideration, her Majesty's ministers determined upon the construction of a prison at Pentonville, adapted for the purposes of isolated confinement, and its supervision was placed under the control of a commission, consisting of several distinguished members of the legislature, and other gentlemen who were known to have paid much attention to the difficult question of secondary punishments.

In May, 1839, the Marquess of Normanby, then Secretary of State for the Colonies, officially informed the governor of New South Wales, and the Lieutenant-governor of Van Diemen's Island, of the intentions of her Majesty's government in several important respects, namely, the gradual abolition of assignment with a view to its ultimate abandonment; a diminution for the future in the number of prisoners to be transported, of whom as large a portion as could be received were to be sent to Norfolk Island, a fixed period of imprisonment to be allotted in the first instance as the punishment of crime, but the actual term to be liable to a subsequent abridgment, according to the previous character, nature of crime, and conduct of criminals during punishment; no prisoner to be detained in Norfolk Island longer than fifteen years,

and when allowed to leave to enjoy advantages at least equal to those involved in a ticket of leave; and the "opposite faults of over-severity and over-indulgence to be carefully avoided as alike destructive of any good effect on the prisoners."

In September, 1840, Lord John Russell, then her Majesty's Secretary of State for the Colonies, wrote to Sir John Franklin, informing him (in conformity with an order of the Queen in council, dated 22nd May, 1840,) that transportation to New South Wales was at an end, and that Norfolk Island, Tasman's Peninsula, in Van Diemen's Island, and Bermuda, were the places abroad in which confinement was hereafter to take place. Tickets of leave were to be divided into *several stages*; the convicts under probation to be worked in parties and receive wages for clearing lands, making roads, fencing, draining, &c.; in the first and second stages they were to deposit in the colonial savings' banks a portion of their earnings, to be returned when they arrived at their highest stage.

In June, 1841, Mr. M. Forster, the director of the probation system, laid down certain rules and regulations for the government of the probation gangs, in accordance with which, agreeably to the instructions received from Lord J. Russell, the practice of employing convict overseers was to be discontinued; each probation gang to have a religious instructor as well as a working superintendent, and to be divided into three classes, of which the one composed of the worst characters was to be conducted wholly on the separate system; convicts comprised in the others to be "huttet" in parties of ten to twenty each, but even with them complete separation to be adopted as quickly as possible; watching, cooking, hut-keeping, &c., to be performed by all the men of the gang in turns.

In November, 1842, Lord Stanley, having succeeded Lord John Russell in the colonial department,* assumed for the reasons before

stated (p. 89) the entire superintendence and responsibility of the penal settlements, the pardons of convicts were nevertheless still to be referred to the Secretary of State for the Home Department, and alterations in the general scheme of prison discipline in the colonies were to be concerted between the two secretaries of state.

On 25th November, 1842, Lord Stanley communicated to Sir J. Franklin the views of Sir Robert Peel and her Majesty's ministers, respecting the system of convict discipline to be forthwith adopted, which may be summarily stated to consist in requiring each convict to pass through five distinct stages, from the commencement of his sentence to the attainment of a pardon, namely—1. Detention at Norfolk Island; 2. Probation gang at Van Diemen's Island; 3. Probation pass; 4. Ticket of leave; 5. Pardon, either conditional or absolute. The probation gangs were to be established in different parts of the island; mitigation of toil and petty indulgences to be awarded to the convict according to his conduct in this stage of punishment, from which he might attain comparative freedom as a passholder, becoming thereby entitled to hire himself out in private service, under legal contract made with his employer by the comptroller-general of convicts, as his guardian. This grade to be divided into three classes;—the lowest to pay all their wages into the convict department; the second class, a third part of their wages; and the third class to be permitted to retain the whole of their wages. The money thus paid into the convict department might be forfeited if the conduct of the depositor should cause him to be returned to the probation gangs; otherwise, it would be refunded to him on his obtaining the further indulgence of a ticket-of-leave, whereby he would become a free man, as regarded the community at large—could hold property, and maintain, in his own person, suits at law;† could hire himself to whom he pleased, without con-

* The date of accession to office of the several successive Secretaries of State for the Colonies, since the formation of the Colonial Department, are as follows:—Lord Hobart, 1801; Marquis Camden, May 14, 1804; Viscount Castlereagh, July 10, 1805; Right Hon. Wm. Wyndham, February 5, 1806; Viscount Castlereagh, March 25, 1807; Earl of Liverpool, October 11, 1809; Earl Bathurst, June 11, 1812; Viscount Goderich, April 30, 1827; Right Hon. Wm. Huskisson, September 3, 1827; Sir George Murray, May 30, 1828; Viscount Goderich, May 22, 1830; Right Hon. E. G. Stanley (now Lord Stanley), April 3, 1833; Right Hon. T. S. Rice (now

Lord Monteagle), June 5, 1834; Earl of Aberdeen, December 20, 1834; Right Hon. C. Grant (now Lord Glenelg), April 18, 1835; Marquis of Normanby, February 20, 1839; Lord John Russell, September 20, 1839; Lord Stanley, September 3, 1841; Right Hon. W. E. Gladstone, December 23, 1845; Earl Grey, July 6, 1846.

† By act 2 & 3 Wm. IV., c. 62, whereby provision is made for the abolition of the punishment of death in certain cases, and the substitution of a lesser punishment in its stead, it was among other things enacted that the governors of a penal settlement could not give a pardon or ticket-of-leave until the

trol or limitation : but should he commit any crime or offence deemed deserving of such punishment, the government could throw him back on the previous stages of either a passholder or probation man. Each probation gang to have a clergyman or a schoolmaster attached; reading and writing to be taught to the convicts after work; a rigid system of discipline to be maintained; religious instruction carefully attended to; and the whole placed under the direct management of a comptroller-general.

No convict was to obtain a ticket-of-leave before half the term of his original sentence had expired; and in case of persons sentenced for life, that indefinite term was to be counted as *twenty-four years*. No conditional pardon was to be granted to a ticket-of-leave holder, unless he had held it for three months, eight months, one year, or two years, according as his original sentence might have been for seven, ten, fifteen years, or for life. Under the operation of this rule, a convict sentenced for seven years was compelled to serve four years and nine months; if for ten years, six years and eight months; if for fifteen years, ten years; and if sentenced for life, fifteen years must elapse before he could receive the final indulgence of a pardon for good conduct. To these periods about one year would be added before the authority of the crown could be received for the issue of the pardon.

The desired effect of the whole scheme was to impose a very formidable punishment at the commencement of a convict's sentence, which should gradually relax in severity with the lapse of time, each successive mitigation being expedited by good conduct, or retarded by bad. The probation gangs were deemed the pivot of the system, as all would necessarily, in passing through them, be observed, closely superintended, and

person, if transported for seven years, should have served four years; if for fourteen years, six years; if for life, eight years of labour; and that no such person shall be capable of acquiring or holding any property, or of bringing any action for the recovery of any property until he should have obtained a pardon. By act 6 Vict., c. 7 (3rd of April, 1843), the power delegated by the crown to governors of granting pardons was revoked, and they could only recommend such persons as were deemed worthy of that boon, the decision of her Majesty being conveyed through one of the secretaries of state. The enactment by which ticket-of-leave prisoners were disqualified from acquiring or holding personal property, or of maintaining an action for the recovery of the same, was also revoked, it being deemed "just that they should be protected in their persons and in the

brought within the reach of moral and religious influences. To this primary stage, from which all would be anxious to emerge, the incorrigible and refractory might be sent back—a punishment the most easily inflicted, the most formidable, and which was expected to prove the most effective. The working of the system was divisible into six heads, and information was expected on the following points:—1. Condition of the convicts; 2. Working of the system; 3. Results of experience in detecting errors; 4. Best means of correcting them; 5. State, efficiency, and expense of each department; 6. Most effectual method of promoting economy and efficiency in this branch of the service.

It seems scarcely possible to have devised a plan more theoretically complete; yet, in its practical working, it fostered the most fearful social evils; for there is abundant, and very painful evidence, that great immorality and crime took place among the convicts thus herded together in gangs. The documents laid before parliament, and the facts collected by the Rev. H. P. Fry, A.B., prove this beyond dispute.*

In addition to the rapid influx of convicts in 1842, '3, '4, '5, rendering it difficult for the existing amount of free labour in the colony to find remunerative employment, the island suffered pecuniarily by commercial embarrassment, and by the check which its prosperity received from the high price put upon the sale of the crown lands, which completely stopped free emigration. The convicts who went into the interior to procure work, were therefore obliged to return to the "hiring depôts," where the government was bound to support them. The state of the colony became more and more alarming; transportation was suspended to Van Diemen's Island; and towards the close of 1845, Lord Stanley

possession of such property as they might acquire by their industry, while holding such tickets of leave;" but whenever such ticket-of-leave should be revoked, all property so acquired by any such felon shall vest absolutely in her Majesty, and be disposed of at the discretion of the governor, subject to instructions from the secretary of state." By this act a ticket-of-leave holder is nevertheless declared incapable of holding real property—i. e., "of acquiring or holding any estate in lands or tenements, other than as tenant for years."

* I am unwilling to do more than refer to these documents, for the details they contain are loathsome and repulsive in the extreme, and the crimes of which they treat are quite unfit subjects for discussion in a work written for the many, not the few.

expressed his conviction, that it became an indispensable duty promptly to make some effective provision for relieving Van Diemen's Island from the constant and increasing pressure of the large body of pardoned convicts who were vainly seeking the means of an independent and honest subsistence: he, therefore, proposed to found a new colony on the east coast of Australia, of which the southern boundary should be the 26th degree of latitude; the settlement to be called *North Australia*, to be chiefly, but not exclusively, a receptacle and place of refuge for liberated convicts or "exiles," male and female, with a local government on a very frugal scale; the prisoners, on landing, to receive pardons, and for one year after arrival to be provided with rations, clothing, tools, seats, bedding, and tents for immediate shelter; such allowances to terminate three years after the foundation of the colony. The exiles receiving rations to be bound to work, not only in preparing their own habitations, but also in effecting such public works as might be deemed absolutely necessary. The despatches dated September and 21st November, 1845, in which the views and policy of Lord Stanley are expounded, are masterly state papers, especially the former, which received the strongly-expressed encomium of Sir James Graham, then her Majesty's Secretary of State for the home department, who concurred in the opinions therein expressed.

Mr. Gladstone, who succeeded Lord Stanley in the Colonial Department, prepared in May, 1846, to carry out his views with respect to the planting of the North Australian colony by "exiles," at Wide or Hervey Bay, for which the assent of the Lords of the Treasury was obtained on the 2nd of February, 1846, and letters patent were accordingly issued by the crown. The male "exiles" were to receive each, allotments of five to ten acres of land, to be paid for after the lapse of three years, by regular instalments; purchasers of twenty to forty acres were to spread their half-yearly payments over a period of ten years. While these and other measures were in progress, the ministry to which the right honourable gentleman belonged was terminated by the retirement of Sir Robert Peel, and the accession of Lord John Russell. Mr. Gladstone was, however, long enough in office to evince an anxious desire to follow out the just and liberal views of his predecessor, and the despatches which he

transmitted to the colonies bear strong testimony to the opinions he had uniformly expressed concerning the necessity of making the spiritual condition of the provinces a primary consideration.

Earl Grey succeeded Mr. Gladstone. I have previously shown, that when Viscount Howick, his lordship had acquired a considerable knowledge of colonial affairs, had sat as a member of the House of Commons' transportation committee, in 1837-8, and from the commencement of his public life had devoted high faculties, great energy, and untiring business habits, to all subjects affecting the poor and suffering classes of society. On assuming the seals of office, Earl Grey concurred with Lord Stanley in the necessity of suspending transportation to Van Diemen's Island, and declared the intention of her Majesty to do so altogether for two years; but on the 15th of November, 1846, his lordship announced the dissent of the new ministry to the design proposed by Lord Stanley, and partially carried into operation, of establishing the settlement of North Australia, as being an "impolitic and needless measure;" the letters patent, which had been issued were, therefore, under the advice of her Majesty's confidential advisers, revoked. The "probationary system" having proved (in some respects) so deeply injurious, the difficult question of secondary punishments seemed more perplexed than ever; at length, the following changes were resolved upon:—1st. That penal labour should be inflicted at home, previous to deportation, because a more vigilant and careful superintendence could be carried out in England, than was possible in a distant colony. 2nd. That penal labour should be preceded by separate confinement in properly constructed prisons for a limited period. 3rd. That after prisoners had endured the separate confinement and hard labour, they should not be sent out as convicts, but as "exiles." A bill in conformity with these intentions was therefore laid before parliament in 1847; objections to it were taken in both houses of the legislature, and a select committee was appointed by the Lords, for the better understanding of the subject. In the meantime, public opinion in the colonies pronounced against the plan, unless tried with various modifications.

In 1848 it was decided that convicts, after suffering a certain degree of punishment at home, should be sent to the colo-

nies; and, in order to provide the means of inflicting this sufficient degree of punishment, by a system of separate imprisonment, her Majesty's government, in 1850, introduced and carried through parliament a "Convict Prisons' bill," for the purpose of placing Pentonville, Parkhurst (the gaol for juvenile offenders), Millbank, and the Portland Island hulks and establishment, under the control of commissioners appointed by the Secretary of State for the Home Department.* These four prisons contained about 5,500 convicts sentenced to various periods of transportation, and the necessity became evident, that they should be governed on a uniform system. By means of solitary cells in these gaols, and by arrangements with several of the county prisons, whereby about 2,000 additional cells were placed at the disposal of her Majesty's government, it was determined to subject each convict under sentence of transportation, to twelve or eighteen months' solitary confinement. There are satisfactory grounds for believing that the seclusion of a criminal for a limited period, is the most efficacious reformatory discipline to which he can be subjected; this is indicated by the small number of re-committals of persons who have endured it, in comparison with those who have suffered other descriptions of secondary punishment. Shakspeare has well said, that "conscience doth make cowards of us all;" and the convicted criminal certainly forms no exception to the axiom placed by him in the mouth of the guilty Macbeth, for there is conclusive evidence that a felon would

* It may be necessary here to state, that of late years the condition of the gaols in the United Kingdom has engaged the attention of Parliament more than any other subject. In 1822 a committee of the House of Commons was appointed to inquire into the state of prisoners and prison discipline in England and Wales, and in 1823 an act (4 Geo. IV. c. 64) was brought into Parliament by the late Sir Robert Peel, which declared that "due classification, inspection, separation, regular labour, employment, and religious and moral instruction, are essential to the discipline of a prison, and for the reformation of offenders; and that the laws ought to be so amended as would uniformly and strictly carry into effect such a system." By this legislative enactment, all the previous acts relating to prisons were consolidated or amended. In 1835 a comprehensive report of the House of Lords on prison discipline, strongly insisted upon the necessity of hard labour, religious instruction, and separation, with a view to prevent contamination. The act 5 & 6 Wm. IV., c. 36 (1835), gave power to the Secretary of State to lay down rules for the management of prisons, and to appoint inspectors. By

DIV. V.

far prefer the scanty food, the sloth, the filth, the vermin, of such a place as Newgate, where he might gamble for his supper, learn new tricks, instruct the novice, sing, play, and quarrel, by turns, in the night-room, to the wholesome diet, cleanliness, and comparative comfort, of a prison, in which he would be separated from all his fellow-criminals, and left to his own reflections.

After undergoing solitary confinement for twelve or eighteen months—which appears to be the longest period any man is capable of sustaining it, without serious and permanent injury to his mental and corporeal system—the convict is to be employed at public works, such as the Harbour of Refuge at Portland, on the south coast of England, where, under the excellent superintendence of Captain Whitty, upwards of one thousand male prisoners have been occupied during the past year.

Another feature of what, for the sake of clearness, I may term the newly-adopted system for punishing and reforming convicts at home, is, I believe, to keep a considerable number, at Dartmoor, where the French prisoners were confined during the last war. The existing prisons are large, and capable of subdivision, so that prisoners may be classified and separated. The area of Dartmoor is about 100 miles square; its mean height above the level of the sea, 1,200 feet. A large part of the surface consists of peat bogs, varying in depth from two to twenty feet, and minerals are said to abound; ancient shafts are not unfrequently exposed. It is proposed to reclaim Dartmoor, by draining and divesting it of the act 2 & 3 Vict., c. 56 (1839), individual separation is permitted in prisons, when a certificate of the general fitness of the cells shall have been obtained from the Secretary of State. Between 1822 and 1850, there have been several committees of both houses of Parliament, and the general views expressed may be summed up in the words of the report of the committee of the House of Commons, dated the 29th of July, 1850, namely, that "a great majority of convicted prisoners are open to the same good motives and good impulses which influence other human beings, and therefore that a system of encouragement to good conduct and endeavours to inspire feelings of self-respect, self-reliance, and hopefulness for the future, which have been tried in some of our largest establishments, ought to be adopted, so far as it is practicable, without impairing the penal and deterring character essential to any system of imprisonment." And the committee further declared their opinion, "that under any system of discipline, the best practicable arrangements should be made for the instruction of all prisoners in their religious and moral duties."

C

the superincumbent peat-moss. The labour of the prisoners may thus be rendered useful, and the convicts, by continuous agricultural industry, weaned from criminal habits, and so instructed as to be enabled to procure eventually an honest livelihood in the distant agricultural possessions of the crown. The project is good in principle, and likely to prove efficient in practice; for there appears no better prospect of a man of vicious habits being reclaimed, and the moral energies necessary for the conquest of his evil passions, called into existence and strengthened, than by some employment connected with the tillage of the soil, where the wonderful designs of his Maker are continually manifested, where seed time and harvest have their appointed seasons, and where the merciful provision for human wants, hidden in the bosom of this fruitful earth, testifies the will of the Creator, that man should eat bread by the sweat of his brow. The monotonous labour of quarrying stones, and rolling them into the sea for a breakwater, affords far less opportunity for influences of this nature.

To return—prisoners who prove incorrigible in the gaols of the United Kingdom, or during employment on public works at home, at Gibraltar, or at Bermuda, are sent to Norfolk Island; those male convicts in Van Diemen's Island, who become too refractory for the probation gangs, or commit fresh crimes, are forwarded to Port Arthur, and subjected to severe discipline and hard work; should this fail in reforming them, they also are dispatched to Norfolk Island, a description of which will be given in a subsequent part of this work. The latest detailed account which I have received of the system pursued in Van Diemen's Island (but which probably even now is undergoing alteration), may be thus summarily stated. On the arrival of a convict ship in the colony, a registrar of convicts takes a correct description of every individual before landing, records his general character and conduct during the voyage, and classifies the whole according to crime, registering the offences they have respectively committed. The prisoners are then distributed in gangs of not less than 110 men; each gang available for employment in the construction or repair of cross roads, or such other public works as may be approved by the Lieutenant-governor, provided that the public bodies, or private individual, applying for the services of such gangs furnish proper

quarters for the officers and convicts, supply the requisite tools, and pay into the commissariat chest the cost of the superintendence, which is estimated at the rate of £4 10s. per annum for each convict, if the supply of labour be guaranteed by the government for twelve or eighteen months; if not guaranteed for any certain period, then from £2 10s. to £3 10s. per man.

The system of task-work is carried out with satisfactory results in the probation gangs; the men are divided according to their capacities or physical powers into three classes; to each individual a specific task is assigned, calculated so as to allow a man by actual hard labour to perform half as much again as is allotted to him for his daily task, the non-performance of which subjects him to be put on low diet, confined in a solitary cell, or otherwise punished; but whatever surplus labour be done above the daily task the prisoner gets the credit of it; for instance, a man sentenced to hard labour for three months may earn his release in two months, and continued good conduct tells in diminution of the duration of his punishment. At the end of each month, the whole of the convicts are publicly informed of the amount of their credit for extra labour. Small quantities of tobacco and other petty indulgencies are granted to well-conducted men. As an inducement to learn to read and write, the prisoners are informed that until they can do so, the government will not permit them to enter the second or passholder stage of probation.

The daily routine of duties at the convict stations is very minutely regulated; the following abstract of the rules will indicate the care bestowed:—First bell, at a quarter before five or six, A.M., according to the season, summons the convict to rise, dress, and fold bedding; second bell (fifteen minutes later), to turn out, form on muster-ground, and proceed in messes of ten men each to washing places, under supervision of an officer; at the expiration of another fifteen minutes, third bell,—muster and minute inspection, prayers are read, working parties formed, and marched off to labour under their respective overseers. Eight, A.M., breakfast; quarter to nine, again to work. At noon, dinner; one P.M. again to work, until five P.M. After labour convicts wash as in the morning, then proceed to supper; afterwards, at six P.M. to school in the mess-room, where, in addition to the schoolmaster, an officer and a constable are

on duty. Eight P.M., school-books collected, religious service for the evening read by the chaplain, the men proceed to their wards, are mustered, and prepare to retire to rest, when upon the "silence bell" being rung, and a signal of warning given, the prisoners unite in singing the "Evening Hymn," which closes the day. Perfect silence is then enforced until morning. Constables, and watchmen (furnished with slippers) perambulate the wards during the night, taking care that the lights are kept properly burning, and that the strictest order is maintained; an officer also visits the dormitories during the night, and his reports are recorded in a book kept by the watchman on duty, to be examined in the morning by the superintendent of the station, and by the visiting magistrate. On Saturday evening there is no school, and the prisoners are employed in repairing their clothing, during which time public reading is kept up in each ward. Every individual is furnished with a bible and a prayer-book, and there is a library of instructive and moral books, which are lent to the more deserving. On Sundays there is Divine service in the morning and in the afternoon, and in the evening the whole of the prisoners are formed into school-classes, as on the week days, with monitors, when the Scriptures are read by the convicts, and then explained by the minister. The other details for the preservation of order, of cleanliness, and of punctuality, are admirable, and it would appear to be difficult for the most idle, careless, or indolent, long to resist the beneficial influence of such wholesome and steadily-enforced discipline.

The next stage above the probation gangs comprises the pass-holders, who are protected by regulations enforced by the local government, since September, 1847, which in substance are to the following effect. Their *employers*, who must be authorized by the lieutenant-governor, cannot hire them for less than one month, at such wages as may be agreed upon; must provide suitable lodging and bedding, free of charge, and daily rations of 1 lb. meat, 1½ lb. bread, or 1 lb. bread, and 2 lbs. vegetables; 1 oz. roasted wheat (as a substitute for coffee), or ¼ oz. tea, 1 oz. sugar, ½ oz. soap, and ¼ oz. salt. Wages to be paid monthly or quarterly, but not for periods of misconduct or sickness; the master's rights not to be transferable, but the servant to be returned to the nearest hiring depôt, if his services be

no longer required, or he may be withdrawn in a summary manner by the lieutenant-governor, on a substantiated complaint. As regards the *employed*, no pass-holder can refuse entering an eligible service at reasonable wages, but the engagement is cancelled by his obtaining a ticket-of-leave; he is to be provided with medicines and medical attendance when ill, or sent to a general or station hospital, his employer guaranteeing the payment of one shilling a day; must attend divine service, at least, once in every Sunday, in accordance with his professed creed; cannot be at large or work for his own benefit, and is amenable only to convict law. The stage above that of pass-holders is the ticket-of-leave holder; the nature of the privilege thereby conferred, has been stated in the previous pages, and in the history of New South Wales, p. 414. This boon may be granted for good conduct in prison, and on the public works at home, or in Bermuda, or Gibraltar, so that the convict, on landing in Van Diemen's Island, would at once receive this indulgence; or it may be the result of meritorious conduct in the colony. Conformable to instructions from the Secretary of State, all ticket-of-leave holders arriving in Van Diemen's Island, after the 1st of January, 1849, are required to pay a certain sum towards the cost of their conveyance to the colony. For instance, if under a sentence of seven years, he will be required to have paid £7 10s.; if under a sentence of fifteen years, £11 5s.; and if under a sentence of life, the whole amount of £15, before he can be recommended for a conditional pardon. A fund will thus be provided, by means of which the wives and families of ticket-of-leave holders, of the class above referred to, will be sent out to them, when half the cost of doing so has been paid by themselves, their friends, or their parishes in the United Kingdom. It is, however, doubtful whether it will be found advisable to enforce these payments.

The convict women, on their arrival in Van Diemen's Island, had been, under the previous arrangements, required to pass the first stage of their probation, for six months, on board a hulk, termed the *Anson*, where they were taught needlework, straw plaiting, &c.; but here also the herding together of all grades had been fraught with serious evils; the younger and less depraved being speedily reduced, by their associates, to the same fearful state of demoralization. Prisoners misconducting themselves on board

100 NUMBER AND CLASSIFICATION OF CONVICTS IN V. D. ISLAND.

the *Anson* were ordered to be sent to a female house of correction; and when they had there finished this second or intermediate sentence, they were sent back again to complete the required six months' probation. The *Anson* hulk is, I believe, now abandoned; and the convict women are classified in the Factory, near Hobart Town, which I have before spoken of, as admirably constructed for the purpose.

I now proceed to shew the number, classification, and other facts connected with the convicts in Van Diemen's Island, according to the latest returns transmitted to her Majesty's Secretary of State for the Colonies.

The classification of the convicts in Van Diemen's Island, for 1848, is thus shewn:—

	Males.	Females.	Total.
Ticket-of-leave Holders:			
On their own hands	8,807	1,108	9,915
Under magisterial sentence	186	34	220
In hospitals	104	5	109
Total	9,097	1,147	10,244
Pass-holders:			
In private service	6,878	1,389	8,267
In hiring depots	1,091	197	1,288
Under sentence	1,553	632	2,185
In hospitals	361	61	422
Total	9,883	2,279	12,162
Under probation or sentence:			
Under probation	1,355	478	1,833
In gaols	10	—	10
In hospitals	196	61	257
Under second conviction	292	—	292
Re-convicted men under orders for removal to Norfolk Island	661	—	661
Total	2,514	539	3,053
Total number of Convicts in the colony on the 31st of December, 1848	21,494	3,965	25,459

Note.—There were granted, in 1848, 1,946 certificates of freedom to convicts who had served their sentences; 1,242 absolute and conditional pardons; 3,682 tickets-of-leave, deducting those which were cancelled. The number of convicts who became free in 1848, but who did not apply for certificates of their freedom, was 1,145. Total number of deaths reported, 244.

The actual number of males on probation or under sentence, on the 1st of December, 1848, was—on Tasman's Peninsula, 1,963; Maria Island, 554; Norfolk Island, 661: total, 3,178.

Assuming the average number of pass-holders employed and supported by private individuals is 8,000, and estimating the number of ticket-of-leave holders earning their own subsistence at 9,000, this would give a total of 17,000 convicts maintained without cost to the British treasury.

The different stations, male and female, in Van Diemen's Island, and in Norfolk Island, and the number of Protestants and Roman Catholics at each station and establishment, on the 15th of April, 1848, are shewn in the following table:—

Note.—SUMMARY: Protestant convicts, males, 4,869; females, 624; total, 5,493; religious instructors, 20, or 1 instructor to 274 Protestants. Roman catholic convicts, males, 1,618; females, 449; total, 2,067; religious instructors, including new arrivals, 9, or 1 instructor to 229 Roman catholics.

The free persons employed in the convict department, during the year 1848, were—of the class of educated persons, 141 officers, superintendents, magistrates, &c., 54 chaplains, catechists, and schoolmasters, 29 medical men, and 51 clerks; of the class not required to be educated, 83 tradesmen and seamen, and 218 other free persons; the whole number being 576.

The expenditure in the colony on account of pay of officers, and food and clothing for convicts, was, in 1848, £152,800; and, on account of pay of military guard and staff officers, including rations, in 1848, £91,777.

The estimated consumption, in 1849, of

articles the produce of the colony, deducting the quantities grown at stations, was—meat, 1,696,853 lbs.; salt beef, 264,990; salt pork, 7,166; suet, 60; lard, 1,050; flour, 3,628,316; bread, 575,566; biscuit, 37,960; bran, 6,000; vegetables, 823,921; milk, 174,281 pints; yeast, 2,269 gallons; peas, 9,490 lbs.; straw, 32,175; oil, 13,909 galls.; candles, 9,954 lbs.; wood, 7,665,026;—valued at £37,222.

The attention paid to the instruction of the prisoners may be gathered from the following return, shewing the state of schools at the various convict stations on the 31st December, 1848:—

On the 1st of July, 1846, the number of convicts at large was estimated at 599 males, and 145 females = 744. On the 1st of July, 1848, the numbers were, 480 males, 117 females = 597. This, however, includes all who have absconded since the year 1823, many of whom, it is believed, have made their escape from the colony, some must now be dead, and the term of imprisonment and degradation allotted to others has elapsed.

The careful manner in which the convicts have been conveyed to their place of exile is evidenced by the following parliamentary return, (No. 166, House of Commons, April 4th, 1843):—The number of hired convict ships and transport vessels employed by the Admiralty between 1816 and 1842 inclusive, has been—convict ships, 548; transport vessels, 870. Total, 1,418 ships. *Not one of these vessels foundered at sea; but during the same period fifty-nine ships of war and ten government packets foundered*

at sea, or have not been heard of since. Although there have been many attempts at escape among the convicts during their voyage, I believe the only successful instance was that of a *female* convict-ship, when the seamen co-operated with the prisoners, and navigated the vessel to Valparaiso, where I understand the principal inn is now kept by the woman who planned the mutiny.

In a *financial* point of view the subject is of the first importance; the disbursements for the criminals of the United Kingdom, the cost of military guards, &c., averaging *nearly three thousand guineas every day throughout the year.** The expense to be defrayed from the British Treasury for convict establishments in the colonies for the

* The number of prisoners committed in 1849, was—in England and Wales, 27,816; in Ireland, 41,989; in Scotland, 4,357 = 74,062; the average expense of each committal, reckoned at £14, gives a total of upwards of £1,000,000 sterling.

year ending 31st March, 1851, is estimated at £200,146; of this there is apportioned to Van Diemen's Island (convicts 5,206, and children 675), £125,642; to New South Wales, £7,712; to Western Australia, £11,778; to Bermuda (convicts 1750), £40,670; to Gibraltar, (convicts 910), £14,344. The number of convicts for which this estimate is made at New South Wales and at Western Australia, is not stated; as regards New South Wales, the sum of £7,712 must refer rather to the remnant of the establishments in that former penal colony than to any prisoners now in the service of the crown.

In Van Diemen's Island the estimate for £125,642 includes salaries and allowances for superintendence to the amount of £30,354; police, gaols, and witnesses, £25,000; provisions for healthy convicts and establishment, £21,000; clothing and bedding, £10,000; salaries and allowances for religious instruction, £6,960; salaries and allowances for medical treatment, £8,024; naval stores, repairs of hulks, boats, buildings, and repairs of buildings, £6,416; transport of provisions, £5,907; fuel and light, £4,991; postage, printing, books, &c., £2,000; preventive guard and capture of runaways, £1,250; provisions for sick convicts and establishments, £1,355; special commission to Norfolk island, £500; pensions, £532; sundries, £1,250. Taking the whole number at 5,881 prisoners, the cost for each during the year is £21 7s. In this statement there is no deduction for the earnings of the prisoners.

The cost of the principal prisons where the convicts are confined previous to transportation, according to the parliamentary estimates for the current year, is shown in a tabular form on the next column.

The gross total is £247,250; of this the salaries of chief officers and clerks amounts to £23,786; wages of inferior officers and servants, £35,695; manufacturing departments, £6,979; rations for officers or allowances in lieu, £6,378; diet for prisoners, £79,934; clothing and bedding, £19,654; fuel and light, £8,656; furniture and fittings, £5,779; buildings and hulks, about £45,000; contingencies, about £10,000; medicines and medical comforts, £4,200.

The expense per head for one year, taking the total number of prisoners at 9,828, and the net charge at £237,224 is upwards of £24, which is more than a convict would cost in Van Diemen's Island. The actual

outlay incurred in deporting the prisoners I do not exactly know; that office belongs to the Admiralty department. Estimating that 80,000 convicts have been conveyed from the United Kingdom to New South Wales and Van Diemen's Island, and that the average cost for the whole period has been £30 per head, this gives a sum of £2,400,000. The expense is now possibly from £20 to £25 per head.

Note.—£527 8s. are subtracted on account of house-rent, to be paid by officers provided with residences on the premises. The annual cost per head is an average.

The lieutenant-governor, on whom devolves the twofold duty of administering the affairs of an extensive colony, and carrying into effect the instructions from England relative to 30,000 criminals, must necessarily be entrusted with a large discretionary power: the officer on whom this heavy measure of responsibility now rests, was thus spoken of by Earl Grey, on the 15th of March, 1850, in the Chamber of Peers, when, after rightly claiming credit on behalf of her Majesty's government, for having done the best to meet difficulties of no ordinary description, his lordship added,—“The arrangements made by Sir William Denison cannot fail to be attended with the best effects: in the measures he has adopted we have evidence of full information, sound judgment, an earnest wish to perform all his duties to the utmost, and the presence also, on his part, of strong religious feelings, the influence of which cannot be over-estimated in the management of such a colony as that entrusted to his charge.”

I have now entered as fully as my limits permit, into the past and present state of

penal discipline; on the practical working of the existing system, it would be premature to express a decided opinion; but it is, I fear, only too certain that, under any system, however well devised, and conscientiously carried into execution, transportation or the imprisonment of large bodies of criminals, must inevitably bring with it evils which no human prudence or precaution can prevent. One satisfactory conclusion I have at least arrived at by a careful perusal of the voluminous documents which have been written and printed on this painful subject, and that is with regard to the conduct of the various members of her Majesty's government, of every party, during the last twenty years, who do appear to have sincerely, and to a considerable extent, successfully endeavoured to make "the law a terror to evil-doers," and yet to enable a "wicked man to turn away from his wickedness and live." Whether these desirable ends can more effectively be promoted by solitary confinement in England, subsequent hard labour in probation gangs, and finally by deportation under the designation of "exiles," than by a well-ordered system of assignment, remains to be proved.

But, whatever system may be deemed preferable, the transportation of criminals is a positive duty to society, and the best means of rescuing the misguided beings themselves from a career of infamy. By such expatriation, former habits are broken, early associations altered, a new scene is opened to view, where labour is in demand, where independence may be obtained, and the stain on tarnished character, to a great extent obliterated, by a career of honest industry and honourable conduct. There are now in Australia about 50,000 *free persons*, some of them living in opulence, most of them in comfortable circumstances, who arrived there as convicted felons. It is fair to presume that all, or nearly all of these 50,000 adults are, to a greater or less extent, reformed characters, otherwise the state of society which I have described in my volume on New South Wales, and in the present book, could not exist. What would, however, have been the condition of these 50,000 persons, if after confinement in a gaol or in hulks in England, Ireland, or Scotland, they had returned to the contaminating haunts of their former evil deeds? to the pernicious influences of those who had for a time escaped the meshes of the law, or the gripe of the police officer? What, it may further

be asked, would be the extent of increased pollution they would bring to the associates to whom they returned, reeking with the concentrated vice, and branded with the damning infamy of a gaol?

In France, the evil resulting from the want of a system of transportation has become of alarming magnitude; the *forçats* have corrupted thousands, who would otherwise probably have never been made acquainted with vice; each disbanded or discharged convict becoming the centre of a circle composed of the idle, thoughtless, and evil-disposed; socialism, red-republicanism, and other destructive principles become familiarized to the multitude; unceasing efforts are made for the overthrow of order, and a disturbing influence is ever at work: those who have completed their servitude in the chain-gangs and galleys of Brest, Cherbourg, Toulon, &c., constructing fortresses against external foes, occupying themselves far more actively in multiplying internal enemies, who, unless checked in their career, must, sooner or later, vitiate the body politic, and overthrow the institutions of the state.

But it is not only in France that this serious evil is attaining an alarming height; in Vienna, in Rome, in Berlin, in New York, New Orleans, and Philadelphia—in all the large cities of continental Europe and America, statesmen and moralists know there are regularly-organized masses living on plunder and in vice—whose operations are ordinarily carried on in isolation and darkness; but who, on the outbreak of any popular tumult, combine their demoniac efforts, appear in open day in the public thoroughfares, and horrify peaceable citizens with their barbarian aspect—their ruffianly proceedings, and savage deeds. Such were the wretches who committed the recent cowardly murders at Frankfort, at Vienna, and at Rome—such the diabolical agents of Robespierre and Marat; and they have left the traces of their crimes on nearly every capital in Europe. England has, however, not only avoided the injurious consequences of criminals returning into society, and corrupting it to the core, but has converted an apparently unmixed evil into the source of positive good.

During the debate in the House of Lords on the *Convict Prisons Bill*, 13th April, 1850, Earl Grey, when speaking of the beneficial effect of transportation, both as regards the removal of criminals from this had passed through the sentence of trans-

portation, and were now honestly earning their own subsistence in the Australian colonies," emphatically exclaimed—"But in the memory of men now alive, what a nation has been created! And was it not the creation of a system of transportation? (hear, hear.) By no other means could they have formed, in so short a space of time, infant communities of equal prosperity and magnitude. It might be said, that South Australia and Port Phillip were not indebted to the convict system; but that was a mistake: for those places could not have risen to anything like their present importance, but for the neighbourhood of the convict colonies." (Hear.) Lord John Russell, also, in his minute on convict discipline, of January, 1839, quotes a French author who, dilating on the peculiar origin of the penal colonies in Australia, says—"Never was there a more conspicuous example of the omnipotence of laws and institutions over the character of individuals: to convert the most hardened villains—the most daring robbers into honest and peaceable citizens, or industrious agriculturists; then to operate the like revolution in the vilest prostitutes—to change them, by infallible means, to faithful wives and excellent mothers. Next, to watch over the rising population; to preserve them, by the most assiduous care, from the contagion of their parents; and thus breed up a generation more virtuous than the race from which it sprang. Such is the impressive picture which the English colonies in Australia present."

Whether any more convicts be sent to Van Diemen's Island will probably depend on the number of prisoners sentenced to transportation, and to the impossibility of providing for them in Western Australia, or in other colonies. It was the wish of her Majesty's government to send prisoners who have passed through the stages of solitary confinement and hard work, to the Cape of Good Hope and New South Wales. The colonists, however, objected to receive them; and Earl Grey says, in his speech of 15th March, 1850—"Her Majesty's ministers did not think themselves at liberty to overrule that reluctance in colonies which were not founded as convict settlements; and as a pledge had been given, in 1840, that New South Wales should be treated as a free colony, and many free persons had gone there since that period, it would be scarcely fair to re-establish it again as a penal colony." With regard to Van Diemen's Island, to

which the free inhabitants have gone with their eyes open, her Majesty's government declare that the British public has a right to consider it as a colony fitted to receive convicts sentenced to transportation; but should any more be sent thither, "the practice shall be continued with the least possible loss, injury, or expense to the colony." Of late years, the local revenues were expected to contribute 6*d.* a day towards the support of each convict employed on public works; the colonists were unable to do so. Now, no more is asked than payment for the tools used, and for the superintendence; by which means several great lines of roads have been opened, and other useful objects carried into effect.

The principal works in the colony have been constructed by the labour of convicts: Among these may be included government-house, barracks, forts, commissariat stores, wharfs, churches, school-houses, gaols, police offices, roads, causeways, and bridges. These unproductive works have not resulted from the capital of the free immigrants, few of whom, on their landing, had much beyond the means of existence for a limited period: they have been created by an annual expenditure averaging about £100,000 for the last thirty years—say three million sterling—and by an abundance of cheap convict labour.

I cannot better conclude the description of this colony, than by the expression of the hearty respect and sympathy which, I believe, the free inhabitants of Van Diemen's Island deserve from their fellow-citizens in the United Kingdom. Their numerous and well-attended places of worship, and their societies for the promotion of christian knowledge, attest the importance attached by them to the promulgation of religion, and the due observance of its holy ordinances; their public and private academies evidence as forcibly their strong and almost universal desire, as parents, to bestow on their children a sound English education; these, together with their hospitals and other charitable institutions, their libraries, literary and scientific societies, their mechanics' institutes and lecture halls, supported as they are by a free population, including women and children, of less than fifty thousand, do indeed prove, in the emphatic words of the address to Earl Grey, read at the Launceston public meeting, December, 1849, "*that as a community, they are patriotic and enterprising, earnest and energetic, industrious and self-denying.*"

HIS GRACE, THE DUKE OF BEDFORD.

BOOK II.—NORFOLK ISLAND.

POSITION, AREA, ASPECT, OCCUPATION AND DEGREE OF CULTIVATION, AND CONDITION AS A PENAL SETTLEMENT.

NORFOLK ISLAND, in 29° S. lat., 168° E. long., was discovered by Cook during his second voyage, at daybreak, on the 10th of October, 1774, and received from him its present name in honour of the noble family of Howard. Cook landed on the same day, and says, "we found it uninhabited, and were undoubtedly the first that ever set foot on it." About two hundred yards from the shore the ground was covered so thick with shrubs and plants as hardly to be penetrated further inland by the explorers; and after noting the magnificent pine, which, he says, differed somewhat from that which grows in New Zealand and in New Caledonia,—and remarking that many trees, plants, and birds on the island were similar to those on New Zealand, Cook sailed on the ensuing morning to the southward.

The island, is about seven miles long by three to four miles broad. The superficies are estimated at 8,960 acres, of which 1,080 acres are cleared for agricultural purposes, and about 1,000 acres for pasturage.

The surface resembles the sea during a gale of wind, being composed of long, narrow, and very steep ranges of hills, with deep gulches, which are in most places extremely narrow. The coast is nearly everywhere iron-bound, and landing is frequently dangerous. *Anson's Bay*, on the west, and *Bull's Bay*, on the east, afford some protection when the winds are not blowing in that direction.

Mount Pitt, 1,200 feet above the sea, on the northern side, is the highest eminence in the island, and from its summit every valley and farm may be viewed as if delineated on a map. The majestic Norfolk Island pine with its sombre foliage, the fern-tree with its softer green, the orange and lemon groves, and numerous graceful trees and flowering shrubs entwined with parasitic plants of extreme beauty, are scattered over the varied surface, appearing yet more lovely from the contrast they afford to the high and rugged

shores against which the thundering surf of the Pacific rolls unceasingly.

There is an excellent road across the island from the landing place, called the Cascade, to the principal station. The road is carried along a very narrow slip of table-land or ridge, in nearly a straight line, and on either side there are occasional glimpses of beautiful scenery. At the edge of this slip of table-land a steep and tortuous road, with a descent of about 200 feet, leads to the settlement; on the left are the new barracks, consisting of one square building, two stories high, with a verandah on the ground-floor; contiguous to this there is a detached building of the same height, with verandahs to both stories—it is used as an hospital; on the right is a similar building for the officers' quarters and mess room; the whole surrounded by a wall flanked with towers at the corners, and loop-holed for musquetry. Close by is the parade-ground, a fine piece of turf, three acres in extent, with a narrow valley at the back, watered by an ever-flowing rivulet; where the productive gardens of the soldiers and of civil and military officers are situated. The residences of the civil officers and staff, consist of a succession of white cottages of one story, surrounded with green verandahs, each on its own lawn or shrubbery, ornamented with variegated flowers, one above the other, about twenty yards apart, and presenting a very picturesque view. The government-house, a comfortable structure, is built on a mound at some distance from the road-side opposite the old barracks. The farms are scattered in different parts of the island, wherever the land is available for cultivation.

Nepean Island, a bald-faced rock near the south-eastern part of Norfolk Island, and *Phillip Island*, another desolate rock, constitute the only objects within sight.

GEOLOGY.—A small portion of the south side is limestone; to the east of this there is a still smaller portion of coarse siliceous

sandstone; the remainder of the island is basaltic. The *soil* is generally good.

Vegetation.—When we first occupied the island, it was entirely covered with fine trees; Captain Hunter, R.N., mentions some pines 150 to 200 feet high, 28 to 30 feet in circumference, free from branches 40 to 60 feet above the ground, and “with a very noble appearance.” J. Backhouse, who visited it on a Christian mission in 1835, describes the upper portions of the valleys and the higher parts of the hills, being then covered with wood. The Norfolk Island pine (*Altingia excelsa*) towers 100 feet above the rest of the forest; it also grows in clumps, and singly on the grassy parts of the island, to the very verge of the sea, where its roots are washed by the high tides. In figure this fine tree resembles the Norway spruce, but the tiers of its branches are more distant. A remarkable fern-tree (*Alsophila excelsa*), forming a striking object in the landscape, is found near some water-courses with a trunk 50 feet in height, and fronds 7 to 12 feet in length. A *pandanea*, or screw pine, called Norfolk Island grass-tree, is another remarkable production; its stem is marked by rings, where the old leaves have fallen off, and is an inch and-a-half in diameter; it lies on the ground, climbs like ivy, or winds round the trunks of trees. The branches are crowned with crests of broad sedge-like leaves. From the centre of these arise clusters of three or four oblong red, pulpy fruit, four inches in length, and as much in circumference. While the plant is in flower the leaves are scarlet, and when twined round the splendid fern-tree, the effect is very gorgeous. The thick forest is overrun with luxuriant climbers, among them a wisteria, with pea flowers of purple and green, hangs in festoons of twenty to thirty feet in length; and the *Ipomicea pendula*, with its fingered foliage and rosy pink flowers, climbs from tree to tree. The Norfolk Island cabbage-tree attains a height of twenty feet. The New Zealand flax abounds. The apple-fruited guava and the lemon, have overrun the island; oranges, grapes, figs, olives, pomegranates, strawberries, loquats, melons, and bananas, are cultivated successfully. The *climate* is

salubrious, but too warm to admit of the labour of Europeans at mid-day in the open air, during the summer months. This is an objection to the place as a penal settlement.

The island was occupied in 1790 by the government of New South Wales (see previous vol., p. 404), as a place where food might be cultivated for the then famishing colony at Sydney. Several convicts and some free settlers were sent to the place, who declared it to be inadequate even for the maintenance of its own population, and the settlers and prisoners were removed to Van Diemen's Island, where they formed the township of New Norfolk. During the administration of General Darling, the island was re-occupied as a place of punishment and safe-keeping for desperate offenders, and for persons convicted in New South Wales; and it has since remained as a receptacle for the worst class of offenders—men of desperate and almost irreclaimable character, who on several occasions have mutinied and murdered their overseers.* On these and other painful and revolting subjects, it is not my intention to dilate.

The buildings on the island in March, 1848, were a new gaol, prisoners' barracks, enclosed lumber yard, with mess-room, convict hospital, old and new military barracks, commissariat stores, civil officers' quarters, detached workshops, stores, and a protestant and Roman catholic chapels. In the new gaol there are 124 cells; viz., eighty-two, 6 feet by 5; two, 6 by 12, and forty, 8 by 6; height, 10 feet, 9 inches. The prisoners' barracks consist of a three-story stone building, with a centre and two wings, with ample accommodation for 700 prisoners. The military barracks, an excellent building completely protected against any attack from the convicts, has quarters for 200 men.

Sir William Denison states that there are nearly 9,000 acres of excellent land in the island; if so, there would appear to have been mismanagement in its not having been cultivated for the support of the numerous convicts, who have from time to time been stationed there. There are 1,200 acres of arable land, cleared, and 4,000 more might be profitably brought under cultivation; but, on the 30th of June, 1848, the whole extent producing crops was 8 acres, employed in the

* In July, 1846, the prisoners during a mutiny murdered and wounded several overseers. For this offence twelve of the convicts were executed on the 13th of October, 1846, after a trial which lasted eight days; two more were subsequently executed.

I can find no return of prisoners executed at Norfolk Island for a series of years; such a statement would be useful; I am however of opinion, that the extreme penalty of the law is not often inflicted in Norfolk Island.

growth of *arrow-root*; hospital garden, 3 acres; sweet potatoes, 65 acres; fallow land, 20 acres; oats, 46 acres; barley, 22 acres; rye 10 acres. Total, 174 acres. Five acres were then preparing for tobacco, and 84 had English grasses, making only 263 acres of ground broken up after more than twenty years' constant occupation. Maize, when the crop succeeds, has been grown to the extent of sufficient for the supply of 700 men for three months. In October, 1848, there were 190 working oxen, 68 horses, and about 507 pigs, of which 300 were sows. There is an abundance of good water.

It has been proposed several times to remove all the convicts from Norfolk Island, on account of the immoralities produced by congregating together a large number of prisoners; but a better system of discipline having now been enforced, Earl Grey signified to the lieutenant-governor of Van Diemen's Island, on the 4th of December, 1849, that her Majesty's government had determined on retaining Norfolk Island as a place of punishment for those prisoners who prove incorrigible in the hulks and in gaol, as experience had shewn it to be indispensable to have some ulterior plan of punishment for such desperate offenders as defy all authority, and endanger both the lives of their officers and the peace of the establishments in which they are detained. Her Majesty's government were well aware of the evils connected with the settlement, some of which were of an adventitious character, and have since been remedied,* but the advantages of the

* Dr. Hampton, comptroller-general of convicts in Van Diemen's Island, was sent to Norfolk Island, to report specially on its condition, and the advisability of retaining it as an *ultra*-penal settlement. The opinion of this able officer, dated the 10th of March, 1848, is decidedly in favour of keeping this place, as the severest punishment, short of death, for any criminal. Great and much-needed reforms had been made previous to the arrival of the comptroller-general: each of the chain-gang was lodged in a roomy, secure, well-ventilated, stone cell; and 328 convicts could each be locked up in a separate apartment at night. The spiritual instruction was improved, by the substitution of more efficient Protestant and Roman Catholic ministers; and an efficient commandant had checked the open vice and insubordination resulting from previous lax discipline. The results of this beneficial change are thus shewn in the report of Dr. Hampton:—

"It is only the restraining influence of strict discipline, aided by separate cells, want of confidence in each other, and the dread they all evidently feel of the present commandant's thorough knowledge of convict habits and character, which render men

place for restraining a limited number (500 to 700) of the worst offenders, who dread the idea of being sent thither, are stated by her Majesty's government, to be its remote and lonely situation, at a distance from any inhabited land, by which all hope of escape is cut off; the cultivation of the soil (about 9,000 acres) in a salubrious climate, affording eligible employment for the convicts, thus effectually precluding the formidable crimes which are liable to be committed by bush-rangers and runaways in Australia, or in Van Diemen's Island. The policy carried out partially by Captain Maconochie, of enabling a prisoner to work out his period of servitude, which should be for an unlimited period, by earning a certain number of good marks individually, or in gangs of six or more persons, has been abandoned, and a more rigid coercion is now enforced. It is to be hoped that by an attention to the spiritual improvement of the prisoners, and by actively employing them in the cultivation of the soil, a reform may be looked for even among the worst characters transported for life to this secluded island.

The administration of affairs is confided to the Lieutenant-governor of Van Diemen's Island; the prisoners are under the supervision of the Comptroller-general of convicts at Hobart Town; the military guard is provided by the regiment stationed in the Tasmanian command; and the expenditure is annually voted by the Imperial Parliament, under the head of *convict services*.

quiet, orderly, and obedient, who were formerly insolent, turbulent, and violent in the highest degree. But it is an important step in advance, to have been able, with such a class of convicts, to enforce subordination, and outward decency of conduct and language; and, if this is properly followed up, much more satisfactory results may yet be produced.

"Crimes of magnitude, and even trifling breaches of discipline, are now very rarely committed; and I may here observe, the magisterial records shew that issuing tobacco to the prisoners has, in a most striking manner, lessened the amount of petty offences, and otherwise caused very beneficial effects.

"The prisoners in general looked healthy and robust; and although they must now be much more comfortable than under the former relaxed state of discipline, nearly all with whom I conversed expressed such an extreme anxiety to be removed from the island, that they evidently feel more than the usual longing for change so prevalent amongst convicts everywhere, and attributable at Norfolk Island, I have no doubt, to the complete isolation, the hopelessness of escape, the nature of their food, and the strict discipline to which they are subjected."

BOOK III.—NEW ZEALAND.

CHAPTER I.

DISCOVERY AND HISTORY.

By whom—in what manner—and at what period, the group of islands known to us as New Zealand were originally discovered and occupied, are questions which have given rise to various conjectures and ingenious theories, founded chiefly on the personal appearance, language, and customs of the race or races by whom they were inhabited when first visited by Europeans. The account given by these people amounts to little more than that their ancestors, whom some of the chiefs are said to be able to trace back for sixteen generations, fled thither, in canoes, from an island called Hawiki (probably Hawaii, or Owhyhee, one of the Sandwich Islands), in consequence of having been defeated by another tribe with which they were at war, bringing with them their dogs, the kumera, or sweet potato, and a root called taro, the two last being their chief articles of food.

Among European* navigators, the claims of De Gonville to the discovery of New Zealand, are asserted by the French; while some writers uphold those of Juan Fernandez. This question is, however, of little importance, since it is generally acknowledged, that the first authentic information made public concerning it, was derived from the famous voyage of discovery undertaken by Tasman, in 1642, by the direction of the Dutch East India Company. From the journal kept by him during the expedition, we learn, that he left Van Diemen's Land (see p. 1, Div. v.) on the 5th of December, 1642, purposing to sail "precisely eastward," in the hope of making further discoveries. On the 13th, land was seen, bearing south-south-east; next day, the vessels anchored

two miles off the shore; on the following, proceeded along the coast to the northward; and at sunset on the 18th, anchored in a bay at the entrance of the strait which divides the northern from the middle island. Tasman would probably have discovered the strait, especially as he was desirous of making his way to the opposite coast, had he not been deterred from pursuing his explorations in this locality by foul weather, and likewise by the hostility evinced by the natives, which, according to Tasman, was totally unprovoked. From his statement, it would appear, that seeing "the savages venturing on board the *Heemskerk*, to trade with that vessel, and fearing they might attempt to take it by surprise, he sent seven men in a shallop, from his own ship, the *Zeechaan*, to put the people in the *Heemskerk* upon their guard." The boat was intercepted by the natives, and its crew being unarmed, three of them were killed, and the other four forced to swim for their lives. The canoes then paddled swiftly to the shore, escaping the fire immediately opened upon them by the Dutch, who were prevented from pursuing them, and taking a "severe revenge," by a very strong west wind. Tasman termed the scene of this disaster *Murderers' (Moordenaers) Bay*, (Massacre Bay, in the map); and proceeded thence along the western coast, until he reached the low, bleak promontory constituting the northern extremity of New Zealand, to which he gave the name of her whom he delighted to honour, *Maria Van Diemen*.

After sailing round a small island, called the *Three Kings* (to the north-west of Cape Maria), Tasman, on the 6th of January, shores are laid down in Spanish charts of a date previous to the explorations of Cook; the other, that some of the New Zealanders declare that their forefathers did not bring the dog with them, but that it was introduced from a ship which visited their shores. This tradition is corroborated by the name frequently applied by them to that animal, being the identical word used by the Spanish (*perro*), and having evidently no connection with the Maori language.

* I have had occasion, in a previous portion of this work (Div. iii., p. 363) to advert to the geographical knowledge which there appears reason to suppose must have been acquired by the early Portuguese, Spanish, and Dutch navigators, but which the narrow and selfish policy of their respective governments prevented them from making public. This opinion is supported by two striking facts connected with New Zealand, one of which is the correctness with which Dusky Bay and other portions of the south-west

1643, quitted New Zealand, having "never set foot on its shores," and returned to Batavia.* In communicating the results of his expedition, he speaks of the land which he had discovered as being probably a portion of the *Great Southern Continent*, whose existence was then a prevailing opinion among geographers, and a small portion of whose extensive outline Le Maire and Schouten were supposed to have sighted in 1614. Believing, therefore, the shores explored during his recent voyage to adjoin the coast previously described, and called *Staaten Land*, Tasman applied the same name to his own discovery; but a few months after his return, Heindric Brouwer, having ascertained that the *Staaten Land* of Le Maire and Schouten was merely an island of inconsiderable size, (off *Terra del Fuego*), the designation of *Nova Zeelandia* was given to the new-found and more important territory;—a singular choice, considering the contrast presented by its high and rugged surface, to the low, swampy flats of its European namesake.

Tasman did not revisit New Zealand; and, from the date of his voyage to that performed by our illustrious circumnavigator in 1769, no account exists of any vessel having sighted its shores, although there appears reason to believe that a European ship touched on the western coast no long time before the first visit of Captain Cook, who himself alludes to the statements made to him on the subject by the islanders. New Zealand continued to be viewed as part of the Great South Land, during the long interval of 127 years before alluded to, towards the close of which a new era commenced in the history of English maritime discovery.

George III. succeeded to the throne of Great Britain in 1760, and speedily manifested a strong desire for the acquisition of geographical and scientific knowledge. The voyages of Byron, and of Wallis and Carteret, were undertaken under the immediate auspices of the king, and the discoveries made by them when sailing homeward from the South Pacific, through the strait of Magellan, and across the Pacific Ocean, out of the track of former voyagers, strongly stimulated the public curiosity respecting the *Terra Australis Incognita*. At this time, an

expedition was projected for the purpose of noting a phenomenon of great importance to navigation, which it was confidently hoped would answer the double object of solving a geographical, as well as astronomical problem.

In 1767, the Royal Society resolved that it would be proper to send duly qualified persons into some part of the South Sea, to observe the transit of the planet Venus over the sun's disk, which it was calculated would happen in the year 1769; but having no means of defraying the expenses of such an expedition, they communicated their resolution to his Majesty, requesting his aid in carrying it into execution. The King immediately directed that a vessel should be fitted out, and a strong barge of 370 tons was selected, which being built for a collier, possessed the necessary qualifications for the present undertaking, of strength, roomy stowage, and an adaptation for safely taking the ground. She was named the *Endeavour*, and the command of her given to Lieutenant Cook, who was considered, with good reason, to be specially qualified for the service, having previously distinguished himself in Canada, and while engaged in surveying the coast of Newfoundland.

The island of Otaheite, or more properly Tahiti, which had recently been discovered by Captain Wallis, and called by him George the Third's Island, was deemed the fittest place for the observation. On its conclusion, Cook was instructed to explore the South Pacific Ocean as far as 40° lat., and if he found no land, to proceed westward between 40° and 35°, until he fell in with New Zealand, which he was directed to examine. Mr. C. Green, assistant to Dr. Bradley at the Royal Observatory, was associated with Lieutenant Cook to observe the transit. Mr. (afterwards Sir Joseph) Banks, then a young man, devoting an ample fortune and considerable talent to the scientific pursuits, which through life he so assiduously followed, and Dr. Solander, a pupil of Linnæus, accompanied the expedition, which, exclusive of the above-named, comprised eighty-four individuals, namely, two lieutenants, a master and boatswain, with each two mates; a surgeon and carpenter, with each one mate; a gunner, a cook, a clerk and steward, two quarter-masters, an armourer, a sail-maker, three midshipmen, forty-one able seamen, twelve marines, and nine servants. The *Endeavour* was victualled for eighteen months, and

* The chart of Tasman's route is to be found in Thevenot's Voyages, 1696, entitled *Route d'Abel Tasman autour de la Terre Australe, avec le Découverte de la Terre Australe et de la Terre de Van Dieman*. Tome ii.

provided with ten carriage and twelve swivel guns.

Cook sailed from Plymouth on the 26th of August, 1768; on the 14th of November he anchored in the harbour of Rio de Janeiro, where he met with but an inhospitable reception from the viceroy of the King of Portugal, to whom our navigator essayed to explain the scientific object of his mission, but in vain, for of the transit of the planet Venus, his excellency could form no other conception, than that it was the passing of the north star through the south pole,* and could not be persuaded, but that some scheme of illicit trading was the true cause of a voyage for which so unintelligible a pretext was adduced. The viceroy, however, suffered Cook to purchase provisions for the ship, on condition of one of his own people being employed as factor.

On the 11th of January, 1769, the *Endeavour* passed Falkland's Islands, and sighted the coast of Terra del Fuego; on the 14th she entered the Strait of Le Maire, (see map of Falkland Islands, in sixth Division), and on the 13th of April, anchored at Tahiti. An observatory, with a small fort for its protection, was erected on the shore, in $17^{\circ}29'15''$ S. lat., $149^{\circ}32'30''$ W. long., and on the 3rd of June, the whole passage of the planet over the sun's disk was observed to great advantage, the sky being cloudless from sun-rise to sun-set. The first appearance of Venus on the sun was perceived at 9h. 25m. 42s. A.M., and at 3h. 32m. 10s. P.M., the planet had completed its long looked-for transit.

This primary duty being satisfactorily accomplished, Cook proceeded to carry out the remainder of his instructions. After leaving Tahiti he discovered the Society Islands and Oheteroa (see map of Polynesia), and then sailed to the southward. On the 6th of October, land was seen from the mast-head, and the following day, four or five ranges of hills rising one over the other, with a chain of mountains above all, which appeared of immense height, were distinctly perceptible. The newly reached shores, which the general opinion on board pronounced to appertain to the long looked-for southern continent, were those of New Zealand; Cook having made land about midway on the eastern coast of the northern island, along whose western coast Tasman had sailed in 1642.

On the 8th of October, at four P.M., Cook

* Cook's First Voyage, p. 11.

cast anchor in the Bay of Turanga before the entrance of a small river ($38^{\circ}42'$ S. lat., $181^{\circ}36'$ W. long.), and in the evening went on shore, accompanied by Mr. Banks, Dr. Solander, and a party of men. The natives who had assembled on the bank of the river, ran away on seeing them land. Cook and his companions were, nevertheless, proceeding towards some huts erected near the water-side, when four men, armed with long lances rushed out of the woods to attack the boats. The coxswain, who had been left in charge, fired two muskets over their heads, but finding this did not deter them, he shot the foremost through the heart. His three companions stood for some minutes motionless, as if petrified with horror; then retreated, dragging after them the dead body, which, however, they soon abandoned, finding it greatly incumbent their flight.

On the following morning Captain Cook again landed, accompanied by a Tahitian named Tupia, who addressed the assembled natives in his own language (which was perfectly intelligible to them), offering iron and beads in exchange for provisions and water. The New Zealanders appeared quite willing to trade, provided they could do so profitably, but caring very little for beads, and being unable to comprehend the uses of iron, they steadfastly refused to give anything in return for either article, except a few feathers. They were, however, very desirous to exchange weapons with their new acquaintances, which being, of course, refused, they endeavoured to seize upon them by force. The hanger of Mr. Green was snatched from him by a native, who drew back, waving it above his head exultingly, the rest became extremely insolent, and others were seen coming to join from the opposite side of the river. Mr. Banks fired at the man who had taken the hanger with small shot; but though wounded, he still continued to retreat, upon which Mr. Monkhouse took aim with ball, and killed him on the spot. Upon this the natives, of whom the main body had retired to a rock in the middle of the river, again approached, but on being fired upon with small shot, by which two or three of them were wounded, they swam to the shore, and retreated slowly up the country.

The English re-embarked and proceeded in three boats round the head of the bay in search of fresh water, that of the river being salt. It was while thus engaged that the distressing transaction occurred which af-

fixed so deep a stain on the fair fame of our illustrious circumnavigator, who has himself described the circumstances of the affair.

Two canoes were seen coming in from seaward, one under sail, the other worked with paddles. Cook "thought this a good opportunity to get some of the natives into his possession," and resolved to intercept the canoes, one of which perceiving his intention, made for the nearest point of land and so escaped; the other sailed on, without discerning it, till she was in the midst of the English boats. Nothing daunted, however, on discovering their position, the natives on board of her instantly struck their sail, and commenced paddling so briskly that she outran the boat, Tupia meanwhile calling out to them to come alongside, and assuring them they would receive no hurt.

"They chose, however," says Cook, "rather to trust to their paddles than our promises, and continued to make from us with all their power. I then ordered a musket to be fired over their heads, as the least exceptional expedient, hoping it would either make them surrender or leap into the water." The natives, seven in number, did neither, but immediately stripped, as is their custom when preparing to fight, and on their assailants coming up with them, they defended themselves so vigorously with their paddles, and with stones and other offensive weapons, that according to Cook, the English "were obliged to fire upon them. Four were killed, and the other three, who were boys, instantly leaped into the water." The eldest, who appeared about nineteen years of age, swam strongly, and was with difficulty overpowered; the other two, of whom the younger was about eleven years old, were more easily captured. Once in the boat, every endeavour was made to soothe them; they were loaded with presents of food and clothing, and the next day put on shore.

The conduct of Cook in first endeavouring to seize by force seven unoffending natives, and then because they bravely resisted his unlawful attempt, ordering his men to fire upon them, thereby rendering himself guilty of the death of four of his fellow-creatures, admits no palliation. In commenting upon this painful subject, he says, "I am conscious that the feeling of every reader of humanity will censure me for having fired upon these unhappy people; and it is impossible that upon a calm

reflection I should approve it myself. They certainly did not deserve death for not choosing to confide in my promises, or not consenting to come on board my boat, even if they had apprehended no danger; but the *nature of my service required me* to obtain a knowledge of the country, which I could no otherwise effect than by forcing my way into it in a hostile manner, or gaining admission through the confidence and goodwill of the people." He further adds in extenuation, that though in the contest, "which he had *not the least reason* to expect, the victory might have been complete without *so great an expense of life*, yet in such situations when the command to fire has been given, *no man can restrain its excess, or prescribe its effect*." Surely the most zealous advocate of universal peace could scarcely utter in its behalf language more forcible than these last few words! yet it is evident from the preceding sentence that Cook but faintly understood the twofold guilt that man incurs who sheds innocent blood in a quarrel he has himself provoked. I have dwelt on this distressing incident, not simply on account of its marked bearing upon our early intercourse with the New Zealanders, but because, however harsh it may seem to many, I cannot avoid viewing the subsequent fate of Cook at Owhyhee as a striking fulfilment of the divine decree, that "whoso sheddeth man's blood by man shall his blood be shed." I know the danger of rashly interpreting the ways of God to man, but there are cases, and I believe this to be one of them, which offer warnings that ought not to be overlooked, and cannot be misunderstood.

To resume the narrative, Cook, after landing the three poor youths, left the scene or their misfortunes, which he named *Poverty Bay* (see Map), and sailed to the southward; on the following day, as the vessel lay becalmed, a canoe came fearlessly alongside, containing among others one of the people whom the English had seen during their first visit to the shore. The desire of trading conquered alike the fears and revengeful feeling of the natives—seven other canoes speedily approached, and a friendly traffic commenced. At Cape Kidnapper another unhappy affray occurred; the natives, while trading with the ship's crew, suddenly attempted to carry off Tupia's son, probably supposing him to be a New Zealand child. Cook fired on them, and killed several, before the boy, (who

leaped out of the canoe) was recovered. After sailing as far south as $40^{\circ} 34'$, in long. $182^{\circ} 55'$ west, eighteen leagues S.S.W. from Cape Kidnapper, called by Cook *Cape Turnagain*, he changed his direction and sailed to the northward, touching at various points along the coast, and holding amicable communication with the natives, who were found engaged in the cultivation of the kumera or sweet potato, the cocco or edda (well known in the East and West Indies), and some gourds, in ground well broken, evenly tilled, and neatly fenced in.

At *Mercury Bay*, Cook landed to observe the transit of the planet Mercury, and took possession of the country in the name of his sovereign, a ceremony which he repeated in *Queen Charlotte's Sound*, and several other places; then rounding North Cape, he proceeded down the east coast, saw *Taranaki*, which he named *Mount Egmont*, and sailing through the strait since distinguished by his name, demonstrated the insularity of the northern portion of New Zealand. He then followed down the eastern coasts of the Middle and Southern islands, without however discovering the channel by which they are separated, turned South Cape, and traced the opposite shores back to Cook's Strait. Giving to the north-west extremity of Middle Island the name of *Cape Farewell*, he took his departure from thence on the 31st of March, 1770, resolving—since the season of the year and the character of his vessel forbade his attempting to return to England by Cape Horn, and so finally determine whether there was or was not a southern continent—to steer westward, and visit the Australian coast on his homeward route. (See Div. iii. p. 366.)

He afterwards remarks, that this voyage had swept away at least three-fourths of the positions upon which the notion of its existence was founded, having demonstrated that the land seen by "Tasman, Juan Fernandez, Hermite, the commander of a Dutch squadron, Quiros, and Roggewein, and supposed to be part of a continent, was not so, and likewise refuted the theoretical arguments which asserted the necessity of their being a continent of sufficient size to preserve an equilibrium between the two hemispheres; for upon that principle the extent proved to be water would render the southern hemisphere too light."

While the *Endeavour* was engaged in tracing the northern coasts of New Zealand, a singular coincidence occurred, the same

inlet being sighted in the same day by two vessels, each unconscious of the vicinity of the other.

Doubtless, or Lauriston Bay, received its former appellation from Cook, who passed it on the morning of the 12th of December, 1769; the latter was given to it by M. de Surville, who in the evening arrived off these shores in command of the *St. Jean Baptiste*, a French vessel, which had sailed from India in March, 1769, in search of a marvellous island abounding in gold, which it was rumoured the English had discovered, situated some seven hundred leagues from the southern point of America.

The French were well received by the islanders, and a boat containing the invalids of De Surville's crew being prevented by a violent gale from rejoining their vessel, and detained on shore two days, the men treated with much hospitality by Naginui the chief of the district, who on their leaving would accept of no remuneration. De Surville returned this kindness by the most base ingratitude, for, enraged by the loss of a small boat which he had missed during the storm, and suspecting the natives of having stolen it, he treacherously invited Naginui on board, and made him a prisoner. He then burned to the ground the village in which his men had found shelter in their need, weighed anchor, and sailed for South America, bearing with him the unhappy chief, who pined away, and died after three months' captivity. His persecutor survived him only twelve days, meeting his death in a hasty attempt to land at Callao, the port of Peru, during the flood-tide.* Crime in all ages and among all nations begets crime. Even among Christian communities the retaliation, not the forgiveness of injuries, would seem to be the leading principle of action. What wonder, then, that these poor New Zealanders, who had never heard that vengeance belongeth unto the Lord, should, while standing beside the ashes of their desolated homes, or gazing, heart-sick, on the moving prison into which their chief had been inveigled, have felt their spirits stirred with an intense desire to avenge in blood his wrongs and theirs; not, it is true, on the head of the guilty author of all this misery, for he was already far beyond their reach, but on the first of his tribe who should come within it. They well knew that the Europeans possessed weapons com-

* See *Voyages aux Indes Orientales*. Tom. iii. Par l'Abbé Rochon.

pared with which their stone hatchets and wooden lances, were as the toys of children; open warfare it would consequently be madness to wage; in their turn, therefore, they must follow the example of treachery and ingratitude they had just received—inspire confidence,—and betray it, as theirs had been betrayed.

An opportunity for putting their cruel resolve in execution occurred while the atrocities that had provoked it were yet fresh in their remembrance.

Captain Marion du Fresne, the unhappy results of whose visit to Van Diemen's Island have been related, reached the western shores of New Zealand in March, 1772, and after doubling Cape Maria Van Diemen, sailed past Lauriston Bay, and anchored in the Bay of Islands. The natives came alongside in their canoes, and having been with much persuasion induced to go on board, they ate the food and accepted the presents offered to them, appearing delighted with their reception; several even remaining all night in the ship. The only part of their conduct calculated to excite the slightest suspicion in the minds of their new acquaintances was, that on returning to the shore, they were observed to strip themselves of the clothes which had been newly given to them, and resume their old ones; in every other respect they behaved to all appearance, with the utmost cordiality. This intercourse was rendered more easy, by the discovery of the resemblance between the language of the New Zealanders and that of the Tahitians, of which the French had a vocabulary on board: gradually all reserve seemed to vanish in mutual confidence, the officers and the crew visited, and even slept in the villages of the natives, shared their meals, and made excursions into the interior, accompanied by certain individuals, who had more especially attached themselves to the Europeans. Marion himself, whom the New Zealanders speedily perceived to be invested with supreme authority over his associates, was treated by them with every mark of enthusiastic affection; while he, on his part, unsuspecting of the horrible design concealed beneath so much fair seeming, went freely among them, avowing openly his entire confidence in their sincerity. The first lieutenant of the *Mascarin*, M. Crozet, from whose papers the Abbé Rochon compiled the account of the voyage from which these statements are derived, declares that

he vainly remonstrated with his commander on the imprudence of his conduct, and that he likewise warned his brother officers, but equally without effect.

Days and even weeks passed away, until the 8th of June arrived, without anything having occurred to justify the misgivings entertained by Crozet. On that day Marion went on shore, and was received with more than ordinary demonstrations of honour by the natives, who thronging round him, fastened on his head the four white feathers which form among them the insignia of chieftainship; probably thereby designing to render their intended victim, in some sort, the equal of the hapless Naginui. The French commander returned to his ship, delighted with the attention shewn him, and more confident than ever in the kind feeling of the islanders; but it was afterwards remembered that a youth, who had been on board all that day would eat nothing, refused any remuneration for some trifles he had brought with him, and departed in the evening apparently overwhelmed by sadness, and from that time neither he nor any other native revisited the vessel.

On the morning of the 12th, Marion again went on shore on a fishing excursion, accompanied by four officers and twelve men. The natives came to welcome the party, and proffered to carry them from the boat on their shoulders, to save them the inconvenience of stepping in the water. On landing, Marion and the officers went their way, and the seamen dispersed, as they were accustomed to do, to gather wood for the boat; while thus separated, the islanders surrounded them in overwhelming numbers, and on a given signal, fell upon them and beat out their brains with their stone hatchets. Of the twelve sailors one only escaped, he having been attacked by a smaller number of assailants, contrived, though wounded, to escape from them, and concealed himself in some thick underwood. From his hiding-place he saw the dead bodies of his messmates cut open and divided by their murderers, who at length left the spot, each one bearing away his portion of the horrid spoil; the fugitive then fled to the water, and the next morning swam to his ship. On hearing his sickening story, grief and indignation for the fate of the men was almost lost in anxiety—not so much for their captain and the officers who had accompanied him, for there was little room

for hope or fear on their account, but for a body of sixty men under the command of Lieutenant Crozet, who had been for some time occupied in cutting down trees, at a distance from the spot where the cruel massacre had been perpetrated. The long-boat of the *Mascarin* was immediately sent off with a strong party well armed, to communicate with Crozet; who, by a stratagem practised by Cook on a previous occasion on one of the islands of this very bay, succeeded in safely embarking his whole party. The natives followed them in crowds to the water-side, shrieking in their ears with savage triumph, and declaring that Tacouri (their chief) had killed and eaten Marion; but made no attempt to attack them, until they beheld them making preparations to enter the boat. At this sight their savage fury appeared about to break every bond, when Crozet, seizing his musket, commanded them to stand back, and drawing a line on the ground, threatened to shoot the first man who should overstep it. He then desired them to sit down, and instantly the whole of the natives, amounting to fully a thousand men, obeyed him, and remained seated until the last European had stepped into the boat; then, rising at once with a loud shout, as if released from a spell, they hurled a shower of stones and spears after the retreating party, who now able to retaliate, poured in volley after volley of musketry on the wretched multitude, who, stupefied with terror, actually stood still to be shot at. According to Crozet, they would all have been destroyed, had he not at length restrained his men from the further prosecution of their murderous work, and proceeded to the small island of Motu Roa, to remove the sick stationed there. This duty having been safely performed, it became necessary to procure a supply of wood and water before putting to sea; in accomplishing this object, a village in the above-named island (whose population at that period was estimated at about three hundred individuals), was attacked by the French, in consequence of its inhabitants evidencing some disposition to interrupt them. In this affair a great many of the natives were killed, but with such determination did they resist every attempt to capture them, that no prisoners could be secured: their children and women had been previously removed in anticipation of this conflict. Before the *Mascarin* and her companion vessel the *Marquis de Castries*

quitted the country, which they did on the 14th of July, 1772, Crozet, who succeeded Marion in the command, took possession of it in the name of his sovereign, calling it France Australe, and made a last attempt to set at rest any lingering doubt that might remain concerning the fate of Marion and his companions, by sending an armed party on the shore to make every possible search and inquiry. On arriving at the pah or village belonging to Tacouri, they found it deserted, except by a few old men, but were just in time to see the chief himself escaping, dressed in the cloth mantle of their unfortunate commander. In Tacouri's dwelling, they found several pieces of human flesh, some raw, and others roasted: in another hut they picked up part of a shirt, marked with Marion's name; and traced various other evidences of the horrible tragedy, doubtless enacted in this vicinity. They set fire to the pah, and also to another at a little distance, whose inhabitants had likewise sought safety in flight.

Thus terminated this ill-fated expedition, by which little additional information was acquired respecting New Zealand, for the French, during the four months they spent on its shores, visited only a portion of the coast line of the Northern island, which had previously been circumnavigated and described by Cook. On the minds of the natives, a deep and lasting impression remains of the fearful massacre by which their treachery was requited; and they continue, to the present time, to manifest a strong aversion to the Wee Wee's (oui oui), or "tribe of Marion." Nine months after the departure of the French vessels, New Zealand was revisited by Cook, who, having completed his first voyage round the world, and returned to England in July, 1771, had been shortly after appointed to lead another expedition, designed for the further exploration of the southern hemisphere.

Two ships (built for the coal trade), were purchased and equipped, the larger, named the *Resolution*, with a complement of 112 men, being placed under the command of Cook; the smaller, named the *Adventure*, with eighty-one men, being entrusted to Captain Tobias Furneaux. The vessels sailed from Plymouth on the 13th of July, 1772. Happily, the spirits of the voyagers were unsaddened by a knowledge of the calamities which had befallen the last adventurers in New Zealand, and the heavy hearts with which the survivors were then preparing to

leave its shores, their depression being, it is to be hoped, rendered deeper by the recollection of the savage butchery by which they had, in their turn, gratified that most blind, headlong, and cruel passion—revenge.

On the 30th of October, the *Resolution* and *Adventure* reached the Cape of Good Hope. On the 17th of January, 1773, they crossed the Antarctic circle, in $39^{\circ} 35' E.$ long., and proceeded south, until they attained to $67^{\circ} 15' S.$ lat., where their further progress was barred by immense masses of ice, among which Captain Cook deemed it imprudent, if indeed, it were not impracticable, to attempt a passage. He then changed his direction, and, after some further search for a southern continent, between the meridian of the Cape of Good Hope and New Zealand, during which the two ships became separated in a thick fog, he resolved to quit the high southern latitudes, and proceed to the latter place, hoping, on his way, to be enabled to visit the east coast of Van Diemen's Land, and ascertain whether it joined the coast of Australia. This he was prevented from doing by the wind continuing between north and west; he, therefore, shaped his course for New Zealand, whose western shore he sighted on the 25th of March, and, on the following day, anchored in Dusky bay (Middle Island), having been 117 days at sea, and sailed nearly 11,000 miles, without having once descried land. Here he remained till the 11th of May, the few inhabitants whom he found in this locality being easily conciliated. It is, however, but just to state, that Cook, on first meeting them, introduced himself in a manner which proved that he had profited by dear-bought experience. Instead of going on shore, as he had done on a previous occasion, accompanied by an armed party, and thus exciting the fears and suspicions of the natives; Cook, on perceiving a man standing upon the point of a rock, with a club in his hand, and attended by two women, each bearing a spear, threw towards them some trifling presents, such as medals, beads, &c., then landed alone, went up to the man, embraced him, and thus at once dissipated his alarm. Presently, the women joined them, and likewise some of the English from the boat: a friendly, but unfortunately not very intelligible conversation ensued, during which the volubility of the younger of the two females drew from one of the seamen the blunt remark, that "women did not want for tongue in any

part of the world." The intercourse thus auspiciously commenced was uninterrupted by any disagreement, and the voyagers pursued their explorations inland without any molestation. From Dusky bay, the *Resolution* proceeded northward along the coast to Cook's strait, and, on the 18th, joined the *Adventure* in Ship cove, where she had lain at anchor since the 7th of April. The vessels were visited by the natives, who made many inquiries concerning Tupia, the Tahitian who had accompanied Cook on his previous expedition, and appeared concerned when informed of his death at Batavia. Gardens were laid out on shore, stocked with various seeds; potatoes, turnips, carrots, and parsnips planted; and no animal, except the dog, being known to exist on any part of New Zealand, a ewe and ram, pigs, and goats were left for breeding. The ewe and ram, brought from the Cape of Good Hope, and preserved thus far with so much care, died the morning after they were landed, having, it is supposed, eaten of some poisonous plant.

The two ships continued here until the 7th of June, and then set sail to explore between the latitudes of 41° and 46° south, until they should arrive in the longitude of 140° or 135° west, purposing, in the event of no land being discovered, to proceed to Otaheite. This portion of their voyage bears no relation to our present subject, but it may be well to say that Cook so far accomplished his mission as to demonstrate, that if any southern continent existed, it must at least be situated in a very high latitude (as it really is, being within the antarctic circle.) On the 21st of October, 1773, the *Resolution* and *Adventure* again made the land of New Zealand, Table Cape (Northern Island) being first visible. In sailing along the east coast the two ships finally parted company during a heavy gale. Cook then proceeded to Queen Charlotte's Sound, and there for three weeks vainly awaited the arrival of Captain Furneaux. He found the gardens in a flourishing state, and everything he had planted untouched, except the potatoes, most of which had been dug up. Of the live stock only one sow remained. Cook had brought several hogs, and likewise fowls, from the Society Islands. Some of these he gave to the New Zealanders, while others he landed without their knowledge. During this visit Cook speaks of the people as certainly in some state of civilization. "Their behaviour to

us," he says, "was manly and mild, showing on all occasions a readiness to oblige. They have some arts among them which they execute with judgment and unwearied patience; they are far less addicted to thieving than the other islanders of the South Sea, and I believe those in the same tribe, or such as are at peace with one another, are strictly honest among themselves." Notwithstanding these favourable statements, Cook positively affirms his belief in their cannibalism, but declares that they eat no other human flesh than that of their enemies slain in battle. On this much disputed point, very revolting evidence was obtained. Returning on board after a brief absence, he found the quarter-deck crowded with natives, and was informed that one of his officers having brought from the shore the mangled head of a youth recently killed, had given a portion of the flesh to a native, who had broiled and eaten it with surprising avidity. This loathsome act was repeated by the order and in the presence of Cook; several seamen became sick at the horrid sight, and Oodidee, a youth who had joined the *Resolution* during her visit to the Society Isles, manifested the most passionate indignation, calling the English "vile men" for having permitted it, and vehemently upbraiding the individual, or, as Cook calls him, the *gentleman* who had cut off the flesh, refusing to accept or even touch the knife with which it had been done.

Despairing of the coming of her consort, the *Resolution* set sail once again upon a fruitless search for a South Pacific continent. In the garden laid out on Ship Cove, a bottle containing instructions for Captain Furneaux was buried underneath the stump of a tree, on which was cut the words "Look underneath." Eight days after the departure of Cook, the *Adventure* arrived, having been detained by adverse winds in Tologa Bay, and found the directions left for her guidance. Having refreshed and refitted, Captain Furneaux, previous to starting, sent a cutter with two officers and eight men to Grass Cove, there to gather wild greens (a kind of spinach) for the ship's company. The boat not returning, the *launch*, under the command of Lieutenant (afterwards Admiral) Burney, well manned, and accompanied by ten marines, was dispatched in search of her. The result was the discovery that another fearful massacre had been committed; not, however, in the opinion of Captain Furneaux himself, in pursuance of

any premeditated plan on the part of the natives, but occasioned by some sudden quarrel which had been decided on the spot. Lieutenant Burney, on reaching a small beach adjoining Grass Cove, saw a very large double canoe just hauled up, with two men, who on perceiving the launch immediately ran to the woods. On the shore were about twenty provision baskets, some of which were filled with fern-root (used by the natives for bread), others with the roasted flesh of the missing seamen. A hand was recognized as having belonged to Thomas Hill, one of the fore-castle men, the initials T. H. having been tattooed upon it at Otaheite; several shoes were likewise found, among others those of Mr. Wodehouse (a midshipman). At Grass Cove large numbers of the islanders were assembled, who hallooed to the English, and made signs to them to land, but they were soon dispersed by volleys from the marines, whose fire was not very destructive, for their muskets having got wet, several of them missed fire. While seeking for the lost cutter, along the back of the beach, a shocking scene presented itself—the heads, hearts, and lungs of the murdered men being found on the ground, while at a little distance the dogs were gnawing their entrails. The mangled remains were collected and placed in the launch, which then returned to the ship, Lieutenant Burney and Mr. Fannin being of opinion that it was useless to incur danger by proceeding, as they "could expect to reap no other advantage than the poor satisfaction of killing some more of the savages."*

Captain Furneaux was compelled by the state of the wind to remain in the *Sound* four days after this horrible transaction, during which time none of the inhabitants made their appearance; he then proceeded to England, *via* the Cape of Good Hope, without seeing any more of Cook, who meanwhile traversed the Southern Pacific, and returned to his old anchorage in Ship Cove, in October, 1774. The natives did not approach the vessel, and nothing was seen of them until one day, Cook, unsuspecting of their just cause of alarm, proceeded in search of them. When he and his companions were recognised, joy immediately took place of fear; those who had fled to the woods hurried from their hiding-places

* Cook was informed by the natives, in 1777, that not one shot fired by Lieutenant Burney's party had taken effect, so as to kill or even to hurt a single person.

to join in welcoming the visitors, leaping and skipping about like madmen. From their vague and contradictory statements, when questioned concerning the *Adventure*, Cook could gain little information beyond the fact of her having anchored in the Cove during his absence, which he had already conjectured from having observed that several trees had been recently cut down with saws and axes, together with other indications of a similar nature. On the 11th of November, Cook sailed from New Zealand, taking his departure a third time from Cape Palliser; touching at the Cape of Good Hope on his homeward route, he there received a letter left for him by Captain Furneaux, containing an account of the loss of the cutter and her crew. On the 30th of July, 1775, he reached England, after an absence of three years and eight months, having during this arduous expedition lost but four men, and only one of them by sickness.

In 1777, our skilful navigator paid his fifth and last visit to New Zealand, while performing his third voyage round the world in the *Resolution*, accompanied by the *Discovery*. The first land made was Rocky Point, on the west coast of Middle Island; thence, Cook proceeded to his old moorings in Queen Charlotte's Sound, where he had not lain long before the inhabitants, apparently recognising his ship, came alongside; but on seeing Omai, a native of the Society Isles, who had been on board the *Adventure* at the time of the massacre, they drew back, fearing that Cook having become acquainted with their guilt, intended to avenge his countrymen. On being assured that he entertained no hostile intention, they readily laid aside distrust, and the English having formed an encampment on shore, a great number of families came from different parts of the coast, and took up their residence close to them. When all alarm as to its consequences was removed, they spoke freely of the fate of the crew of the cutter, pointing out the place where the butchery had been committed. However cross-questioned, they constantly affirmed that (as Captain Furneaux surmised) it had been wholly unpremeditated, but differed in their accounts of the originating cause. Some stated that while the boat's crew were sitting at dinner, a native brought a stone hatchet to barter; the sailor to whom it was offered took it, and would neither return or give anything

in exchange, on which the owner of it snatched up some bread as an equivalent, and then a quarrel ensued, in which two New Zealanders were shot dead by the only two muskets fired; for before the English had time to discharge a third, they were overpowered by numbers, and immediately put to death. Others described the affray to have arisen between the natives and a black servant belonging to Captain Furneaux, who had been left in charge of the boat. Both statements may be true, as they agree in point of time, for it is very possible that some of the natives may have been endeavouring to rob the boat, while others (with or without the excuse assigned), were taking some liberties with the property of the people on shore, which being too hastily resented, led to a fearful result.*

Within a fortnight the ships again put to sea, and Captain Cook took his final leave of New Zealand. The kindness which, during this and the three preceding visits he had manifested to the natives, and the confidence which he had reposed in them had entirely obliterated the painful impression created by his early conduct, and they long retained an affectionate remembrance of him, and neglected no opportunity of making enquires concerning him, appearing grieved and indignant when informed of his untimely fate.

New Zealand remained unvisited by any European ships from 1777 to 1791, when Captain Vancouver touched at Dusky Bay, while engaged on an expedition to survey and explore the north-west coast of America. About this time an intercourse sprang up with the newly formed British settlement at Sydney Cove, and various whaling and sealing ships began shortly after to frequent these shores.

In 1793, the governor of New South Wales, sent a vessel to the Bay of Islands, with orders to bring away one or two of the inhabitants and convey them to Norfolk Island, where it was hoped they would instruct the English in their method of dressing the description of flax (*phormium tenax*), which abounds there, as in New Zealand. Two natives were accordingly enticed on board, and immediately carried away. On arriving at their destination they were not unwilling to impart any information in their possession, but on the desired point they were completely ignorant, the operation in question being among them the peculiar

* See Cook's third voyage, p. 51.

province of the women, and they somewhat haughtily informed Captain King the superintendent of the settlement, that one of them being a warrior and the other a priest, the dressing of flax had never made any part of their studies.* But although uninitiated in the mysteries of spinning and weaving, they were able to communicate many details respecting the geographical and political condition of their country, and even drew a map or chart of the Northern Island, which was found to bear a great similitude to Captain Cook's delineation. They remained a considerable time at Norfolk Island, and were then safely restored to their native country, favourably impressed by the kindness with which they had been treated by Captain King and his family.

Emboldened by this example, several of the natives who, (like most islanders, have an innate love of maritime pursuits,) made cruises in different vessels, some of them visited New South Wales, where they were kindly received by Governor Macquarie, and sent back with presents of live stock, and useful seeds, and whatever else was likely to inspire them with a desire for civilisation; but their admiration was, unhappily, most generally excited by the varied and efficient means of warfare possessed by the Europeans. At length, a powerful chief, named Tippahce, accompanied by his five sons, came to Port Jackson, and on seeing the different arts and manufactures carried on by the settlers, was so affected by the conviction thus forced upon him, of the barbarous state of ignorance in which his own country was shrouded, that he burst into tears, and exclaimed in the bitterness of his heart, "New Zealand no good." On returning to his home near the Bay of Islands, Tippahce took with him a young Englishman, named George Bruce, to whom he gave one of his daughters in marriage. Bruce used his influence, which was considerable, for the benefit of such vessels as touched at the island, and lived very contentedly, until a ship named the *General Wellesley* put in at a part of the coast where he and his wife chanced to be; her commander, a Captain Dalrymple, induced them, by the most solemn assurances of bringing them back in safety, to come on board, in order to assist him in searching for gold dust, which he expected to discover somewhere

about the North Cape. Being unsuccessful in his investigations, Dalrymple, regardless of the remonstrances and entreaties of his unfortunate passengers, refused to fulfil his promise of landing them at the Bay of Islands, and retaining them both, proceeded on his voyage to India. He left Bruce at Malacca, but carried off his wife to Penang, where he sold her to a Captain Ross; Bruce contrived to follow her, and by the interference of the governor, she was restored to him. After several delays and disappointments, the two were conveyed to Calcutta by Sir Edward Pellew, whence it was expected they would obtain a passage to New South Wales, and from thence reach New Zealand. Whether they ever succeeded in regaining their native country has not been recorded, as the account from which the foregoing statements are derived, was written while they were still in India.†

The year 1809 is memorable in the annals of New Zealand for a most fearful butchery. Towards the close of the year, the *Boyd* left Sydney for England, with seventy persons on board, besides four or five New Zealanders, whom her master, Captain Thompson, promised to convey back to their native country, it being his intention to touch there on his way, to make up his cargo by taking in some spars for the Cape of Good Hope. Among the New Zealanders was the son of one of the chiefs, known among the sailors by the name of George, who, during the voyage, refused to work, pleading in excuse, his rank, but still more his ill-health. The captain treated both representations with ridicule, and had him twice tied up to the gangway and severely flogged, at the same time lessening his allowance of food. In reply to the taunting assertion that he was no chief, George merely remarked, "that they would find him to be such, on their arrival in his country;" and so well did he disguise the revengeful passions excited by the treatment he had received, as to succeed in persuading the captain to put in at Wangaroa (where his tribe resided), as the best place for procuring the spars, although it was not known that the harbour had ever before been visited by any European vessel. On arriving, the crafty savage landed alone, and after a brief interview with some of his tribe, returned to the ship, and invited the captain to come on shore

volume on the "New Zealanders" in the *Library of Entertaining Knowledge*.

† See Turnbull's *Voyage round the World*, and the

and point out the trees that would suit his purpose. Three boats were accordingly manned, and the captain landed and proceeded with his party towards a wood, which they had no sooner entered, than they were attacked by the savages, and every one of them put to instant death. George and his associates disguised themselves in the clothes of their victims (it being now dusk), and went off in the boats to the *Boyd*,—got on board by a stratagem, and there slaughtered indiscriminately every man, woman, and child, excepting five seamen who had escaped to the shrouds, and a woman, two children, and a cabin-boy whom George preserved in gratitude for kindness he had received from him during the voyage. When morning dawned upon the ill-fated vessel, the sailors who had taken refuge in the rigging still maintained their dreary watch; at length, Tippahee, the chief whose visit to New South Wales has been related, came alongside in his canoe, and informing them that he had just arrived from the Bay of Islands to trade for dried fish, offered them his protection. The men descended, entered his canoe, were safely landed by him, although closely pursued by the Wangaroa tribe; but the savages leaping on shore, soon overtook them all, and forcibly detaining the old chief, murdered them before his face.*

The ship was thoroughly ransacked; the muskets and ammunition were deemed invaluable; and the father of George, eager to try a gun, of which he had taken possession, burst in the head of a cask of gunpowder, filled the pan, snapped the lock over the cask, and was himself, with thirteen of his companions, blown to atoms. The ship took fire, and burnt to the water's edge.

The four individuals whose lives had been spared were rescued from their distressing position by the intrepidity of Mr. Berry, the supercargo of the *City of Edinburgh*. While engaged in taking in spars, he was informed of the melancholy tragedy which had very recently been enacted. He immediately resolved to ascertain if any persons belonging

to the *Boyd* yet survived; and, at the risk of his own life, succeeded in rescuing the whole four. The last he recovered was a little girl, two or three years old, who, on being subsequently questioned respecting her mother, drew her hand across her throat; and on further inquiry, said, with every appearance of painful feeling, that the people had cut her up, and eaten her, like victuals.*

The destruction of the *Boyd*, at Wangaroa, did not deter English vessels from continuing to visit other ports in New Zealand, or prevent the whalers and sealers from pursuing their avocation on its shores, which then abounded in the objects of their pursuit, especially in seals; but it materially impeded the sanguine hopes entertained for the amelioration of the moral and social condition of the inhabitants, by throwing all their better qualities into the shade, and rendering them, in the eyes of ordinary observers, brutal and irreclaimable savages. Some philanthropic individuals, nevertheless, maintained a more correct appreciation of the better parts of the character of the New Zealanders; and, hopefully anticipating for them a brighter future, struggled on, through discouragements of every kind, to further the good cause. Of these estimable persons, the one most strongly impressed with the capabilities of the New Zealanders for Christian civilization was the Rev. Samuel Marsden, senior chaplain of New South Wales, to whose excellent character I have previously adverted. (Div. iii. p. 409.) Whenever any of the New Zealanders arrived at Sydney, they found a protector in this good man, whose hospitable mansion at Parramatta became their temporary home. There I often witnessed the efforts made for their instruction, not only in reading and writing, but also in agriculture and the mechanical arts.

The remarkable aptitude evinced by this singular people for the acquisition of knowledge, and their disposition to embrace the doctrines of Christianity, had led Mr. Marsden, in the year 1808, to suggest to the Church Missionary Society of London, for

* The presence of Tippahee was peculiarly unfortunate, not only was he the unwilling instrument of delivering the seamen into the hands of their ruthless assassins, but some of his enemies informed the masters of four or five whaling vessels, who shortly after the massacre landed at the Bay of Islands, that he had instigated it, whereupon the whalers united their forces, and attacking the island where he resided, murdered the inhabitants without regard to sex or

age, and burned or destroyed whatever grew or stood upon the soil. Tippahee himself, though severely wounded, escaped with life. He was subsequently killed in an encounter with the people of Wangaroa, which is said to have originated in the deplorable events detailed. Tippahee's tribe afterwards murdered three sailors in revenge for the attack on their island.

† See Mr. Berry's narrative, *Constable's Miscellany*, pp. 350, 351.

whom he acted as agent, the formation of a missionary establishment at New Zealand; recommending that the persons selected for the purpose should, simultaneously with intellectual and spiritual knowledge, be fitted to instruct the natives in the pursuits of agriculture and the mechanical arts; considering that, thus conjoined, Christianity and civilization might rapidly overspread the land.

The society entered cordially into his views, and sent three missionaries, Messrs. Hall, King, and Kendall, with their families, to New South Wales, where they remained for a considerable time, being unable to obtain a passage to the Bay of Islands, on account of the fear entertained, by the ship-masters, of the natives in that vicinity.

In these apprehensions Mr. Marsden did not share. His personal intercourse with some of the New Zealanders had convinced him that his projects in their favour would be warmly seconded by several of the more influential of their chiefs. Of these, the one on whom he placed most reliance was Duaterra, a near relation of Tippahee's, and subsequently his successor as chief of their tribe. Duaterra was a man of clear understanding and commanding appearance, and possessed a degree of acquaintance with the English language very rarely attained by a New Zealander, which rendered him an invaluable auxiliary to the missionaries.

It may be well to recount briefly the series of events which brought Duaterra under the notice of Mr. Marsden, especially as the vicissitudes of his early life afford, it is to be feared, a sample of the injustice and cruelty with which some of the whalers and scalers (a class too generally composed of men of dissolute and lawless lives) treated the natives, whose revengeful passions were, as we have seen in the case of George, often fatally called into action. Duaterra, when a youth of about twenty, formed an ardent desire to visit England and see King George. He accordingly shipped himself as a common sailor on board the *Santa Anna*, then bound on a voyage to Bounty Island for a cargo of seal-skins. On arriving there, he and thirteen others were put on shore to kill seals, while the vessel proceeded for supplies to Norfolk Island and New Zealand, leaving the fourteen men very insufficiently furnished with provisions. Five months elapsed before she returned, during which time Duaterra and his companions had undergone such extreme suffering from thirst

and hunger, no water and scarcely any food being procurable on the island, that three of them had died. They had, however, collected about ten thousand skins; with which the *Santa Anna* proceeded on her way to England, and at length arrived in the Thames in July, 1809. Poor Duaterra thought the object for which he had patiently endured so many hardships at length attained, but soon learned that he was as far from it as ever. Instead of succeeding in obtaining a sight of the king, he was told at one time that he would never be able to find the house, at another that nobody was permitted to see his majesty. The master of the *Santa Anna*, a person named Moody, would scarcely permit him to go on shore, and never allowed him to spend a night out of the ship, peremptorily refused to give him either wages or clothing, and in about a fortnight put him on board the *Ann*, a vessel on the eve of sailing with a body of convicts for New South Wales. It providentially happened that Mr. Marsden at this very time was preparing to return to the scene of his labours. He embarked in the *Ann* at Spithead, and there found Duaterra dangerously ill from the effects of bodily and mental suffering, spitting blood, and miserably clad. The New Zealand chief received from the Christian minister, and through him from the master and surgeon every attention; his health was gradually restored, and he cheerfully resumed the duties of a common sailor. On arriving at Sydney, in February, 1810, Duaterra accompanied Mr. Marsden to his private residence, and there remained until November, diligently employed in learning husbandry and useful arts. The chief entered warmly into the project of Mr. Marsden for the establishment of a Christian Mission in his country—offered a grant of land, and promised to protect the missionaries, their families, and friends. Accompanied by three of his countrymen, he shipped on board a whaler named the *Frederick*, in order to regain his native land. On reaching *North Cape*, the New Zealanders went on shore, and returned to the vessel with abundant supplies of potatoes and pork, expecting to be landed according to their agreement at the Bay of Islands. But the inhuman master (whose name is not recorded) refused to fulfil his promise, although the ship was actually at the mouth of the bay, and carried away the unfortunate natives to Norfolk Island, where he first

made them go on shore to get water, in which attempt they were all nearly drowned in the surf, and then, having no further occasion for their services, left three of them on the island, taking the other (a son of Tippahee) with him. Of this youth nothing more is known, for the *Frederick* was taken on her passage home by an American privateer, after an action in which the master was mortally wounded, and the chief mate killed. Duaterra and his friends were found naked and famishing on Norfolk Island by Mr. Gwynn, master of the *Ann* whaler, who touched there soon after the departure of the *Frederick*. By him they were clothed, fed, and conveyed to Sydney, where Duaterra again sought an asylum beneath the roof of the good Samaritan of New South Wales, by whose kind offices he was eventually conveyed safely home, laden with seed wheat, agricultural tools, &c., bearing with him (notwithstanding his sufferings) a deep conviction of the blessings attendant on Christian civilization.

Shortly after Duaterra's return, Mr. Marsden resolved no longer to delay putting his cherished scheme in execution: the missionaries, on their part, were quite willing to make the attempt. Being still unable to hire a vessel, except on the most exorbitant terms, he purchased a brig, named the *Active*, resolving, should he succeed in establishing a settlement, to keep up constant communication with it. Not thinking it prudent to send the families of the settlers over in the first instance, he proposed going himself, accompanied by Messrs. Hall and Kendall. Governor Macquarie, alarmed for his safety, refused to permit him to depart, and he was therefore compelled to allow the *Active* to sail without him, sending by the above-named missionaries a message to Duaterra, inviting him to return in her to Port Jackson, and bring with him two or three other chiefs.

The arrival of the *Active* was hailed with joyous acclamation, Duaterra welcomed with delight the friends of his benefactor, and consented to return to Sydney along with two other chiefs, one the celebrated E'ongi, mis-spelt Shongai and Shungee, the other, a great warrior, named Korra-korra. This proceeding convinced Governor Macquarie of the friendly feeling entertained by the New Zealanders, and induced him to take steps for their protection against the frequent depredations committed by the masters and seamen of whaling vessels.

With the concurrence and co-operation of the two chiefs, Mr. Kendall was empowered to act as a magistrate in their country, and a proclamation was at the same time issued, dated "Government House, Sydney, New South Wales, 9th November, 1814," announcing, that it had "been represented to His Excellency the Governor, that the commanders and seamen of vessels touching at, or trading with, the islands of New Zealand, especially that part called the Bay of Islands, *have been in the habit of offering gross insult and injury* to the natives of those islands, by violently seizing on and carrying off several of them, both males and females, and treating them, in other respects, with injudicious and unwarrantable severity, to the great prejudices of the fair intercourses of trade, which might be otherwise productive of mutual advantages." His Excellency, in consequence, prohibited the removal of any natives from New Zealand, without the express permission of the chief or chiefs within whose territory the natives so to be embarked should happen to reside, such permission to be certified, in writing, under the hand of Mr. T. Kendall, the resident magistrate in the Bay of Islands, or the magistrate for the time being in the said district. By the same proclamation it was declared unlawful for any commander to land any person in New Zealand without the permission of the chiefs, confirmed by that of the resident magistrate. Such was the commencement of British authority in New Zealand, induced by no lust of territorial power, and no thirst for conquest; but simply by a desire to protect the people from aggression, and at the same time to confer a public sanction on the proceedings of the humble, but zealous ministers of the gospel, who, as messengers of its good tidings, were content to place in the hands of a people among whom cannibalism and infanticide were reported to be crimes of daily occurrence, not their own lives only, but those of their wives and little ones.

On the 19th of November, 1814, Mr. Marsden, accompanied by a gentleman named Nicholas (whose interesting work, entitled, *A Voyage to New Zealand*, contains much valuable information), the missionaries and their families, and the chiefs and their native attendants, embarked on board the *Active*, whose heterogeneous freight of horses and cattle, sheep and goats, cats and dogs, pigs and poultry, seemed as if collected in imitation of Noah's ark. When

on the eve of sailing, a strong gale commenced, by which the party were detained a week in the harbour.

During this time a sudden change was observed in the demeanour of Duaterra, which excited great uneasiness in the minds of the adventurers, who well knew how much (humanly speaking), depended upon his zealous co-operation,—his former lively and animated manner having totally given place to a kind of morose melancholy. The other two chiefs had likewise become moody and uncommunicative. At length Duaterra plainly declared, that he bitterly regretted the encouragement he had given to the missionaries, as he had just learnt from a gentleman at Sydney, that they would shortly introduce many others, and either destroy the natives, or reduce them to slavery; his informant (whose name Duaterra withheld from a principle of honour), bade him, if he doubted his assertions, look at the existing state of the natives of New South Wales, and inquire of them what treatment they had received from British colonists.

Mr. Marsden assured the New Zealanders that neither ambition nor avarice had prompted the present enterprise, and added that he was ready to afford the best proof of disinterestedness, by relanding the missionaries and their families, and never more attempting to hold any intercourse with their country; whereupon Duaterra, really solicitous to promote the civilization of his people, and moreover, gratefully attached to Mr. Marsden, implored his pardon for having for a moment doubted the single-mindedness of his views, and entreated him to proceed; at the same time warning him, that owing to the misrepresentation his companions had heard, he could not vouch for their good faith, and therefore advised that the settlement should be established in the Bay of Islands, where he and his tribe could easily protect it.

On receiving a promise that his wishes in this respect should be complied with, Duaterra resumed his usual good humour. This unexpected obstacle being removed, and the wind becoming favourable, the *Active* set sail, and reached North Cape on the 17th December. Here Duaterra landed to procure green fodder for the live stock. The chief of the district came off to the brig, and on being informed of the proclamation of the governor, and the intended establishment of the missionaries and their

families, he expressed his satisfaction, appearing, like the generality of his countrymen, pleased with the idea of white men taking up their abode in New Zealand. Among other chiefs from whom the party met a hospitable reception was George, the dreaded leader of the Boyd massacre. Duaterra, whose judgment and sincerity had been throughout implicitly relied on, having first had an interview with George, advised Mr. Marsden and the missionaries to visit the encampment where he and about a hundred and fifty warriors were assembled. Sensible of the importance of conciliating these people, the intrepid adventurers complied immediately, and, notwithstanding the horrible associations connected with them, and the sight of the dollars plundered from the *Boyd*, which they wore suspended as ornaments on their breasts, the meeting fully answered the desired purpose. As a proof of entire reliance on the good faith of their new allies, Mr. Marsden and Mr. Nicholas remained all night in the camp, lying down to rest, at the particular request of George, beside himself and his wife. George shewed them every attention in his power, and appeared very desirous to obtain their good opinion, nevertheless Mr. Nicholas states that there was an expression of malignity and treachery in his countenance, which, added to a coarse familiarity of manner, acquired from his intercourse with European sailors, and a sort of sneering impudence peculiar to himself, was calculated to make a very disagreeable impression, even upon those who did not previously regard him with abhorrence, as the perpetrator of a fearful crime.

In reply to the questions of Mr. Marsden, he gave an account of the catastrophe of the *Boyd*, very similar to that already related; but he showed no remorse for his wickedness, declaring himself to have been justified in thus revenging the insults and injuries causelessly heaped upon him both by the captain and the crew.

The following morning the two Englishmen returned to the *Active*, accompanied by George and other natives, among whom printed copies of Governor Macquarie's proclamation were distributed, the purport of it being explained to them by Duaterra, who then, turning to George, commenced an admonitory lecture, in which he assured him that the horrid deed he had committed would not be visited with retaliation; but that in the event of his ever again at-

tempting to cut off another vessel, "Governor Macquarie would send a ship with such a number of men as would instantly destroy every living soul at Wangaroa." On the 22nd of December the *Active* was steered into the Bay of Islands, by the directions of Duaterra, who was well acquainted with its hidden dangers, and anchored in safety abreast of Ranghoo, his place of residence. The name of Marsden was familiar in the mouths of the people, who, when he landed, crowded around him with every demonstration of affectionate regard. They watched with great interest the arrival of the boats with the cattle, but on seeing the cows and horses, they became perfectly bewildered with astonishment, their wonder increasing tenfold when Mr. Marsden, mounting a horse, rode it up and down the beach. They had, it is true, heard of this animal and of the use made of it, from several of their travelled countrymen; but they had derided these statements as idle tales, for, having tried the experiment of bestriding pigs, and found them quite unmanageable, they maintained that larger animals would necessarily be yet more impracticable steeds.

Duaterra, aided by some of his people, diligently set to work to enclose a piece of land for a stock-yard; suspending, however, this useful labour for a while, he performed one of a more noble nature, to the execution of which he was prompted solely by his desire to further the objects of the mission. With some planks and an old canoe, he managed to fit up a place for the temporary celebration of divine worship, forming a kind of reading desk (covered over with the black cloth manufactured in the country,) for the minister, and arranging in front of it long planks supported like forms, for the congregation. Here, on Christmas-day (1814), which was

also the sabbath, the beautiful service of the Church of England was performed for the first time in this heathen land, the sailors showing, by their orderly and serious deportment, that they were not unaffected by the peculiar solemnity of the occasion, while the natives, of whom large numbers were present, sat, knelt, or stood, according to the example of the Europeans, and listened in silence to the discourse addressed to them by Mr. Marsden, through the medium of Duaterra. After this auspicious commencement, all went on smoothly.

A piece of land in the district of Hioshee, of about 200 acres, was bought from Ahoode Gunna, and his brother Warree, for twelve axes; and by a deed of assignment, signed, sealed, delivered, and dated 24th of February, 1815, made over to the Church Missionary Society for ever.* Timber was purchased and brought to the required spot by the natives, dwellings erected, land cleared, and seed sown. Mr. Marsden remained in New Zealand until the end of March, 1815, and then, having seen the mission peacefully established, he returned to New South Wales. A few days before his departure, Duaterra was seized with an attack of fever and dysentery, and expired when he was on the eve of sailing; the other chiefs, however, promised that his death should cause no alteration in their conduct, and E'Ongi, the most powerful of them all, promised to take the missionaries and their defenceless families under his especial protection. Ruthless and ferocious as he afterwards proved, the chief kept his word through life, and even in death, for in his last moments, he besought his followers to allow the Church missionaries to remain in peace, because "they had ever acted for the best;" thus paying a noble tribute to their conduct during fourteen years of trial and vicissitude.†

* A copy of the deed is given in Vol. ii., p. 195, of Nicholas' *New Zealand*, published in London in 1817.

† E'Ongi possessed, in a remarkable degree, the characteristics which have distinguished many so-called heroes, viz.—an insatiable thirst for power, quick perceptions, untiring energy, indomitable courage, and a total disregard for the sanctity of human life. His figure was slight, his countenance handsome, though much tattooed, and his demeanour, in time of peace, peculiarly quiet and inoffensive. The chief amusements of his early life are said to have been carving on wood, in which art he had attained considerable proficiency, and playing with little children. His ambition, afterwards his leading passion, appears to have been first manifested

on his return from England, which country he visited in 1819-20, and while there, was honoured with an audience of George IV., who presented him with a coat of mail and various warlike presents. The chief returned home with abundance of muskets and ammunition, and as he could command the services of several thousand warriors, he resolved to attempt to subdue all the other chiefs, and make himself king of New Zealand. On his arrival, he at once commenced a ruthless and exterminating warfare, giving no quarter, and pursuing all who opposed his design with demoniacal fury. On one occasion, having slain a chief named Hinaké, he drank the blood as it gushed from the decollated head; in the same contest, owing to the immense advantage possessed by him and his followers, in their

George, on the contrary, under whose protection the Wesleyan missionaries were placed, behaved towards them with his customary faithlessness, and on his death-bed, expressed a desire that all the missionaries should be extirpated, as he feared that the introduction of Europeans would eventually lead to the destruction of his countrymen, or that they would be reduced to the miserable condition of the Australian aborigines, whom he had seen lying intoxicated in the streets of Sydney, and begging their food from door to door—suppliants for the necessaries of life from those who had possessed themselves of their country and its resources. To return:—the Church missionaries were no sooner located in the Bay of Islands, than several merchants of Sydney memorialized Governor Macquarie for permission to establish a factory in New Zealand, and to form themselves into a commercial company, with an *exclusive* right of trade. The governor considered the request for a monopoly unreasonable, but referred the decision of the memorial to the home government, stating, however, that he saw no objection to sanctioning the establishment of a factory in New Zealand, *with the permission of the native chiefs*. Nothing further was done in the matter; but several of the Sydney mercantile firms, from time to time, formed agencies at the Bay of Islands, and at different parts of the coast where whale oil, flax, timber, pork, and potatoes were procurable in exchange for fire-arms, blankets, axes, and other articles. Meanwhile the New Zealanders were cruelly ill-used by the crews of many of the European vessels who visited their shores; and it is stated in the records of the Church Missionary Society, that within the first two or three years of the establishment of their settlement in New Zealand, not less than a hundred of them had been murdered by the Europeans; the natives, on their part, too frequently (as in the case of Marion) retaliating by punishing the innocent who

supplies of arms and ammunition, two thousand of the enemy are supposed to have been destroyed, and a large number of prisoners taken and carried away as slaves to the Bay of Islands. The tribes resident on the river Thames, at Wangaroa, North Cape, and Waiappa or the East Cape, were swept off by thousands. In his expeditions, E'Ongi was constantly accompanied by his blind wife, Turi, on whose counsels he placed much value, a circumstance which renders the atrocious ferocity that distinguished them the more remarkable. Polack (whose testimony in this respect is supported by other authorities), speaking of one of E'Ongi's

came within their reach, for the crimes committed by the guilty, who had escaped with impunity.

In 1822, the Wesleyan mission was established, in accordance with the suggestions of the Rev. W. Leigh, who, while acting as a missionary of that society in New South Wales, was induced to visit New Zealand by the representations of the Rev. S. Marsden. The London committee adopted the views of Mr. Leigh, who, in conformity with their instructions, accompanied by his wife, and two fellow-labourers with their families from England, proceeded to Wangaroa, thirty-five miles from the Bay of Islands. At first they were well received, but subsequently had to undergo much trial and privation, notwithstanding which, they were enabled to maintain their ground, and even make progress in forming schools, &c., until, in 1827, E'Ongi, having made war upon the tribes among whom they were residing, plundered the little settlement of *Wesley Dale*, making however, an exception to his ruthless policy of extermination, by suffering its inhabitants to escape with their lives to the Church Mission, which remained unmolested under his powerful protection. Thence the Wesleyans proceeded to Sydney, where I became acquainted with them, and heard, from their own lips, of their past struggles, and the threats used to deter them from returning, but in vain. The earnest entreaties of their friends were equally insufficient to prevail with these servants of the Lord; for they knew that "*no man, having put his hand to the plough, and looking back, is worthy of the kingdom of heaven*;" and in little more than a year they re-established themselves in New Zealand, accompanied by their faithful help-mates, who, sharing their zeal for the propagation of the gospel, were equally willing to lay down their lives, and those of their children, for its sake. The Master whom they served guarded them in the heathen land, whither they went as his messengers. Their

campaigns, says, "the ovens were crowded with human victims, and the places around presented dreadful scenes of carnage. All parts of the human body mangled, were strewn about in every direction—the sucking infant, the aged mother, the young female, and the venerable parent—all lay in undistinguished masses; and clotted gore in deep puddles bedabbled the adjacent paths." Such slaughter was tending to the rapid depopulation of the North Island, when the career of this man-slayer was stopped by a gun-shot wound in the lungs, through which the air whistled for fifteen months previous to his death.

brethren of the Church Mission were similarly defended; and though, many a night, when the savages among whom they dwelt, maddened by their refusal to procure for them fire-arms or gunpowder, departed from their humble dwellings, telling the trembling women that the stones were then heating to roast their flesh, and that of their little ones, yet these threats were in no instance fulfilled, and not a hair of their heads was harmed.

This time the Wesleyans took up their abode on the Hokianga river, on the western coast, and, by the blessing of God, were enabled to extend their operations southward, as far as Port Nicholson, in Cook's Strait; the church missionaries meanwhile exerting their endeavours in behalf of the inhabitants of the eastern portion of the island. The two Christian bodies worked harmoniously, in a spirit of love and charity, upholding each other, and making common cause against the various difficulties of their trying position. Of these, the most hard to endure was the constant counteraction of their efforts for the conversion and civilization of the Maories, by the demoralizing effect of their intercourse with the crews of the English, American, and French whalers which frequented the coasts, especially the Bay of Islands, and, together with some runaway sailors and convicts from Sydney and Van Diemen's Island, and other individuals from the same places, who, with a few exceptions, came to New Zealand, bankrupt in fortune or in character, and too frequently in both, made up a society whose lawless and dissolute members, abjuring the common decencies of life, and encouraging each other in every vice and every excess most degrading to human nature, obtained from the natives the appellation of *the devil's missionaries*.*

* Jameson, when alluding to the share in the civilization of the New Zealanders which the influence of even this commencement of commercial intercourse might be supposed to have had, thus expresses his opinion on the subject:—"From all that I have seen or heard respecting the fixed traders in New Zealand, or the casual visitors for the purpose of trade, it may be affirmed, in the most positive terms, that *not one of them has ever attempted to teach a native to read or write, or to communicate to his mind one ray of Christian knowledge or of moral rectitude*. With a few honourable exceptions, they have been, in their intercourse with the natives, guided by one ruling impulse—the love of gain. Their predominant aim has been to obtain the greatest possible quantity of pigs, potatoes, flax, maize, labour, or land, in exchange for the smallest possible amount of tobacco, ammunition, and piece goods.

The ministers of religion had, ever since their arrival, strenuously laboured to prevent the destructive conflicts among the aborigines, then of daily occurrence. "More than once," says Mr. Jameson, "have they conveyed information to a tribe threatened with a secret and treacherous attack, and frequently have they acted as mediators between parties assembled for hostile purposes." The depraved wretches above described took a malicious pleasure in thwarting them in this, as in all other ways, by fostering the revengeful passions of the Maories, and, for a bribe, enabling them to commit most atrocious cruelties; although they well knew, that but for the presence and restraining influence of those very men whom they scoffed at, and whose efforts they wickedly and foolishly endeavoured to contravene, they would, again and again, have been put to death by one tribe or another, if not by a general rising of the whole, so general was the odium excited by their villainy.

Some of the instances placed on record by the Aborigines Committee in 1837, of the atrocities committed by European captains and seamen, are most horrible. Of these, the following may serve as an illustration:—In December, 1830, a Captain Stewart, commanding the brig *Elizabeth* (trader), on promise of ten tons of flax, took above 100 New Zealanders from Kapiti, or Entry Island, in Cook's Strait, to Takou, Banks' Peninsula, concealed in his vessel. He then enticed on board the chief of Takou, his brother, and two daughters, who came unsuspecting of any ambush. On entering the captain's cabin, the door was locked upon the unhappy chief, his hands were tied, a hook with a cord attached was stuck through the skin of his throat, under the side of his jaw,† and the line fastened

One art of civilization the natives have acquired from their commercial visitors—that of bargaining; and in this, their proficiency is such as to render them able to cope with the keenest of their customers. By dint of experience, they have learnt to judge accurately respecting the quality and value of every manufactured article in common use that can be submitted to their inspection. But it is to missionary labour only that we can justly attribute the abolition of infanticide, polygamy, and the atrocities of native warfare, which have disappeared before the dawn of Christianity."—*Travels in New Zealand*. By R. G. Jameson, Esq. (P. 266.)

† Mr. Montefiore stated, in his evidence before Parliament in 1838, that the chief was not confined in the manner above described, but that he was so cruelly ironed as to cause mortification in his legs.

to some part of the cabin; in which state of torture he was kept for two days, until the vessel arrived at Kapiti, where he was put to death, together with his wife and two sisters. One of the children, who clung to her father, and cried out, was dragged from him, and killed on the spot. All the men and women who accompanied the chief were massacred, as were also many more, who came off afterwards in several other canoes to barter with the English. A party of the sailors were then sent on shore with the Kapiti savages, to aid them in slaughtering all the men, women, and children they could find; and, as a crowning enormity, the "ship's coppers" are even stated to have been employed in cooking the remains of the victims for the cannibals, whose brutal ferocity was not yet satiated.

General Darling, the governor of New South Wales, on being made acquainted with the circumstances of this most disgraceful transaction, referred the case to the crown solicitor, with directions to bring the offenders to justice; but, through some unexplained legal difficulty, this was never effected. Stewart, was indeed held to bail; but the other parties implicated, and the sailors, who might have been witnesses, were suffered to leave the country; and, consequently, both he and his accomplices escaped any punishment from human laws; but not the retributive justice of Providence, for this monster was shortly after washed off the deck of his ship, while proceeding round Cape Horn.

The governor forwarded to the home authorities the depositions of two scamen of the brig, to the same effect as the account already given, and those of Messrs. Montefiore and Kennis, merchants of Sydney, who had embarked on board the *Elizabeth* on her return to Entry Island, and had there learned the circumstances of the case, had seen the captive chief sent on shore, and had been informed that he was sacrificed.*

Another master of a trading vessel gave to a chief a packet of corrosive sublimate, wherewith to destroy his enemies.

One more feature remains to be noticed, as fearfully illustrative of the recklessness not only of the property, but even of the very lives of the New Zealanders, which marked the conduct of too many unprincipled Europeans. The natives had then

a custom of drying the tattooed heads (see engraving on map of New Zealand) of their deceased countrymen, some of which having been taken to Sydney, were bought up as objects of curiosity. From thence arose a loathsome species of traffic, which was carried to an extent that seems scarcely credible. Mr. Yate says that he has known people give property to the chiefs, for the purpose of getting them to kill their slaves, that they might have some heads to take to New South Wales. The practice was at length prohibited, in consequence of a representation made by the Rev. S. Marsden to Governor Darling, of the iniquitous manner in which ten heads just brought to Sydney and offered for sale by a Captain Jack, had been acquired.

Viscount Goderich (now Earl of Ripon), at that time Secretary of State for the colonies, in a despatch to Sir R. Bourke, governor of New South Wales, 31st of January, 1832, thus expresses the feelings of his Majesty's government with regard to the infamous conduct of the master of the *Elizabeth*, and other atrocities which had taken place in New Zealand:—

"It is impossible to read, *without shame and indignation*, the details which these documents disclose. The unfortunate natives of New Zealand, unless some decisive measures of prevention be adopted, will, I fear, be shortly added to the number of those barbarous tribes who, in different parts of the globe, have fallen a sacrifice to their intercourse with civilized men, who bear and disgrace the name of Christians. When, for mercenary purposes, the natives of Europe minister to the passions by which these savages are inflamed against each other, and introduce them to the knowledge of depraved acts and licentious gratifications of the most debased inhabitants of our great cities, the inevitable consequence is a rapid decline of population, preceded by every variety of suffering. Considering what is the character of a large part of the population of New South Wales and Van Diemen's Land, what opportunities of settling themselves in New Zealand are afforded them by the extensive intercourse which has recently been established, adverting also to the conduct which has been pursued in those islands by the masters and crews of British vessels, and finding from the letter of the Rev. Mr. Williams, that the work of depopulation is already proceeding fast, I cannot contemplate the too probable results without the deepest anxiety. There can be no more sacred duty than that of using every possible method to rescue the natives of those extensive islands from the further evils which impend over them, and to deliver our own country from the disgrace and crime of having either occasioned or tolerated such enormities."

The missionaries, on their part, watched with anxiety the state of affairs, feeling that if some steps were not speedily taken,

* General Darling's despatch to Lord Goderich, 13th April, 1831.

a serious collision would, in all human probability, arise, and could scarcely terminate otherwise than in the extermination, or at least expulsion, of one party or the other.

Desirous of maintaining the chiefs and their tribes as an independent people, and fearing, consequently, that France or some foreign power might assume the sovereignty of the islands, they beheld with deep regret the intestine warfare which was thinning the ranks of the aborigines, and rendering them less and less able to resist external aggression. As the best means of meeting these difficulties, they induced the leading chiefs to unite in seeking the protection of the King of England. Accordingly, in November, 1831, thirteen head chiefs of Paroa, Hokianga, Waimate, Kororarika, and other places, assembled at Keri-Keri, and signed an address, which they transmitted through Mr. Yate, secretary to the Church Missionary Society in New Zealand, to King William, "the gracious chief of England," of which the following is a literal translation:—

"KING WILLIAM,—We, the chiefs of New Zealand, assembled at this place, called the Keri-keri, write to thee, for we hear that thou art the great chief of the other side of the water, since the many ships which come to our land are from thee.

"We are a people without possessions. We have nothing but timber, flax, pork, and potatoes; we sell these things, however, to your people, and then we see the property of Europeans. It is only thy land which is liberal towards us. From thee, also, come the missionaries, who teach us to believe on Jehovah God, and on Jesus Christ, his Son.

"We have heard that the tribe of Marion* is at hand, coming to take away our land, therefore we pray thee to become our friend and the guardian of these islands, lest the teasing of other tribes come near to us, and lest strangers should come and take away our land.

"And if any of thy people should be troublesome or vicious towards us, (for some persons are living here who have run away from ships), we pray thee to be angry with them, that they may be obedient, lest the anger of the people of this land fall upon them.

"This letter is from us, from the chiefs of the natives of New Zealand."

Representations were forwarded, at the same time, from the Governor of New South Wales, suggesting the appointment of a person in the character of British resident at New Zealand, for the two-fold object of repressing acts of fraud and aggression practised by British subjects against the natives, and by acquiring a

* *La Favorite*, a French ship, anchored in the Bay of Islands about this period, and rumours were spread that the French government intended to take possession of the islands.

beneficial influence over the various chiefs, to protect the lives and properties of British subjects engaged in legitimate trade with the natives.

The result of these joint solicitations, was the compliance of the home government with the recommendation for the appointment of a Resident. Mr. J. Busby (a settler in New South Wales,) was selected for the position, and was accredited to the chiefs by being made the bearer of the royal answer to their address, dated the 14th of June, 1832. In it, Lord Goderich, in the name of King William IV., expressed his Majesty's sorrow for the injuries which the New Zealanders had sustained from some of his subjects, and his determination to do all in his power to prevent the recurrence of such outrages. His lordship likewise explained to them the protection to all classes which it was hoped would be afforded by the residence of Mr. Busby, and bespoke for that gentleman their zealous co-operation. This letter, and various presents from the king, were presented to the assembled chiefs by Mr. Busby, on his arrival in their country in May, 1833. The resident was placed on the civil-list of New South Wales, his salary of £500 a-year, and an annual allowance of £200 for disbursements to the natives, being provided from the resources of that colony; and instructions for his guidance were furnished by its governor.

From the whole tenor of these instructions, it is manifest how nearly nominal the authority entrusted to Mr. Busby must have been. General Bourke expressly reminds him, that *he cannot be clothed with any legal power or jurisdiction, by virtue of which he might be enabled to arrest British subjects offending against British or colonial law*; he adds, however, that as by the 9th Geo. IV., cap. 83, sec. 4, the Supreme Courts in New South Wales and Van Diemen's Island have power to enquire of, hear, and determine, all offences committed in New Zealand by the master and crew of any British ship or vessel, or by any British subject living there, and to punish the offenders,—the resident would be justified in taking cognizance of such offences, and if he thought "the case of sufficient magnitude and importance," might send a detailed report to New South Wales, by competent witnesses, upon whose evidence a bench-warrant having been obtained for the apprehension of the offender, would be

transmitted to him (Mr. Busby) for execution. The governor adds, "you will perceive, at once, that this process, which is at best, but a prolix and inconvenient operation, and may incur some considerable expense, will be totally useless, unless you should have some well-founded expectation of securing the offender upon or after the arrival of the warrant, and of being able to effect his conveyance here for trial, and that you have provided the necessary evidence to ensure his conviction."

Mr. Busby was further desired to "use his discretion" in causing the apprehension and removal of such escaped convicts as might be within his reach, or were guilty of any offence against the peace and tranquillity of the country; but as these same offenders were supposed to be from 100 to 200 in number, the resident used his discretion by letting them alone. He was instructed, likewise, to endeavour to mediate officially between rival chiefs or hostile tribes; to counsel the establishment of some system of jurisprudence; to furnish occasional returns concerning the agriculture, commerce, and general statistics of the islands, together with full and frequent shipping reports. Lastly, he was desired to evince cordial co-operation with the missionaries in the great objects of their solicitude, the extension of Christian knowledge throughout the islands, and the consequent improvement in the habits and morals of the people.* Had the Resident acted more cordially in the spirit of this last injunction, he might, as an accredited representative of the British government, have exercised over a large number of the natives, and over some at least of the more respectable settlers, a considerable amount of moral influence; as it was, he appears to have been regarded by all parties as a "man-of-war without guns," and openly set at defiance by the dissolute class whose excesses he was expressly sent to restrain.

Shortly after his arrival, Mr. Busby applied to Governor Bourke to authorize the adoption of a national flag by the New Zealanders, and to advise that ships built in the island, and registered by the chiefs, should have their registers respected in their intercourse with British possessions. Sir R.

Bourke, in compliance with this request, sent three pattern-flags for the chiefs to choose from. The one selected by them was hoisted, inaugurated, and saluted with twenty-one guns by the *Alhigator*, a British ship of war then at anchor in the Bay of Islands. An account of these proceedings, dated April, 1834, was transmitted by the governor of New South Wales to the home authorities: Lord Aberdeen, in reply, (dated Dec. 1834,) approved of them in the name of the king, and stated that the Admiralty had instructed their officers to give effect to the New Zealand Registers, and to acknowledge and respect the national flag of that country.

In this year a distressing affair took place, the leading circumstances of which it may be necessary to mention. At the end of April, 1834, the *Harriet* (whaler), J. Guard, master, was wrecked at Cape Egmont, but the whole crew succeeded in effecting a landing in the boats. The natives plundered the wreck (as the Cornish men would probably have done on our own coast not very many years ago), but offered no violence to the passengers for ten days, during which interval two of the seamen deserted to a native pah or stockaded village. A fray then commenced, in which twelve of the sailors, and between twenty and thirty of the New Zealanders were killed. Mrs. Guard, and her two children, were taken prisoners, her husband and the rest of his party retreated, but prudently surrendered themselves to another tribe whom they met, who finally allowed the captain to depart, on his promising to return and bring a ransom of gunpowder for the nine seamen retained as hostages: three of the chiefs accompanied him to Sydney.

Guard, who is stated to have been formerly a convict,† a man of violent character, and some of whose previous dealings with the natives between 1823 and 1834, would appear to have been in keeping with his avowed opinion, that "a musket-ball for every New Zealander was the best mode of civilizing the country;‡ expressed no dread for the safety of his wife and family, nor of the men left in bondage to the Mataroa tribe, and was quite confident that a pound of tobacco and a blanket or two

* Instructions from Governor Sir R. Bourke to Mr. Busby, dated Sydney, 13th April, 1833, House of Commons' Papers, presented by her Majesty's commands, in pursuance of address of 8th April, 1840. Pages 4 and 5.

† Vide Dissent of C. D. Riddell, Esq., Colonial Treasurer, to proposed expedition.—Parliamentary Papers, 585, p. 5.

‡ See Report of Aborigines Committee in 1837, p. 20.

would be considered as a sufficient ransom for each of them: something more, perhaps, would be required for his wife and children.

Notwithstanding this, the authorities of New South Wales deemed it advisable, without any communication with Mr. Busby, or the missionaries, whose influence might here have been most usefully employed, to send the *Alligator* frigate and the schooner *Isabella*, with a company of the 50th regiment, to recover Mrs. Guard and the other captives. According to the general account of this expedition given in the Parliamentary Papers on New Zealand in 1835 (No. 585), and the report of the Aborigines Parliamentary Commission in 1836-7, more especially from the evidence of Mr. Marshall, the assistant-surgeon of the *Alligator*, who was sent on shore with the troops and seamen; it would appear to have been marked on the part of the English by wanton cruelty and even treachery. Mrs. Guard and one child were restored unhurt on the 30th of September, and on the 8th of October, the other was brought on the shoulders of a chief, who, by its mother's testimony, had protected and adopted it; yet on hesitating to deliver up the boy without the promised ransom, the child was forcibly taken from him, and the Chief was killed upon the spot. Finally, after every prisoner had been delivered up, uninjured, two of the native villages were burned to the ground. The parliamentary committee express their regret at this painful, and I must add, exceedingly discreditable transaction, and justly declare, that "the impression left with that tribe of savages must have been one of extreme dread of our power, accompanied with one of deep indignation."

In communicating to his Majesty's government intelligence of this melancholy affair, Sir R. Bourke, governor of New South Wales, and the Executive Council of the colony, represented the urgent necessity of having a ship of war *permanently* stationed in the southern seas for the protection of

British and colonial commerce, and the repression of the numerous outrages so frequently committed both by Europeans and natives. Unless this were done, and an act of Parliament passed, empowering the British Resident in New Zealand, to apprehend and commit for trial in New South Wales, his Majesty's subjects offending against British law, the governor deemed it would be more creditable at once to withdraw the Resident, and announce to the English residing in New Zealand, that they were altogether without the pale of British protection.

We now arrive at a point in the history of New Zealand, frequently discussed and variously viewed, namely, the DECLARATION OF INDEPENDENCE by the native chiefs.

The immediate cause of this measure appears to have been, the alarm with which Mr. Busby was inspired, on receiving from an individual styling himself "Charles, Baron de Thierry,* Sovereign Chief of New Zealand, and King of Nuhahiva," (one of the Marquesas Islands,) a formal declaration of his intention to establish in his own person an independent sovereignty in New Zealand, in virtue of an invitation given to him in England by E'ongi and other chiefs, and also on the grounds of an alleged purchase for him, in 1822, by Mr. Kendal, of three districts on the Hokianga river; the baron stated that he had declared his intentions to the Kings of Great Britain and France, and to the President of the United States, and that he was then waiting at Otaheite the arrival of an armed ship from Panama, to enable him to proceed to the Bay of Islands.

On receipt of this grandiloquent effusion, the effect of which was doubtless aided by the fear of some hidden design on the part of the French government, Mr. Busby issued an official address to his countrymen in New Zealand, (dated Bay of Islands, 10th October, 1835,) wherein he informed them of the purport of the Baron's communication; and, after adverting to the elaborate

* De Thierry was the son of a French emigrant nobleman: he was educated at Cambridge university, whither Mr. Kendall, one of the early Church missionaries, went in 1820, accompanied by E'ongi, and another chief, to obtain the assistance of Professor Lee in compiling a vocabulary of the New Zealand language. Here they met De Thierry, who, it would appear (for the statements concerning this transaction, which I have been able to obtain, are very vague), commissioned Mr. Kendall to purchase for him a tract of land in New Zealand. On his return, Mr. Kendall is stated to have forwarded to De Thierry a (so-called) title-deed of certain dis-

tricts, situate near the Hokianga river, "for and in consideration of thirty-six axes." Mr. Kendall's conduct in this affair seems inexplicable, unless he were actuated by interested motives. According to Dr. Lang, the land claimed by De Thierry was bought *of*, and not *through*, Mr. Kendall, to whom it had been presented by the natives, on condition of his taking up his abode with them. This he did not do; for he left the Church Mission, and settled in New South Wales, where he died, being drowned in a small coasting vessel, when bound, with a load of cedar, from his farm at Kiama (on the east coast to the southward) to Sydney.

exposition of the views of the said Baron, addressed to the Church missionaries, to each of whom he offered a salary, on consideration of their acting as magistrates, and to the ample promises to all persons, whether Europeans or natives, who should consent to live under his government (of which the outline or programme was very cleverly drawn up); Mr. Busby stated his intention of taking "immediate steps for calling together the native chiefs, in order to inform them of this proposed attempt on their independence, and to advise them of what is due to themselves and to their country, and of the protection which British subjects are entitled to at their hands;" the Resident added, that he had "no doubt that such a manifestation would be exhibited of the characteristic spirit, courage, and independence of the New Zealanders, as would stop, at the outset, such an attempt upon their liberties, by demonstrating its utter hopelessness."

A week after the issue of the above address, by Mr. Busby, the following DECLARATION OF INDEPENDENCE was adopted and subscribed by thirty-five chiefs residing in the northern portion of New Zealand, and witnessed by Mr. H. Williams and Mr. George Clarke, missionaries, and by Messrs. Clendon and Mair, merchants:—

"1. We, the hereditary chiefs and heads of the tribes of the northern parts of New Zealand, being assembled at Waitangi, in the Bay of Islands, on this 28th day of October, 1835, declare the independence of our country, which is hereby constituted and declared to be an independent state, under the designation of '*The United Tribes of New Zealand*.'

"2. All sovereign power and authority within the territories of the united tribes of New Zealand, is hereby declared to reside entirely and exclusively in the hereditary chiefs and heads of tribes in their collective capacity; who also declare that they will not allow any legislative authority separate from themselves in their collective capacity to exist, nor any function of government to be exercised within the said territories, unless by persons appointed by them, and acting under the authority of laws regularly enacted by them, in congress assembled.

"3. The hereditary chiefs and heads of tribes agree to meet in congress at Waitangi in the autumn of each year, for the purpose of framing laws for the dispensation of justice, the preservation of peace and good order, and the regulation of trade; and they cordially invite the southern tribes to lay aside their private animosities, and to consult the safety and welfare of our common country, by joining the confederation of the united tribes.

"4. They also agree to send a copy of this declaration to his Majesty the King of England, to thank

* Sir George Gipps (the successor of Sir Richard Bourke), in a despatch dated August, 1840, speaks of this declaration as entirely a measure of Mr. Busby's

him for his acknowledgment of their flag; and in return for the friendship and protection they have shown, and are prepared to show, to such of his subjects as have settled in their country, or resorted to its shores for the purposes of trade, they entreat that he will continue to be the parent of their infant state, and that he will become its protector from all attempts upon its independence.

"Agreed to unanimously, on this 28th day of October, 1835, in the presence of his Britannic Majesty's Resident."

Mr. Busby* transmitted to England a copy of the above declaration. Lord Glenelg, in his despatch to Sir Richard Bourke, May, 1836, acknowledges the receipt of this communication, but expresses no opinion upon it; merely stating, in guarded terms, that—

"With reference to the desire which the chiefs have expressed on this occasion to maintain a good understanding with his Majesty's subjects, it will be proper, that they should be assured, in his Majesty's name, that he will not fail to avail himself of every opportunity of showing his good-will, and of affording to those chiefs" (i. e., the chiefs who had signed the declaration) "such support and protection as may be consistent with a due regard to the rights of others, and the interests of his Majesty's subjects."

It may be as well to state here, that the dreaded Baron de Thierry, who seems to have been rather a crotchety enthusiast than a knavish schemer, did not arrive in New Zealand until 1837, having touched at Sydney, on his way thither, and induced a number of mechanics and labourers to accompany him to his estate at Hokianga. The chiefs laughed at his "sovereign rights and powers," and disavowed his territorial claims on various grounds, although they admitted (with regard to the latter), that some transaction had taken place; but they maintained that no chief could dispose of land belonging to his tribe, without the consent of every member, each individual having as it were a vested interest in it. (Ignorance or wilful disregard of this fundamental law of property among the New Zealanders, lies at the root of the perplexing and almost hopelessly involved land claims.) At length a limited grant was made to De Thierry, by Nene (one of the chiefs of whom the extensive purchase above referred to was stated to have been made) and his tribe; and there the Baron eventually settled down, with no other retainers than his immediate family; the sixty persons who had accompanied him from Sydney having returned thither, or concoction, and designates it "a silly as well as an unauthorized act; a paper pellet fired off at the Baron de Thierry."

sought employment elsewhere, on finding the utter fallacy of the expectations which he had led them to entertain. Of these, some were supported solely by the charity of the missionaries.

The extent of the native population of the Northern Island, about this period, is thus stated in a letter from the Rev. W. Williams to the Church Missionary Society, dated February, 1834:—

"I believe the population of this island does not exceed 106,000, of which about 4,000 are in connexion with our station at Kailaia, to the northward, 6,000 with the Wesleyan station at Hokianga, and 12,000 connected with our four stations in the Bay of Islands. The number in the Thames is about 4,800; while those at Waikato, a district in the same parallel with the Thames, and on the western coast, are about 18,000. Along the coast of the Bay of Plenty, as far as Hick's Bay, are about 15,600. From Hick's Bay to Hawke's Bay the number is about 27,000, concentrating in two principal places. There are now no other inhabitants in the southern part of the island, except in the neighbourhood of Entry Island, where the number is about 18,000."

In a letter written the 4th of September, 1835, Mr. Williams says, "the population of the two islands is small, not exceeding 200,000."

To return to the Declaration of Independence. If the intercourse of the New Zealanders could have been restricted to the ministers, catechists, and respectable settlers, they might, by the *conjoined counsels* of a British Resident and the missionaries, have been gradually induced to form an effective confederation among themselves; and that important point once gained, there is little doubt that this fine and intelligent race would have acquired, in no long time, the art of self-government.

But any such restriction was manifestly impossible; and even had it been practicable, the unfortunate differences which existed between Mr. Busby and the missionaries, especially as regarded the sale of ardent spirits, of which the natives were fully aware, would have greatly detracted from the beneficial influence which a different person might, in his position, have exercised.

In the following year (1836), no fewer than ninety-three British, fifty-four American, and three French vessels visited the Bay of Islands; and the desultory colonization at various spots along the coast

likewise increased; until, "about the commencement of 1838, a body of not less than 2,000 British subjects had become permanent inhabitants of New Zealand."*

The evils of continued anarchy became more aggravated; and a petition to the crown for protection was drawn up and signed by thirty-six missionaries and catechists, and the most respectable settlers, in which it was stated—

"That it had been considered that the confederate tribes of New Zealand were competent to enact laws for the proper government of this land, whereby protection would be afforded in all cases of necessity, but experience evidently shews that in the infant state of the country, this cannot be accomplished or expected; it is acknowledged by the chiefs themselves to be impracticable."

In 1836-7, an inquiry materially affecting the interests of the New Zealanders, in common with various other aboriginal races, was entered upon by the Imperial Parliament. The attention of the British public having been directed to the subject by the philanthropic efforts of the Christian missionary societies, and of an excellent association formed expressly for the protection of aborigines, a select committee was "appointed to consider what measures ought to be adopted with regard to the native inhabitants of countries where British settlements are made, and to the neighbouring tribes, in order to secure to them the due observance of justice, and the protection of their rights." After hearing numerous witnesses, and recording much valuable but very distressing information, (some of which has been already quoted from this valuable report—see p. 126), the committee thus recapitulate the evils which have resulted from the intercourse between civilized and barbarous nations:—

"That Europeans coming in contact with native inhabitants of our settlements, tend (with the exception of cases in which missions are established) to deteriorate the morals of the natives; to introduce European vices; to spread among them new and dangerous diseases; to accustom them to the use of ardent spirits; to the use of European arms and instruments of destruction; to the seduction of native females; to the decrease of the native population; and to prevent the spread of civilization, education, commerce, and christianity; and that the effect of European intercourse has been, upon the whole, a calamity on the heathen and savage nations."

The committee proceed to state, that these

penal settlements, or seamen who had deserted their ships; and these people, unrestrained by any law, and amenable to no tribunals, were alternately the authors and the victims of every species of crime and outrage."

* Vide Lord Normanby's despatch to Captain Hobson, August, 1839. His lordship adds—"Amongst them were many persons of bad and doubtful character—convicts who had fled from our

allegations have been clearly proved by the evidence received, and add—

"We have also seen the effects of conciliatory conduct, and of christian instruction. One of the two systems we must have to preserve our own security, and the peace of our colonial borders; either an overwhelming military force, with all its attendant expenses, or a line of temperate conduct, and of justice towards our neighbours."

Several valuable suggestions are likewise offered in the report, of which those most applicable to New Zealand are, that—

"It should be made known to all governors of her Majesty's colonies, that they are forbidden by her Majesty to acquire in her name any accession of territory, either in sovereignty or in property, without the previous sanction of an act of Parliament;" and likewise, "that in cases where it may be impracticable to prevent the acquisition of lands," (not forming a part of the Queen's dominions), "by British subjects; it should be distinctly understood, that all persons who embark in such undertakings, must do so at their peril, and have no claim on her Majesty for support in vindicating the titles which they may so acquire, or for protecting them against any injury to which they may be exposed in the prosecution of any such undertakings."

The conclusion of the report I quote, as embodying not only the opinions of the committee (among whom were Sir J. F. Buxton, Sir George Grey, Mr. Gladstone, Mr. Pease, Mr. Hindley, and other men distinguished for their exertions in the cause of their fellow-creatures of every clime and colour), but also, as I believe, expressing likewise the feelings of her Majesty's government, and of the intelligent and really Christian portion of the British public in all quarters of the globe:—

"The oppression of the natives of barbarous countries is an evil of comparatively recent origin, imperceptible and unallowed in its growth; it *never has had even the colour of sanction from the legislature of this country; no vested rights are associated with it*, and we have not the poor excuse that it contributes to any interest of the state. On the contrary, in point of economy, of security, of commerce, of reputation, it is a short-sighted and disastrous policy. As far as it has prevailed, it has been a burthen on the empire. It has thrown impediments in the way of successful colonization; it has engendered wars, in which great expenses were necessarily incurred, and no reputation could be won; and it has banished from our confines, or exterminated, the natives who might have been profitable workmen, good customers, and good neighbours. These unhappy results *have not flowed from any determination on the part of the government of this country to deal hardly with those who are in a less advanced state of society*; but they seem to have arisen from ignorance, from the difficulty which distance interposes in checking the cupidity and punishing the crimes of that adventurous class of Europeans who lead the way in penetrating the territory of uncivilized man, and from the system of dealing with the rights of the natives. Many reasons unite for apprehending that the evils

which we have described will increase if the duty of coming to a solemn determination as to the policy we shall adopt towards ruder nations be now neglected; the chief of these reasons is, the national necessity of finding some outlet for the superabundant population of Great Britain and Ireland. It is to be feared that, in the pursuit of this benevolent and laudable object, the rights of those who have not the means of advocating their interests, or exciting sympathy for their sufferings, may be disregarded.

"This, then, appears to be the moment for the nation to declare, that with all its desire to give encouragement to emigration, and to find a soil to which our surplus population may retreat, it will *tolerate no scheme which implies violence or fraud in taking possession of such a territory; that it will no longer subject itself to the guilt of conniving at oppression, and that it will take upon itself the task of defending those who are too weak and too ignorant to defend themselves.*

"Your committee have hitherto relied chiefly on arguments, showing that no national interest, even in its narrowest sense, is subserved by encroachments on the territory, or disregard of the rights of the aboriginal inhabitants of barbarous countries; but they feel it their duty to add, that there is a class of motives of a higher order which conduce to the same conclusion.

"The British empire has been signally blessed by providence; and her eminence, her strength, her wealth, her prosperity, her intellectual, her moral, and her religious advantages, are so many reasons for peculiar obedience to the laws of Him who guides the destinies of nations. These were given for some higher purpose than commercial prosperity and military renown. 'It is not to be doubted that this country has been invested with wealth and power, with arts and knowledge, with the sway of distant lands, and the mastery of the restless waters, for some great and important purpose in the government of the world. Can we suppose otherwise than that it is our office to carry civilization and humanity, peace and good government, and, above all, the knowledge of the true God, to the uttermost ends of the earth?'" He who has made Great Britain what she is, will inquire at our hands how we have employed the influence He has lent to us, in our dealings with the untutored and defenceless savage; whether it has been engaged in seizing their lands, warring upon their people, and transplanting unknown disease and deeper degradation through the remote regions of the earth; or whether we have, as far as we have been able, informed their ignorance, and invited and afforded them the opportunity of becoming partakers of that civilization, that innocent commerce, that knowledge and that faith with which it has pleased a gracious providence to bless our own country."

Meanwhile, in spite of all discouragements, missionary labour prospered in New Zealand. In 1837, the Rev. Mr. Marsden,† then considerably advanced in years, paid his last visit to the people whose best interests he had laboured so long and so zealously to promote. Writing to the

* The Rev. Mr. Whewell's Sermon before the Trinity Board.

† Mr. Marsden died in 1848, having been forty-four years chaplain of New South Wales.

Church Missionary Society, he says—"Since my arrival, I have visited many of the stations within the compass of 100 miles, and have observed a wonderful change has taken place within the last seven years. The portions of the sacred Scriptures which have been printed have had a most astonishing effect. Great numbers have been baptized, both chiefs and people. I consider the missionaries, as a body, very pious, prudent, and laborious men, and that they and their children are walking in the admonition of the Lord." Mr. Marsden bears forcible testimony to the want of any authority or rules for their direction felt by the natives, and offers in illustration of it a letter addressed to him by a powerful chief, the successor of E'ongi, of which the following is a literal translation :—

"Sir,—Will you give us a law? This is the purport of my address to you. If we say, let the cultivations be fenced, and a man through laziness does not fence, should pigs get into his plantation, is it right for him to kill them? Do you give us a law in this matter. Again,—should pigs get into fenced land, is it right to kill, or rather to tie them till the damage they have done is paid for? Will you give us a law in this? Again,—should the husband of a woman die, and she afterwards wishes to be married to another, should the natives of unchanged heart bring a fight against us, would it be right for us to stand up to resist them on account of their wrongful interference? Will you give us a law in this also? Again,—in our wickedness, one man has two wives, but after he has listened to Christ, he puts away one of them, and gives her to another man to wife. Now should a fight be brought against us, and are we, in this case, to stand up to fight? Give us a law in this. Again,—should two men strive one with the other? Give me a law in this. My (ritenga) law is to collect all the people together, and judge them for their unlawful fighting, and also for wrongfully killing pigs. Therefore I say, that the man who kills pigs, for trespassing on his plantation, having neglected to fence, had rather pay for the pigs so killed. Will you give us a law in this? Fenced cultivations when trespassed on, should be paid for. These only are the things which cause us to err;—women, pigs, and fighting one with another. But here is another,—should a man who is in the church come in a fight against us? Give us a law in this. Another thing, which we are afraid of, and which also degrades us, is this, slaves exalting themselves above their masters. Will you give us a law in this also?"

About this time, an evil which threatened not only to deprive the Maories of their independence as a nation, but to reduce them to speedy and abject poverty, attained an alarming magnitude. The "land fever," in its different phases of "sharking," "jobbing," and *bona fide* speculation, literally raged in New Zealand. What gold was to the Spaniards in Mexico, land at this period became to the English

in these islands—and, as the warlike aborigines most coveted the acquisition of fire-arms, they divested themselves of their only possessions, in order to obtain those deadly instruments which, together with ardent spirits, were the most potent means for the destruction of their race. Almost every captain of a ship, on arriving at Sydney, exhibited a piece of paper with a tattooed native head rudely drawn on it, which he described as the title-deed of an estate, bought for a few muskets, hatchets, or blankets; and as the government had fixed a price of 5*s.*, and afterwards 12*s.*, per acre on land in Australia, adventurers crowded to New Zealand, hoping there, under cover of the Declaration of Independence, to pursue their schemes with impunity. The extent to which the land mania prevailed, may be best understood by the fact, that when to the claims of various associations and private individuals, came to be added the enormous ones of the New Zealand Company, the total area of the islands, including rocks, mountains, and swamps, would have been quite insufficient to satisfy them. A Mr. Webster declared himself to have purchased forty miles of frontage on the west side of the river Piako; a Mr. Painham claimed nearly the whole of the north coast of the Northern Island; Mr. Wentworth, of New South Wales, asserted his right to 20,100,000 acres in the Middle Island; Catlin and Co., 7,000,000; Weller and Co., 3,557,000; Jones and Co., 1,930,000; Peacock and Co., 1,450,000; Green and Co., 1,377,000; Guard and Co., 1,200,000; and New Zealand Company, 20,000,000.*

Jamieson, in his instructive work (p. 174), says :—"One company, consisting of four gentlemen, claimed the Middle Island, in consideration of giving the chiefs a few hundred pounds in money and merchandize, and a life annuity of £100 per annum. Another individual, representing a commercial firm in Sydney, laid claim to several hundred thousand acres, including the township of Auckland, for which he gave one keg of gunpowder."

Five parties declared they had each purchased Kapiti, or Entry Island, in Cook's Strait, some for £100, some for goods to the value of £30; all produced the signatures of the chiefs, Rauperaha and Rangibaeta. Porirua district was claimed by eight separate parties, who each declared

* See speech of Hon. Capt. Rous, M.P. in the Debate on New Zealand, 1845.

they had bought the place from Rauperaha and others. Cooper, Holt, and Rhodes, of New South Wales, asserted that they paid merchandize to the value of £150, in 1839, for a tract of country between the Otaki and Waikanahi rivers, running in an easterly line forty miles from the mouth of the latter river, thirty miles in another direction, ten miles along the coast, and so on. Mr. John Hughes, of Sydney, claimed, in part, all the lands of Porirua for a distance of thirty miles, bounded by a range of snowy mountains.

In this unseemly scramble for land, the Resident and the missionaries are accused of having participated. Mr. Busby certainly appears to have become a purchaser to the extent of 48,150 acres, claiming, according to Dr. Dieffenbach, the neck of land which separates Waitangi from the Keri-Keri, in the neighbourhood of the Waimate Mission. In his peculiar position, this was unquestionably an injudicious proceeding, although, according to the evidence adduced by his brother, Mr. A. Busby, before the Select Committee of the Lords, in 1840, his "extensive purchases" were made after "hearing of his removal from office." With reference to the missionaries, as individuals, the accusation can refer only to the members of the Church Mission, as the Wesleyans (with one exception*) have never effected purchases, being prohibited from doing so by the fundamental rules of their society, which differ from those of the Church Mission, in this point, especially; that whereas the members of the former body are at liberty to apply for leave to return, with their families, to their native country, after a limited period of service in a foreign land; those of the latter are, on the contrary, expected to take up their permanent abode among the people to whom they are destined to minister; and as parents, they consider themselves simply performing their duty to their children, by making prospective arrangements for their establishment in life.

In a recent work, entitled *The New Zealand Question*, by L. A. Chamerovzov, some pertinent remarks are made on this subject, p. 266:—

"Much censure, very undeserved in our opinion, has been cast upon the Church missionaries in consequence of their acquisition of land, but it is estab-

* Mr. White, who was dismissed from the society in 1836, made large purchases and settled in New Zealand.

lished that at least they paid for what they contracted for, and at a tolerably equivalent rate. For instance, their chief purchases consisted of land partially exhausted by native culture, and, in the opinion of the natives themselves, 'worn out,' now the parliamentary evidence proves that for this, they paid at the rate of 3s. 4d. per acre. But, after all, the whole extent of claim made on behalf of the Church Mission families, save two exceptional cases resting on peculiar grounds, originally amounted to only 53,000 acres; the children of these families (twelve in number) are 120, being an average of 446 acres per each child, which the land commissioners have reduced to 243, having awarded 29,209 acres in all. Let it now be taken into consideration that the missionaries bought the land when the prospect of colonization was, to say the least of it, very remote; that they could make no other provision for their families in that savage land, and that this provision was a poor set-off against their deprivation of the advantages of civilized society. It does then appear too harsh to censure these worthy men as land-jobbers, and unjust to decide their claims by the ordinary rule; for, even admitting that they had acquired a title to their full claim, namely, at the rate of 446 acres per each child, their claim, founded upon fair purchase, would fall far short of the allowance made by government to the chaplains of the colony of New South Wales, who receive, as a free gift, for each of their children, at the average rate of 1,600 acres."

The exceptional cases above referred to are, I presume, those of Mr. Fairburn and the Rev. R. Taylor. Mr. Fairburn claimed 40,000 acres, and in a letter to the Church Missionary Society, dated November, 1838, thus explains the circumstances which led him to become a purchaser to so large an extent.

"In January, 1836, Mr. Williams arrived at the Puriri, with a few of the Ngapuhi chiefs from the Bay of Islands, to endeavour to effect the establishment of peace between the Waikato and the Thames; which object having been accomplished, and the boundaries of the land settled between the two parties, the Thames natives immediately made application to sell at once their portion of land joining on to that of the Waikato; declaring that peace could not exist for any length of time unless they did so, as there would be perpetual infringements on each other's territories. About a week afterwards the natives came in a body, and almost insisted that the land should be purchased."

On acquiring the tract in question, Mr. Fairburn made over by deed one-third to the aborigines. Subsequently he assigned another third to the Church Missionary Society, for the benefit of the mission, and kept the remaining third for his own use. The society considered the extent retained by him disproportionate to the reasonable requirements of himself and his family, and he consequently retired from their service. By the Court of Land Claims he was eventually allowed 3,695 acres.

Mr. Taylor's claim extended to 50,000 acres. The quantity allowed to him by

the Commissioners was 2,726. The following explanations relative to this purchase were addressed by him to the Church Missionary Society's Committee, August 8th, 1843:—

"In a former letter I sent an account of the land I have purchased at the North Cape. As the Society has again written on the subject, I shall mention the same again, lest the former should not be received; but as for particulars I scarcely know how to give them, except that I purchased of Noble and his tribe a tract of land from which they had expelled the Aupouri, a northern tribe, nearly twenty years before. My object was to have given that tribe power to return to their former homes, which I could not have done without purchasing that land. This is stated in my deed of purchase, and a large portion of that tribe, amounting to nearly 100, has already taken up its abode there. Relative to the land which I shall claim for myself, I shall be satisfied with retaining sufficient to cover my outlay; but I have not selected any yet. I have only once seen it, and perhaps may never see it again. It is not a fertile district, a large portion being covered with moving sand-hills, and the whole is destitute of timber. I have given about £140 in cash; and although I thought my motive was a laudable one, yet after what has been said about missionaries and land, I regret I ever made it."

Another important point which should be kept in mind, with regard to the extent of land purchased by the Church Missionaries, for their families, is, that only a limited portion of it was available for agriculture. Archdeacon Williams says:—

"When a native wished to dispose of land, he required that the bad should be taken as well as the good, and hence it has generally happened, that while the number of acres may sound large, there is, in reality, but a small portion which is fit for agricultural purposes. Hence, therefore, if 200 acres of good land be no more than a sufficient quantity, much more than 1,000 is generally required to ensure the possession of 200. I know of some thousands which have been purchased, which will not average 100 acres of available land in each thousand."

But if the aspersions cast upon the conduct of individual missionaries, with regard to the acquisition of land, have been, as I truly believe, with few—very few exceptions—censorious and unjust; they were yet more unwarrantable, when applied either to the Church or Wesleyan Mission, as a body. The one sole cause of offence ever given by these two influential societies was the unwavering and uncompromising opposition which they united in maintain-

* Their objections to colonization in general, but more especially to the plan proposed by the New Zealand Association (afterwards the New Zealand Company), are clearly and briefly stated in two pamphlets; the one entitled *The Principles, Objects, and Plan of the New Zealand Association Examined*, by Mr. Coates, the lay secretary of the Church Mission; the other, by the Rev. Mr. J. Beccham, secre-

ng to all projects for the colonization of New Zealand,* as subversive of the rights, and injurious to the interests, both temporal and spiritual, of the people, to whom they were attached by the strong tie which binds the protector to the protected. It is gratifying to perceive, that their conscientious motives were appreciated by his Majesty's government, and that, notwithstanding the opposite views entertained in various quarters, their opinions were listened to with respect, as coming from men "who had borne the burden and heat of the day," and whose disinterested exertions through a long series of years, had alone rendered New Zealand an attractive field for emigration. Notwithstanding the eminent service they had done to the cause of Christian civilization, the missionaries were scoffed at and vilified by the interested schemers whose object was to decry their labour and reap its fruits. The Church Missionary Society took an excellent mode of refuting these wanton calumnies, by requesting the Bishop of Australia to visit the missions in New Zealand, and examine personally the different stations, and the numbers and condition of the converts. Bishop Broughton accordingly proceeded thither towards the close of 1838; his high testimony, as also that of the Rev. Samuel Marsden, in 1837 (to which I have before referred), is given at length in the Parliamentary Papers of the 3rd of August, 1840, pp. 170-1-2. In addressing the London Committee of the Church Missionary Society, his Lordship says:—

"It is in my power, I think, effectually to contradict the assertions of the adversary and of the scoffer, who have sometimes gone the length of affirming that the attempt to christianize the people of this nation has been a failure—that nothing has been done." . . . "At every station which I personally visited, the converts were so numerous, as to bear a very visible and considerable proportion to the entire population."

The candidates for confirmation were carefully questioned,—

"The grey-haired man and the aged woman took their places to read and to be examined, among their descendants of the second and third generations; the chief and the slave stood side by side, with the same holy volume in their hands, and tary to the Wesleyan Mission. Both these gentlemen ably and consistently advocated the views entertained by the societies to which they respectively belonged, and maintained throughout much long and arduous discussion, a Christian tone of feeling and expression, which could not but gain the respect of all good men.

exerted their endeavours each to surpass the other in returning proper answers to the questions put to them, concerning what they had been reading."

These assemblages took place sometimes in the open air, but generally in a building set apart by the natives in each pah or native village; the Bishop says he encouraged them on all occasions, to probe the extent of the attainments and improvements of the converts. He adds, that the lay catechists, as well as the clergy, were "all animated by a good spirit, and a desire, according to their several abilities, to work the work of God."

To return to the land question, on the part of the Church Mission, 11,600 acres were claimed. This might at first sight seem excessive, were it not a well known fact that the society had no private interest whatever in holding land,* but simply desired to make proper provision for buildings, gardens, and agriculture, for the use of the missionaries, and for the maintenance of the natives connected with their various stations. Their expenditure in New Zealand in 1836 was no less than £13,000; the total cost from the commencement of their operations to the present time amounts to the sum of £273,000 on that mission only. In 1839-40 they had established chapels and schools at Tepuna, Keri-Keri and Wangaroa, Paihia, Waimate, and Kaitia, in the northern part of the island; and at Entry Island, Poverty Bay, Rotorua, Tauranga, Hauraki, and Manukan, in the southern portion. The number of schools at these several stations was eighty-three; the scholars were in all, 2,562. The congregations regularly attending Divine worship were 4,644, the communicants 284.

A farm was established at the *Waimate*, expressly for the encouragement of agriculture among the natives, for their exclusive benefit.

The extent to which spiritual instruction was carried on by European and native catechists at this period is shown in the diffusion of the Church of England Prayer-book and Hymns to the number of 33,000 copies, and in the demand from the London directors for an additional 10,000 copies of the New Zealand Testament, printed in the Maori language. At the Bay of Islands, Mr. Mair states that he could have readily

* By a resolution adopted by the Church Missionary Society, in 1841, the whole of their land in New Zealand was "appropriated to endow or aid the endowment of a parochial ministry, of a bishopric, if necessary, and of educational and

purchased a cargo of corn, if he had had a number of the small Prayer-books circulated by the mission. The land purchased for the Wesleyan Mission in the course of seventeen years, up to July, 1840, in various places where they had established missions, was altogether only 850 acres, and the price paid for the land averaged from *four to five* shillings per acre. At Mangungu, on the Hokianga (their oldest station), they paid £189 10s. for a waste and thickly wooded tract, then comparatively valueless. The land held and tilled by the society did not support the mission; the annual charge on the funds derived from charitable contributions in England was, in 1838, £3,617; in 1839, £3,885; and in 1840, about £4,000.

In 1839, they had stations at Mangungu, Waima, Newark, Orongatta, Kaipara, Heads of Kaipara, Kawia, Waingaroa, Taranaki, and Kapiti. The communicants and scholars amounted to 1,763. Their expenditure on the New Zealand Mission, up to 1848, amounted to upwards of £80,000.

A Roman Catholic Mission was established in 1838, when Monseigneur Pompallier, the bishop arrived, with a priest and catechist; a circumstance deeply to be regretted, because it could not but tend to unsettle and distract the minds of the newly converted heathens, and was besides calculated to rouse a spirit of controversy on points not absolutely necessary to salvation, in the minds of the Church and Wesleyan missionaries.

Having thus endeavoured to afford the reader some idea of the spiritual condition of New Zealand at this important epoch of its history, I now return to its secular affairs.

In the month of May, 1837, Sir R. Bourke, governor of New South Wales, while awaiting the receipt of a promised parliamentary enactment relative to these islands, heard that a war had broken out between two tribes in the vicinity of the Bay of Islands, by which the safety of the British inhabitants, and of the shipping, was endangered. He thereupon sent Captain Hobson, then commanding H.M.S. *Rattlesnake*, as an experienced and judicious officer, for their protection, at the same time desiring him to report his opinions "on the present state of New Zealand, and collegiate establishments; and for other objects of permanent benefit to the natives."—See *Statement of the Church Missionary Society, in reference to the Land purchased by their Missionaries, 1845*

the means of procuring, with the least possible overt interference, the common interests of the natives and of the British settled amongst them."*

This request was complied with by Captain Hobson in an able document, dated August, 1837, wherein, after adverting to the decrease of the natives, and the simultaneous increase of the British subjects, he speaks of the latter as every day acquiring considerable possessions of land; and adds,—

"Heretofore the great and powerful moral influence of the Missionaries has done much to check the natural turbulence of the native population; but the dissolute conduct of the lower orders of our countrymen not only tends to diminish that holy influence, but to provoke the resentment of the natives, which, if once excited, would produce the most disastrous consequences. It becomes, therefore, a solemn duty, both in justice to the better classes of our fellow-subjects, and to the natives themselves, to apply a remedy for the growing evil."

Captain Hobson then suggests the establishment of factories with a surrounding tract of land, at Cloudy Bay, Hokianga, and in other places, as the occupation of British subjects proceeds. The chief factor to be a magistrate, and a treaty to be concluded with the chiefs for the recognition of the factories, and the protection of the British subjects and their property. Mr. Busby had previously (on the 16th of June, 1837), addressed Sir R. Bourke on the same subject, and recommended that England should undertake the protection of New Zealand, and send troops there; proposing a somewhat similar plan to that adopted with regard to the Ionian Islands.

In the beginning of 1838, a select committee of the House of Lords was appointed to enquire into the state of the islands of New Zealand, and the expediency of regulating the settlement of British subjects therein; a variety of witnesses were examined at considerable length (their evidence extending over 352 pages); the report thereupon was solely that,—

"The extension of the colonial possessions of the crown is a question of public policy, which belongs to the decision of her Majesty's government; but, that it appears to this committee, that support, in whatever way it may be deemed most expedient to afford it, of the exertions which have already beneficially effected the rapid advancement of the religious and social condition of the aborigines of New Zealand, affords the best present hopes of their future progress in civilization."

While her Majesty's government were

* Despatch from Governor Bourke to Lord Glenelg, September, 1837.—Parl. Papers, 7th Feb., 1838.

considering the measures to be adopted for the protection and government of British subjects in New Zealand, the necessity for so doing became more evident, as the European population continued to increase. Almost from the establishment of the mission stations, some respectable families had, from time to time, taken up their abode in various localities. At Kororarika, in the Bay of Islands, they had gradually augmented to several hundred of both sexes, and a regular town had been formed, containing a church and two or three hotels. There were seldom less than eight or ten large ships at anchor in its immediate vicinity; and land fronting the water, suitable for the erection of stores, was valued at £1,000 per acre. With the almost instinctive habits of self, or local government, so characteristic of the British race, an endeavour was made to introduce order in the place of anarchy, by establishing a rude system of justice.

In May, 1838, the inhabitants of the district of Kororarika held a public meeting, to determine "the best means for affording protection to, and regulating other matters connected with, the welfare of the residents, both Europeans and natives." The result was the formation of a society, called the *Kororarika Association*, whose authority was to extend "from Matavai to Brind's bay, in a straight line across the land of Oneroa, or the Long Sandy Beach, and all the land that is bounded by the coast from the beach to the bay." The resolutions adopted were fifteen in number. The first may be taken as a fair specimen of the rest. They all partake strongly (and, under the peculiar circumstances of the case, almost unavoidably) of the spirit of "Lynch law."

"Resolution I.—That in the event of any act of aggression being committed on the persons or property of the members of this society by the natives of New Zealand, or others, the individuals of this association shall consider themselves bound to assemble together (armed, if necessary, on being called upon to do so) at the dwelling of the person attacked; and if any member shall refuse, he shall be fined five pounds sterling. *But if the person attacked be in fault, he shall be fined one pound sterling.*"

The second, third, and fourth resolutions were framed to check desertion from ships, by enacting, that every member should,—

"Consider himself bound to aid any commander of a vessel who may apply for the recovery of runaway sailors, who may be at Kororarika, or in its vicinity, within the prescribed time (i.e. four clear days), and if any member shall refuse to give such aid, he shall pay a fine of five pounds sterling."

The fifth and sixth referred to persons

stealing, or receiving stolen goods, knowing them to be such, and enacted, that the party accused of either offence should be obliged to appear before a committee of at least seven members of the association: in the event of their unanimously pronouncing him guilty, he was—

“To be forwarded to the British Resident, to be dealt with as he shall think fit; but if the Resident refuses to act, then the guilty person shall be punished according to the local laws, which necessity shall compel the association to frame.”

The tenth was enacted to enforce the payment of rents; a committee of at least five members to arbitrate in the event of any disputed point between landlord and tenant.

The thirteenth and fourteenth were as follows:—

“That every member of this association shall provide himself, as soon as possible, with a good musket and bayonet, a brace of pistols, a cutlass, and at least thirty rounds of ball-cartridge: and that the said arms and ammunition shall be inspected, at any time, by an officer appointed for that purpose.

“That to form a fund to defray the expenses of this association, each member shall pay, at the next general meeting, ten shillings, and two shillings per month afterwards.”

The punishment inflicted by this self-constituted tribunal (for Mr. Busby, as had been foreseen, declined any interference) was, the banishment of the offenders from the limits of its jurisdiction, with, in some instances, the addition of tarring and feathering. Resistance was hopeless, as the association could rely on the assistance of the natives. The culprit was stripped, covered with a thick and enduring coating of tar from head to foot, then sprinkled all over with feathers of different sizes; and, in this state, led several times backwards and forwards along the beach, to the tune of the *Rogue's March*, amidst the derisive cheers of the English, and the wild shouts of the aborigines. The wretched delinquent was then placed in a canoe, and ordered to leave the settlement of Kororarika for ever, with an assurance that his reappearance would subject him to a repetition of the same disgraceful punishment.

Six months after the formation of the “provisional government” of Kororarika, steps were taken by her Majesty's ministers for “the establishment of some competent British authority within the islands of New Zealand.”

In December, 1838, Lord Glenelg, secretary of state for the colonies, suggested the

appointment of an officer invested with the character and powers of a British consul, and subsequently advised that certain portions of New Zealand should be added to New South Wales, as a dependency of that colony; and that the officer selected for the above-named purpose should likewise receive an appointment as lieutenant-governor of the dependent settlement thus contemplated. These propositions were assented to by the secretary of state for foreign affairs, and by the lords of the treasury, on the express condition that “the annexation of any part of New Zealand, or any assumption of authority beyond that attaching to a British consulate, should be strictly contingent upon the indispensable preliminary of the territorial cession having been obtained by *amicable negotiation with, and free concurrence of, the native chiefs.*”*

Accordingly, in June, 1839, letters patent were issued, authorizing the Governor of New South Wales “to include within the limits of that colony, any territory which is or may be acquired in sovereignty by her Majesty, her heirs and successors, within that group of islands commonly called New Zealand, lying between 34° 30' and 47° 10' S. lat.” In the following month, Captain Hobson received the appointment of British consul in New Zealand. The instructions† addressed to him by the Marquess of Normanby, who then presided over the colonial department, have an important bearing on questions which have since been, and still are, subjects of grave dispute, but they are too lengthy to be inserted in full; I can therefore only cite the most interesting passages. His lordship states that her Majesty's government had not been unaware of the national advantage likely to be derived from the colonization of New Zealand; but had been restrained from engaging in such an enterprise by deference to the advice and concurrence in the opinions of the House of Commons' committee of 1836; which opinions, he adds, her Majesty's ministers still retained “in unimpaired force,” though compelled to alter their course by circumstances over which they had no control. After adverting to “the fact, that a very considerable body of her Majesty's subjects have already established their residence and effected settlements there, and that many persons in this kingdom have formed themselves into a society, having for its object

* Parliamentary Papers of 8th April, 1840, p. 34.

† Ibid. pp. 37—42.

the acquisition of land, and the removal of emigrants to those islands," Lord Normanby (in a passage previously quoted, at p. 131) refers to the character and numbers of the British population, as necessitating the interposition of the government:—

"I have already stated, that we acknowledge New Zealand as a sovereign and independent state, so far at least as it is possible to make that acknowledgment in favour of a people composed of numerous, dispersed, and petty tribes, who possess few political relations to each other, and are incompetent to act, or even to deliberate, in concert. But the admission of their rights, though inevitably qualified by this consideration, is binding on the faith of the British crown. The Queen, in common with her Majesty's immediate predecessor, disclaims, for herself and for her subjects, every pretension to seize on the islands of New Zealand, or to govern them as a part of the dominion of Great Britain, unless the free and intelligent consent of the natives, expressed according to their established usages, shall be first obtained. Believing, however, that their own welfare would, under the circumstances I have mentioned, be best promoted by the surrender to her Majesty of a right now so precarious, and little more than nominal, and persuaded that the benefits of British protection, and of laws administered by British judges, would far more than compensate for the sacrifice by the natives, of a national independence, which they are no longer able to maintain, her Majesty's government have resolved to authorize you to treat with the aborigines of New Zealand for the recognition of her Majesty's sovereign authority over the whole or any parts of those islands which they may be willing to place under her Majesty's dominion. It is not, however, to the mere recognition of the sovereign authority of the Queen that your endeavours are to be confined, or your negotiations directed. It is further necessary that the chiefs should be induced, if possible, to contract with you, as representing her Majesty, that henceforward no lands shall be ceded, either gratuitously or otherwise, except to the crown of Great Britain."

Captain Hobson was farther directed to announce, immediately on his arrival in New Zealand, "that her Majesty will not acknowledge as valid any title to land which is not either derived from or confirmed by, a grant to be made in her Majesty's name, and on her behalf."

With regard to the conduct to be maintained towards the aborigines, in dealing with them for their lands, Lord Normanby enjoins, not merely the observance of the principles of sincerity, justice, and good faith, but adds:—

"Nor is this all. They must not be permitted to enter into any contracts in which they might be the ignorant and unintentional authors of injuries to themselves. You will not, for example, purchase from them any territory, the retention of which by them would be essential, or highly conducive, to their own comfort, safety, or subsistence. The acquisition of land by the crown for the future settlement of British subjects, must be confined to such

districts as the natives can alienate, without distress or serious inconvenience to themselves. To secure the observance of this, will be one of the first duties of their official protector."

In this document it is expressly stated that Captain Hobson had been selected as especially qualified for the position in which he was about to be placed, from the firm reliance reposed in his uprightness and plain dealing.

"Further explanation having been requested by Captain Hobson concerning some portion of his "Instructions," Lord Normanby, in a letter dated August 15, 1839, thus expresses himself on the chief point in question:—

"The remarks which I have made respecting the independence of the people of New Zealand, relate, as you correctly suppose, to the tribes inhabiting the Northern Island only. Our information respecting the Southern Island is too imperfect to allow me to address to you any definite instructions as to the course to be pursued there. If the country is really, as you suppose, uninhabited, except but by a very small number of persons in a savage state, incapable from their ignorance of entering intelligently into any treaties with the crown, I agree with you that the ceremonial of making such engagements with them would be a mere illusion and pretence which ought to be avoided. The circumstances noticed in my instructions, may perhaps render the occupation of the Southern Island a matter of necessity, or of duty to the natives. The only chance of an effective protection will probably be found in the establishment by treaty, if that be possible, or if not, then in the assertion, on the ground of discovery, of her Majesty's sovereign rights over the island. But in my inevitable ignorance of the real state of the case, I must refer the decision in the first instance to your own discretion, aided by the advice which you will receive from the governor of New South Wales."

In December, 1839, Captain Hobson reached Sydney, where speculations in New Zealand lands, were then openly carried on. An auction for the express purpose being advertised as about to be held some few days after his arrival, Sir George Gipps stopped the sale, by warning all persons intending to become purchasers that they would do so at their own risk. The oaths of office were administered by Sir George Gipps, as governor of New South Wales and its dependencies, to Captain Hobson, as lieutenant-governor "in and over any territory which is or may be acquired in sovereignty by her Majesty, her heirs or successors, within that group of islands in the Pacific Ocean commonly called New Zealand." Having received his commission, Captain Hobson sailed from Sydney, accompanied by a treasurer,* collector of customs,

* In a despatch, dated 20th February, 1840, Captain Hobson complains "of the great inconvenience

police magistrate, two clerks, a sergeant and four troopers of the mounted police of New South Wales; on arriving at the Bay of Islands, on the 29th January, 1840, he immediately issued an invitation to all British subjects to meet him on the following day, at the church of Kororarika, and circulated notices, printed in the Maori (native) language, that on the 5th of February he would hold a meeting of the chiefs of the confederation, and of the high chiefs who had not yet signed the Declaration of Independence, for the purpose of discussing a treaty to be proposed for their consideration. The settlers assembled accordingly; and forty of them, including Mr. Busby and a native chief, signed a document attesting that Captain Hobson had then and there read and published two commissions, namely, the one by which the limits of New South Wales were extended so as to comprehend New Zealand, and the other by which he was appointed lieutenant-governor over such parts of the islands as had been or should hereafter be, ceded in sovereignty to the British crown. The proclamations framed by Sir George Gipps were then read, announcing the assertion of her Majesty's authority in New Zealand, and the illegality of any title to land not confirmed by the crown; but declaring that no intention was entertained of dispossessing "the owners of any land acquired on equitable conditions, and not in extent or otherwise prejudicial to the present or prospective interests of the community."

On the 3rd of February, an address was presented to the Lieutenant-governor, signed by forty-five of the inhabitants of Kororarika, in which they declared that "the establishment of British law and British authority" had long been their first desire, assured him of the satisfaction they felt at his appointment, from their knowledge of his personal character, and pledged themselves to aid him with their "best exertions to establish order, law, and security for life and property in this improving and important colony."

On the 5th of February, having first held a levee at the house of Mr. Busby, which was attended by all the principal European inhabitants, Captain Hobson proceeded and responsibility" he had been subjected to by the want of a colonial secretary, or a legal adviser, stating, that no gentleman suited for offices of such trust could be found in New South Wales, who were not already in better circumstances than the limited means of a new colony could afford them.

about noon to the spacious tents erected for the occasion, supported by Captain Nias and the officers belonging to H.M.S. *Herald*; by Mr. Busby, the members of the Church Missionary Society, the French Roman catholic bishop, and the principal residents, and took his place on a raised platform, the native chiefs seating themselves on the ground in the centre of the area within the tents. The business of the meeting commenced by Captain Hobson's announcing the object of his mission, explaining to the chiefs the effect that might be hoped to result from the contemplated measure, and assuring them, in the most fervent manner, that they might rely implicitly on the good faith of her Majesty's government. He then read the treaty, dwelling on each article, and offering a few remarks explanatory of such passages as they might be supposed not to understand; Mr. H. Williams, of the Church Missionary Society, interpreting in the native tongue, sentence by sentence, all that was said.

The treaty, being not very lengthy, and frequently alluded to in discussions on the present state and future prospects of New Zealand, is given verbatim:—

"Her Majesty Victoria, Queen of the United Kingdom of Great Britain and Ireland, regarding with her royal favour the native chiefs and tribes of New Zealand, and anxious to protect their just rights and property, and to secure to them the enjoyment of peace and good order, has deemed it necessary, (in consequence of the great number of her Majesty's subjects who have already settled in New Zealand, and the rapid extension of emigration both from Europe and Australia, which is still in progress), to constitute and appoint a functionary properly authorized to treat with the aborigines of New Zealand for the recognition of her Majesty's sovereign authority over the whole or any part of these islands. Her Majesty, therefore, being desirous to establish a settled form of civil government, with a view to avert the evil consequences which must result from the absence of the necessary laws and institutions, alike to the native population and to her subjects, has been graciously pleased to empower and to authorize me, William Hobson, a captain in her Majesty's royal navy, Consul and Lieutenant-governor over such parts of New Zealand as may be, or hereafter shall be, ceded to her Majesty, to invite the confederated and independent chiefs of New Zealand to concur in the following articles and conditions:—

"First.—The chiefs of the confederation of the united tribes of New Zealand, and the separate and independent chiefs who have not become members of the confederation, cede to her Majesty the Queen of England, absolutely, and without reservation, all the rights and powers of sovereignty which the said confederation of independent chiefs respectively exercise or possess, or may be supposed to exercise or to possess, over their respective territories, as the sole sovereigns thereof.

"Second.—Her Majesty the Queen of England confirms and guarantees to the chiefs and tribes of New Zealand, and to the respective families and individuals thereof, the full, exclusive, and undisturbed possession of their lands and estates, forests, fisheries, and other properties which they may collectively or individually possess, so long as it is their wish and desire to retain the same in their possession. But the chiefs of the united tribes, and the individual chiefs, yield to her Majesty the exclusive right of pre-emption over such lands as the proprietors thereof may be disposed to alienate, at such prices as may be agreed upon between the respective proprietors and persons appointed by her Majesty to treat with them in that behalf.

"Third.—In consideration thereof, her Majesty the Queen of England extends to the natives of New Zealand her royal protection, and imparts to them all the rights and privileges of British subjects.

(Signed) W. HOBSON."

When Captain Hobson had finished reading the treaty, the chiefs were invited to ask explanations on any point they did not comprehend, and to make any observations or remarks they pleased. Thereupon twenty or thirty addressed the meeting, and opposed the proposition with great violence; and at one period, says Captain Hobson,* "with such effect, and so cleverly, that I feared an unfavourable impression would be produced." "Send the man away," said a chief named Rewa-rewa, addressing his companions; "do not sign the paper; if you do, you will be reduced to the condition of slaves, and be obliged to break stones for the roads. Your land will be taken from you, and your dignity as chiefs will be destroyed."

At this critical juncture Nene and Patuoni arrived with the Hokianga chiefs. Nene, whom Sir George Grey, in a recent dispatch justly designates "our most faithful ally," came forward at the first pause, and "spoke with a degree of natural eloquence which surprised all the Europeans," and turned the tide of feeling among the natives. Addressing himself to his countrymen, he exhorted them to reflect on their own condition; to recollect how much the character of the New Zealanders had been exalted by their intercourse with Europeans; and how impossible it was to govern themselves without frequent wars and bloodshed; concluding by strenuously advising them to receive the British, and to place confidence in their promises. Then, turning to Captain Hobson, he said—"You must be our father! you must not allow us to become slaves! you must preserve our customs, and

* See despatch of Captain Hobson to Sir George Gipps, dated February 5th, 1840, in which a very graphic account is given of the whole transaction.

never permit our land to be wrested from us!" One or two other chiefs followed in the same strain, and the meeting was then adjourned until the day after the morrow, in order to afford them full time for reflection. At this important meeting no presents were given to them, no promises of individual favour made to bribe or bias their decision. Early the next morning it was intimated to Captain Hobson, that the chiefs being perfectly satisfied with his proposal, were desirous at once to sign the treaty, and return to their homes; he therefore assembled the officers of the government, and proceeded to the public tents, accompanied by Mr. Busby and the missionaries, and witnessed about forty-six head chiefs affix their signatures in due form, in the presence of at least five hundred of inferior degree.

"Now therefore, we, the chiefs of the confederation of the united tribes of New Zealand, being assembled in congress at Waitangi, and we, the separate and independent chiefs of New Zealand, claiming authority over the tribes and territories which are specified after our respective names, having been made fully to understand the provisions of the foregoing treaty, accept and enter into the same in the full spirit and meaning thereof.

"In witness whereof, we have attached our signatures or marks at the places and dates respectively specified.

"Done at Waitangi, this 6th day of February, in the year of our Lord, 1840."—(512 signatures.)

The acquiescence of the abovenamed chiefs (twenty-six of whom had signed the Declaration of Independence) was deemed to amount to a full and clear recognition of the sovereign rights of her Majesty over the northern portion of the island, and a salute of twenty-one guns was fired on the occasion.

Captain Hobson forthwith proceeded to the Wesleyan Mission station at Hokianga, where he held a meeting of the chiefs, between four and five hundred of whom assembled, together with a number of natives, in all about three thousand. The proceedings were of precisely the same character as at Waitangi, the Rev. Mr. Hobbs, of the Wesleyan Mission, acting as interpreter: but greater opposition was made to the proposed measure on this than on the previous occasion, which Captain Hobson attributed to the influence of the Roman catholic party, and to some disreputable characters who had located themselves in this vicinity.

The lieutenant-governor nevertheless succeeded in inducing the whole of the head chiefs of the Hokianga to sign the treaty, with two exceptions, and even from

their tribes many inferior chiefs added their names. From the Hokianga, he proceeded to Waitemata, situated in the estuary now called the Frith of the Thames, where, after obtaining the adherence of the principal chiefs in the neighbourhood, he was attacked on the 1st of March, 1840, with paralysis, brought on by anxiety of mind and long exposure to wet. In order that the public service should not suffer by this event, Captain Hobson commissioned Captain Symonds, of the British army, and five members of the Church Missionary society, to procure the signatures of the chiefs of their respective districts to the treaty of Waitangi, these districts comprising the whole of the Northern Island, except Kaitaia, on its north-western extremity, whither he dispatched Mr. Shortland, acting colonial secretary, two gentlemen officially connected with the new government, and the Rev. Mr. Taylor, of the Church Missionary Society.

On the 16th of April, Major Bunbury arrived, with eighty men of the 80th regiment, and Captain Hobson, deeming it advisable to display the dignity and importance of government in a more ostensible manner than could be done by private individuals, dispatched the aforesaid officer in the *Herald* to visit the most important portions of Middle Island or Tavai Poenamou, Stewart's or Southern Island, and such parts of the Northern Island as were not already ceded to the crown, desiring him, if possible, to secure in each place the adhesion of the head chiefs, and especially that of Rauperaha. Before the Lieutenant-governor could receive accounts of more than the partial success of his emissaries, intelligence reached him from authentic sources of the formation into a separate government, of the settlers located at Port Nicholson, under the auspices of the New Zealand Company; their election of a council, and their appointment of Colonel Wakefield as its president. He was likewise informed that taxes had been raised, and most unjust as well as illegal exercise of magisterial authority had been practised.

The measures adopted by Captain Hobson in this emergency may be, for several reasons, best told in his own words:—

"Availing myself of the universal adherence of the native chiefs to the treaty of Waitangi, as testified by their signatures to the original document, in my presence, or to copies signed by me, in the hands of those gentlemen who were commissioned and authorized to treat with them, I yielded to the emergency of the case arising out of the events at Port

Nicholson; and, without waiting for Major Bunbury's report, proclaimed the sovereignty of her Majesty over the Northern Island. Actuated by similar motives, and a perfect knowledge of the uncivilized state of the natives, and supported by the advice of Sir George Gipps, previously given, I also proclaimed the authority of her Majesty over the southern islands on the ground of discovery."

Captain Hobson dispatched Mr. Shortland to publish the proclamation above referred to, together with another addressed to the settlers at Port Nicholson, desiring him immediately on his arrival—

"To displace all persons holding office under the authority of the usurped government, except such as may be engaged by them, merely for private purposes; and to restore to all persons the possession of property, of which they were in occupation when the emigrants arrived, and from which they had been forcibly ejected, by persons calling themselves magistrates."

Meanwhile, Major Bunbury and the other gentlemen appointed by Captain Hobson to carry out the remainder of his instructions (which bodily weakness prevented him from fulfilling in person), after obtaining the signatures of the chiefs of the Northern Island, proceeded to the Middle Island, where they procured the assent of a sufficient number of the head chiefs to warrant the assumption of the sovereignty by cession, and took possession of Stewart's or Southern Island by right of discovery.

Major Bunbury gives the following account of his own tour:—

"I visited the harbours of Coromandel, Mercury Bay, Touranga, Hawke's Bay, Port Nicholson, Robuka Island (Foveaux straits), the islands of Capiti and Mana, Otago and Southern Port (Stewart's Island). From all these places I obtained the necessary signatures, excepting in two places, where my mission had been anticipated by other gentlemen sent by Captain Hobson. At Southern Port (Stewart's Island), and at Cloudy Bay (Middle Island), Captain Nias and myself, judging it would be for the best interests of the natives, as well as European settlers, that further delay should not take place, we proclaimed the Queen's authority with the usual ceremonies, at the former place, on the 5th of June, where we did not meet with natives, by right of discovery; and at the latter on the 17th of June, from the sovereignty having been ceded by the principal native chiefs."

It may here be asked how far the natives really understood the meaning of the treaty of Waitangi, and what their idea was of the right of sovereignty thus conceded, since in the native language there was no such word. The definition given by Nopera, one of the Kaitaia chiefs, when arguing with his countrymen on the subject, offers, perhaps, the most correct answer to both these questions. "The shadow of the

land," he said, "goes to Queen Victoria; but the substance remains with us. We will go to the governor and get a payment for our land, as before." The principal chiefs of the Middle Island were like those of the Northern, most pertinacious in their inquiries as to whether the document which they were requested to confirm, would give any right to the Crown to deprive them of their lands; some were even averse to receiving presents after signing it, lest they should give encouragement to any such pretension. For my own part, I feel no doubt, that the belief of the native chiefs was, that in signing the treaty, they sanctioned the assumption on the part of England, of *magisterial jurisdiction only*, and had no idea of its involving the surrender of any *territorial rights* whatsoever.

To return to the proceedings of what we may now term the local government, which was at first fixed at a place called Russell, three miles from Kororarika, in the Bay of Islands; but about November, 1840, removed to a new site, termed Auckland, situated on an isthmus of land about four miles broad, which unites the northern and southern portions of the Upper Island, and forms, as it were, the connecting link between the opposite coasts, having on the east side the Bay of Waitemata, one of the best harbours in New Zealand; and on the west, the Bay of Manukao, which has likewise a good harbour. Whether considered in reference to these singular advantages, or to its extensive inland water communication,—to the considerable proportion of arable land and fine timber in the adjoining districts, or viewed with regard to its being in the vicinity of the European population who had so long needed the control of some legally organized authority, and likewise of the largest number and most christianized portion of the natives; the selection of this position for the capital was unquestionably a judicious one, and was considered as such by her Majesty's government, who confirmed the choice of Captain Hobson.

A charter for "erecting the colony of New Zealand, and for creating and establishing a Legislative and an Executive Council, and for granting certain powers and authority to the governor for the time being of the said colony," was signed by the Queen on the 16th of November, 1840. This charter or letters patent defined the colony of New Zealand to consist of the

group of islands lying between $34^{\circ} 30'$ and $47^{\circ} 10'$ S. lat., and $166^{\circ} 5'$ and 179° E. long.* and declared that the three principal islands heretofore known as the Northern, Middle, and Stewart's, should henceforth be designated and known respectively as *New Ulster*, *New Munster*, and *New Leinster*. The Legislative Council was to consist of not less than six persons, nominated by the crown, and holding office during its pleasure, with power to make laws and ordinances for the colony, conformable to instructions from the Queen in Council; the Executive Council to be composed of three of the principal members of the government, to assist and advise the governor, who was to be nominated by the crown.

In this charter we find a clause empowering the governor to grant "waste lands," either to private persons or to corporate bodies; but the following paragraph states:—

"Provided always, that nothing in these our letters patent contained, shall affect or be construed to affect the rights of any aboriginal natives of the said colony of New Zealand, to the actual occupation or enjoyment in their own persons, or in the persons of their descendants, of any lands in the said colony now actually occupied or enjoyed by such natives."

Captain Hobson was appointed governor and commander-in-chief of the new colony, and instructions were issued under the royal sign manual, dated the 5th of December, 1840, prescribing his powers and duties, and those of the Legislative and Executive Councils; a survey was to be made, and the colony, as soon as practicable, divided into *counties*, and as nearly as may be into *hundreds* of 100 miles square, and *parishes* of twenty-five miles square. The "waste and uncleared lands belonging to and vested in the crown," were hereafter to be sold at one uniform price. Finally, the governor was enjoined to use every effort "to promote religion and education among the native inhabitants;" "to protect them in their persons, and in the free enjoyment of their possessions; by all lawful means to prevent and restrain all violence and injustice, which may in any manner be practised or attempted against them, and to take such measures as may appear necessary for their conversion to the Christian faith, and for their advancement in civilization."

In the instructions from Lord John

* These boundaries were subsequently altered as will be shown in Topography chapter.

Russell to Governor Hobson, dated 9th of December, 1840, his lordship, referring to the aborigines, said:—

"They are not mere wanderers over an extended surface in search of a precarious existence, nor tribes of hunters or of herdsmen; but a people among whom the arts of government have made some progress—who have established by their own customs a division and appropriation of the soil—who are not without some measure of agricultural skill, and a certain subordination of ranks, with usages having the character and authority of law. In addition to this, they have been formerly recognised by Great Britain as an independent state; and, even in assuming the dominion of the country, this principle was acknowledged, for it is on the deliberate act and cession of the chiefs, on behalf of the people at large, that our title rests."

A civil list was drawn up, fixing the salary of the governor, at £1,200; that of the chief justice, £1,000; colonial secretary, £600;* treasurer, £600; surveyor-general, £600; collector of customs, £500; attorney-general, £400; protector of aborigines, £400. Total, 5,300. The expenses of the above establishment were estimated at £6,000; public buildings and works, £5,000; contingencies at £3,000. Total, £19,300. To meet these charges, it was expected that £10,000 would be raised from duties levied in New Zealand, from 4,000 Europeans; £5,000 to be raised within the colony from land sales there, and £5,000 to be voted by Parliament. The two chief sources of revenue expected were duties on imports, viz., spirits, tobacco, tea, coffee, and sugar, and assessments on uncultivated lands in the hands of private individuals.

I have now traced the leading events in the history of New Zealand, for a period of nearly two centuries, namely, from its discovery by Tasman in 1642 to its formation into a British colony in 1840. Before proceeding further it may be necessary to state that very different opinions are entertained concerning the measures which led to, and terminated in the treaty of Waitangi; some parties considering them to have been injudicious and uncalled for, because New Zealand, before the conclusion of that treaty, was already a British dependency. This view of the case is supported on the following grounds, viz., that Captain Cook,

* The salary of the colonial secretary, of the colonial treasurer, and of the surveyor-general, was to be increased £10 per annum till it reached £800; that of the attorney-general was to be increased £10 per annum, till it reached £500.

† In 1787, the King of England, in a royal commission, declared New South Wales, on the east

the first European who set foot on its shores (which it will be remembered Tasman never did), took possession of both islands in 1769, with the customary formalities; that, consequently, when the colony of New South Wales was formed, New Zealand was included within the jurisdiction of Captain Phillip, its earliest governor;† that in 1814 and in 1819, Governor Macquarie claimed and exercised authority there by appointing magistrates; that in 1832, a British Resident was stationed at the Bay of Islands; and that, in December, 1837, a man named Edward Doyle underwent the extreme sentence of the law at Sydney, New South Wales, for a burglary committed at the Bay of Islands, on the 18th of June, 1836; the sentence being executed under the authority of an act of the Imperial Parliament. (9 George IV.) The remark by the British government of the vessels belonging to New Zealand, and of a distinctive flag, is asserted to be no more than had been previously done in the case of British possessions, and with regard to the Declaration of Independence in 1835, the remark of Sir George Gipps, is cited, that it was simply "a paper pellet, fired off by Mr. Busby at the Baron de Thierry."

On the other hand, it is contested that the rights of the Crown in New Zealand (at least as far as the two principal islands are concerned), rest solely on the treaty of Waitangi.

The chief arguments used to enforce this opinion will be found succinctly stated in a memorandum transmitted by Lord John Russell to Viscount Palmerston, bearing date 18th of March, 1840. It is there stated "that the British statute book has in three distinct enactments, declared that New Zealand is not a part of the British dominions; and secondly, that King William IV. made the most public, solemn, and authentic declaration which it was possible to make, that New Zealand was a substantive and independent state," by accrediting Mr. Busby to the chiefs, in a letter addressed to them as heads of an independent people, and still more by formally and practically acknowledging their national coast of Australia, "extending from Cape York, lat. 11° 37', to the South Cape, lat. 43° 30', and inland to the westward as far as 135° long., comprehending all the islands adjacent in the Pacific Ocean within the latitude of the above-named capes," as part of the British dominions, in virtue of the sovereignty established by Captain Cook.

flag, and giving effect to the registers of their vessels. With regard to the right acquired by the proceedings of Captain Cook, it has been urged, not only that it was, at the utmost, "a right inchoative, good as against third parties, but not as against the native owners of the soil," but that even if England had thereby become possessed of any kind or degree of dominion over these islands, such assumption had been wholly annulled and abrogated by the subsequent unqualified admissions of the national independence of New Zealand. Having briefly enumerated the points most strongly insisted upon, on either side of the question, most of which have been more fully dwelt on in the previous pages, I leave the reader to form his own conclusion.

NEW ZEALAND COMPANY.—Before entering upon the administration of Governor Hobson, it is necessary to give some account of a company, whose proceedings during the last ten years have materially affected the interests of that colony, and have exercised an important influence over the minds of what may be termed the "colonizing" portion of the British population.

I approach the subject with reluctance, for it involves the investigation and analysis of perplexing and contradictory statements, and necessitates inquiry into the transactions of a corporate body, which, during its whole existence, has been more or less at variance, both with the imperial and local government.

In order to give some idea of the manner in which the "New Zealand question," as it is called, has been overwhelmed with voluminous masses of documents, I may enumerate a portion of the materials which I deemed it necessary to examine, before attempting an exposition of the leading facts connected with it. Irrespective of the numerous debates in both Houses of Parliament, *one** of which contains 287 closely printed 8vo pages, there are the parliamentary reports and papers, printed by order of the Houses of Lords and Commons, or presented by royal command, occupying 4,548 large folio pages. The twenty-five reports of the "Directors of the New Zealand Company," and the documents appended thereto, extend over 2,882 octavo pages; the eight ponderous

volumes of the *New Zealand Journal* (the weekly organ of the directors of the company), contain 2,768 pages. But this is far from being the whole that has been printed and published on this subject. There are now before me four-and-twenty different works on New Zealand, several of them in two volumes, some attacking, others vindicating the conduct of the Company; besides, the journals of the Bishop of New Zealand, the reports of the Church and Wesleyan Missions, and of the Aborigines Protection Society, not to mention innumerable pamphlets, and papers put forth at various times in magazines and periodicals. Altogether, I consider the mass of printed matter exclusively relating to New Zealand, which has come under my notice within the last few months, would about equal twenty thousand printed 8vo pages; a very large proportion of this has a direct bearing on the affairs of the Company.

Notwithstanding these voluminous statements, there does not anywhere appear, a clear, impartial, and connected view of the proceedings of the individuals, who, at different times, endeavoured to form associations, the common object of which, under different pretences, was the acquisition of lands in New Zealand at a very low rate, and their resale in England at a very high one.

The first attempt of the kind which I have been able to trace, was made by an unchartered association, formed in 1825, for whom, in 1826-7, a Captain Herd purchased some land at Herd's Point,* in the Hokianga river, and two islands at the entrance of the Waitemata river. The tract at Herd's Point, or Okara, remaining unoccupied, the natives requested Mr. W. White, a Wesleyan missionary, when proceeding to England in 1836, to find out the parties by whom it was claimed, and request them either to come and take possession of it, or receive back the value of the consideration that had been given for it; adding, that in the event of neither proposal being complied with, they intended to resume the land.

In another place, when endeavouring to trace some portion of the large amount of capital which has been at different times and by various means acquired and dissi-

* Debate in the House of Commons on 17th, 18th, and 19th June, in the case of New Zealand and the New Zealand Company; printed by John Murray, 1845.

* This tract was constantly represented by the Association as of considerable extent; it eventually proved to comprise about *one square mile*.—See App. to Rep. from Parl. Com. on New Zealand in 1844, p. 636.

pated by the New Zealand Company, I shall have occasion to notice the sums of money said to have been expended in extinguishing associated or individual pretensions. For the present it is sufficient to state that Mr. Dillon Bell, acting secretary to the New Zealand Company, writing to Lord John Russell, in April, 1841, states expressly that (excepting the territory on both sides of Cook's Straits, which Colonel Wakefield is alleged to have purchased in 1839,) the extent of their possessions amount only to a "tract on the Hokianga river, claimed in virtue of a contract with Lieutenant M'Donnell, and two islands at the mouth of the Thames, claimed in virtue of a contract with the New Zealand Company of 1825. These islands and the tract at Hokianga are wholly unfit for the seat of a considerable colony."

On the 22nd of May, 1837, the first meeting of an "Association for the colonization of New Zealand," was held in the Adelphi, London, Mr. Edward Gibbon Wakefield in the chair,* and the views entertained by its projectors were soon after made public, in a full-sized duodecimo volume.† The main object of the Association was to obtain from the Crown the power of acquiring, in its own right, and for its own purposes, the cession of the sovereignty from the aborigines, and of purchasing their lands and re-selling them in England at "a sufficient price," by lottery, as had been previously done (with considerable pecuniary advantage to the projectors and early speculators) in South Australia. (See Div. iv. p. 639.) Having obtained this delegated authority, the step next contemplated was to borrow capital, with which to make the first purchases of land, then to buy another tract with part of the proceeds of the first resale, and to continue repeating the "operation over and over again," until—but here it may be best to let the propounders of the project themselves describe the con-

templated result of such a course of proceeding—

"But this operation would probably be repeated over and over again, in the formation of new settlements and the extension of old ones. Suppose that, in progress of time, British New Zealand, or Victoria as it may be called, should be saddled, to use a common expression, with a debt of several millions—what then? Why, a time would surely come, and long before all the land of these islands had become private property, when it would be not only inexpedient, but mischievous to add to the colonial population by means of emigration from Britain; and, from that time forth, the whole of the sums received as the purchase-money of public lands, (deducting payment to natives, and a small portion for local improvements,) would be an available fund for paying off the colonial debt."—*Principles, Objects, and Plans of the New Zealand Association*, p. 61.

In the ensuing page of the work are some forcible remarks respecting "the great evil belonging to our present mode of colonizing New Zealand," viz., "the frauds practised by British settlers in their bargains with the natives for land," which were the cause of "disputes arising out of such real or pretended bargains." After referring to "adventurers laying claim to large tracts without a shadow of right," the association recommended that "from the time when a British authority was established in New Zealand, or seriously contemplated, it would be most expedient to put an end to all private bargains for land."‡

It will be readily conjectured, that the objects of the Association (avowed and latent) excited the serious alarm both of the Church and Wesleyan Missionary Societies. Mr. Dandeson Coates, in an able pamphlet, before referred to, exposed several of the fallacies contained in the volume from which I have just quoted, but especially denounced the pretence of disinterestedness under which the desire of "gain, the main-spring and ultimate end of the whole scheme," was hidden. Mr. Coates remarks, that "it is generally and confidently reported, that in the event of the government sanctioning the project of the

* *New Zealand Journal*, No. 130, for 1844, p. 658.

† *The British Colonization of New Zealand, being an Account of the Principles, Objects, and Places of the New Zealand Association*, (422 pages), published for the Association, by J. W. Parker. Preface dated 20th October, 1837.

‡ The leading members of the association must have been well aware that these measures had long been urged upon her Majesty's ministers by the governor of New South Wales. Mr. Busby, in a despatch, dated 16th of June, 1837, recommended that simultaneously with the establishment of a British government in New Zealand, means should be resorted to for ascertaining and fixing, upon equitable

principles, the titles of British subjects to land, which they claimed to have purchased from the natives; that a special commission of persons not connected with the country, should be appointed for this important duty, adding, that after the existing claims were disposed of, it would be necessary to declare all purchases void, of which sufficient notice had not been given to the government, in order that the real proprietors of the land might be ascertained. "Humanity," says Mr. Busby, "would also require that certain districts should be fixed in perpetuity in the native proprietors, and that it should be enacted that all claims to the possession of such lands by foreigners, howsoever acquired, should be absolutely null and void."

association, the chief administrative authority would be confided to Mr. E. G. Wakefield. If so," he adds, "why is it not told? Why are the public kept in ignorance of a point so deeply affecting the success of the undertaking?"*

Mr. Wakefield, in a published letter, dated 12th December, 1837, purporting to be written in vindication of the proposed Association, does not contradict the latter assertion, but carries the war into the enemy's camp, by attacking the Church Missionary Society in general, and Mr. Coates in particular; admitting, nevertheless, that "the missionaries have so far humanized the natives, as to render the country very attractive to such British settlers as have no object but gain;" he declares that "a portion of the plan of the Association, which Mr. Coates has disdained to mention, forms one of the greatest missionary projects ever suggested;" and concludes with a panegyric on "the deliberate, systematic, and much-approved plan of the New Zealand Association."

If, however, Mr. Wakefield felt aggrieved by the silence of the lay secretary of the Church Missionary Society, concerning a portion of the scheme which he so highly lauds, full amends were made for that omission, by the secretary of the Wesleyan Society, the Rev. John Beecham, who, in a pamphlet entitled *Colonization*, examines separately each proposition of, perhaps, one of the wildest and most impracticable theories ever promulgated by a public body, as exhibiting something like a sketch or outline of their actual plan of proceeding.

I subjoin Mr. Beecham's extracts from, and comments on, the chapter entitled, "Exceptional Laws in favour of the Natives of New Zealand," in which the means to be used for civilizing the natives are stated at considerable length. Let it not, however, be supposed, that the following able exposition of the absurdity and utter fallacy of the propositions contained therein, occasioned its abandonment: on the contrary, it remained a much-vaunted part of the scheme of the New Zealand Association of 1837, and became so of the New Zealand Company of 1839, though no attempt was ever made to carry it into execution:—

"The chapter," says Mr. Beecham, "commences

* I would here be understood only as quoting the sentiments of Mr. Coates; for I believe that many of the members of the Association were really actuated by sincere, but ill-directed philanthropy.

upon the principle, that the New Zealander is not capable of being converted at once into a British subject, and that he cannot, therefore, be placed immediately under British law. 'Since then,' it is remarked, 'the people are not adapted to our laws, the only course which remains for us is to adapt our laws to the people.'

"2. The recently-discovered method of transplanting a full-grown tree without injury from one soil to another, is used as a simile to represent the introduction of the New Zealanders, with their national peculiarities and usages, into the British colony; removing only those customs which are radically bad, and sedulously fostering whatever may be innocent and characteristic.

"3. *Chieftainship*, being one of the most obvious and striking peculiarities of the social system in New Zealand, it is said, is to be respected; and it is proposed that—

"'Every chief who disposes of his lands to the British crown, and consents to liberate his slaves, should have allotted to him, within the British settlement, such a tract of land, proportionate in the case of each several chief to the extent of territory which he has ceded, and the number of slaves to whom he has granted their liberty, as would place him in as favourable a position with regard to the possession of landed property, as the principal English settlers. This land should be kept in reserve for him, until by education and intercourse with civilized people he had learned to estimate its value.'

"Where the chief is to live, and what are to be the means of his support, until, by the proposed educational process, he shall be prepared to take possession of, and enjoy, his reserved estate, is not, however, to be learned from the book. This proposal appears so very liberal, that it is judged necessary to stop and defend it.

"'Nor should we,' [it is argued, 'be acting unjustly by ourselves in conferring so great a benefit upon the New Zealander. The benefit which he would confer upon us by ceding to us his territory would be immeasurably great, and beyond all comparison greater than the consideration which he would be likely to demand, or we should be willing to give for it. In order therefore, to be just in the sight of our own consciences, we must grant him some further benefit; and what benefit can we grant him more suitable for his circumstances, with more ease to ourselves, and more in accordance with our own principle of colonization, than a portion of that land' (that is, a portion of his own land) 'which has so greatly increased in value by the mere circumstance of our possessing it.'

"This will, no doubt, be regarded by the reflecting reader as one of the most remarkable instances of casuistry,—one of the most ingenious remedies for an unsettled and uneasy conscience, that has ever come under his observation.

"4. The services of the more respectable colonists are to be called into requisition in teaching the New Zealanders:—

"'It would therefore be incumbent upon the members of the best families among the English to lay themselves out, as one of the finest occupations in which they could engage, for the cultivation and improvement of the native mind, for training them up to civilized habits, courteous behaviour, decorous conduct, and generous sentiments.'

"5. 'Some of the picturesque and romantic insti-

tutions of the feudal age' are to be revived. 'The establishment of a principle of social alliances throughout the colony' is proposed; and it is intended that the principal English families shall adopt, as their friends and allies, the chief families of the territory where they may have established themselves. The advantages of this arrangement are thus argued:—

"Nor would such an institution be without its value for the English gentleman as well as the New Zealand chief. It would confer upon both an honourable distinction of a neutral character, and founded, as all honourable distinctions ought to be, in the high qualities of confidence, generosity, faithfulness, respect for social ties, and regard for the interests of posterity. The offices of the English leader towards his adopted friend would be,—to entertain him as his guest, to instruct him in the point of honour, to correct his savage notions with regard to the retaliation of injuries, to influence his pursuits, to teach him the value of property, and the obligations it entails on its possessor. The younger members of the families of the chiefs might be introduced into the families of their English protectors, to undergo that wholesome mixture of education, service, manly exercise, and moral discipline, which the sons of our English gentry were once accustomed to receive in the houses of the wealthier nobility. Their daughters would be the especial care of the English ladies, and would receive from them such instructions, and render them such services, as would best fit them for their place in society."

"6. Next, *Heraldry* is to render its aid. The chapter proceeds:—

"It can scarcely be doubted, that these alliances would be more palpably and more gracefully cemented, were the English family to confer on the New Zealand family a *coat of arms*, somewhat similar to their own, but with such a modification as the rules of heraldry might prescribe, in order to keep up the difference between them. Heraldry, too, with its achievements and honorary distinctions, might be turned to good account in rewarding merit in the New Zealander; it would be a practice well-suited to impress his imagination, and might be made available for purposes which have grown obsolete in England."

"7. Then *chivalry* is to contribute its part; and St. Palaye's ancient chivalry is to be a text-book —

"The institution of chivalry is acknowledged to have had a wonderful effect, in softening the manners and improving the character of our ancestors in the middle ages; and there are so many points of resemblance between the state of society at that period, and the actual condition of the New Zealanders, that we should not lightly reject the assistance we might derive from St. Palaye, in framing their social institutions."

"8. In connexion with chivalry, 'the *kind of literature* which would be likely at once to suit their taste, and to elevate and improve their characters,' comes under consideration; and the question is decided in favour of 'the *old romances of chivalry and the heroic poets*.'"

"Few things," it is said, "would be more interesting than to observe the effect which might be produced upon such natures, by reading to them, in their own language, *some stirring passage of Homer, or some affecting incident from the pages of Sir Thomas Malore*."

"9. After this, the question of *criminal law* is

considered, on the principle that 'it would be palpably unjust to govern savages by the strict enforcement of a criminal law, framed for civilized communities.'

"The plan having thus been sketched out, a few paragraphs are added respecting the spirit in which this benevolent enterprise is to be prosecuted."

"Such," it is concluded, 'are some of the provisions which might be made for preserving and improving the native race, and making it contribute to the future greatness of the whole community; but let us not forget the high and holy principle which must be the soul of every effort for the benefit of mankind.'

"Before, however, the consideration of 'the *soul*' of the system devised for elevating the New Zealanders is entered upon, the reader is requested to pause for a moment longer upon the *system itself*. Can any one seriously believe that this scheme describes a middle state, through which it will be practicable to raise the New Zealander from 'primitive barbarism' to 'high civilization?' If the subject were not of too grave a character—if it did not really and truly involve the destinies of a noble though barbarous aboriginal race, it might well provoke a smile to imagine the effect which the description of this plan would have upon the mind of the New Zealander himself, did he sufficiently understand it. Could he at all be made to comprehend this heterogeneous compound of his own national peculiarities and customs, ancient feudal institutions, and the regulations of modern civilized society—could anything approaching to an adequate idea of chivalry and St. Palaye, heraldry and a coat of arms, the old romances and heroic poets—Homer and Sir Thomas Malore—be introduced into his mind; at the same time that he was given to understand that it was intended by these means to transform him into a gentleman, and enable him to take his place among the intelligent and polished subjects of the Virgin Queen, who was to honour his country by giving to it her own name—what would be his wonder and incredulity on being permitted to peep through such a vista to his destined future elevation and greatness!"

After adverting to the absence, on the part of the association, of any pledge for the support of even a single Christian teacher for the natives, Mr. Beecham remarks:—

"The fact is, that the principle on which the colony is to be founded will so operate, as to put it out of the power of the association to make an adequate provision for the religious instruction of the natives. They have a lure for every description of character whom they wish to conciliate and engage in their cause; and the recommendation of their plan, which they offer to the political economist, is, that it is a *self-supporting* colony which they propose to form. Be it so; but this clashes with the recommendation of it which they give to the Christian philanthropist. They cannot, then, have the means which will enable them to perform their promise to the latter. According to the financial part of their plan, which is pretty clearly developed, it appears that the profits arising from the re-sale of lands to the settlers are to form an emigration fund; and that the expense of commencing the colony, and providing for the erection of public buildings, the administration of government, defence of the colony, and such like matters, is to be met by borrowing

money on interest, until a colonial revenue shall be created. Seeing that this vast and expensive undertaking is thus to be commenced with borrowed money, is it at all likely that the association would venture to increase that great risk which they must necessarily run, by taking up, at a high rate of interest, those additional sums which would be required to meet the expense of providing a sufficient number of Christian teachers for the benefit of the natives? Believe it who may.

"What, then, is the conclusion to which the inquirer is at length conducted? Why, after all the high-wrought panegyrics which have been bestowed upon the new and vastly improved system of colonization which the New Zealand Association have devised; after all the glowing descriptions of its transcendent excellence, as a system for communicating Christianity and civilization to the natives; it turns out that the philanthropic part of their plan, which is thus put forward so prominently, for the purpose of influencing religious and benevolent persons to embark in the undertaking, is not to be carried into effect *by the Association themselves*. The agency necessary for effecting the elevation of the natives is left contingent on *the zeal to be awakened in the mother-country*; and the pecuniary means necessary for its support are looked for from *zealous societies or individuals*, and are not to be provided out of *the funds of the Association*. If the language which the Association employ have any meaning, then is it most manifest, that the work of Christianizing the New Zealanders, on which, as has been shown, their civilization entirely depends, is to be left in the hands where it now is; and that the Missionary Societies, and their liberal friends and supporters in this country, are to enjoy, as at present, the privilege of providing *pecuniary means*, as well as agents, for its successful prosecution."

The sound, practical sense of the above observations is not more conspicuous than the genuine and single-minded zeal for the best interests of the natives which distinguishes the whole of Mr. Beecham's pamphlet. If his arguments, together with those of Mr. Coates, had had their due weight with the public generally, much of the misery attendant upon the formation of the settlements of Wellington, Plymouth, and especially of Nelson, might have been avoided.

But this is anticipating. To return to the course of events. The promoters of the proposed Association, aware (according to Mr. Wakefield)* that "the Colonial-office would be hostile" to their project, sought and obtained, through Mr. Francis Baring, M.P., an interview with the premier, Viscount Melbourne, in June, 1837; Lord Howick, then a member of the government, "who had paid great attention to colonial subjects," was likewise present.

At this interview, it is important to re-

mark, that "no draft of a bill was produced, and no detailed account was given of the means which the association proposed to adopt for carrying their objects into effect; but almost immediately after it, a very imperfect outline of a proposed bill was submitted to Viscount Melbourne, and also to Viscount Howick, by Mr. Baring, on the 14th of June, 1837, "under an impression," says Mr. Wakefield, "that Lord Melbourne, not intending to bestow much attention on the subject, would probably be guided by the judgment of Lord Howick."

The latter-named nobleman, on being informed that such an impression existed, immediately wrote to Mr. Ward, the secretary of the Association, stating that there was a misapprehension as to the extent of the authority given to him on the subject; and, in a letter to Mr. F. Baring, dated the 29th of June, "disclaimed having any power to give any decision, on the part of the government, upon the proposal." His lordship "always expressed his opinion that the scheme was not at that time so far matured as to render it possible for the government to express a definitive opinion, either favourable or hostile to the measure; and that it was only when the clauses of it (the bill) were actually drawn out, and when the manner in which the principle was carried into effect should be seen, that the government could possibly form a judgment whether the bill would be objectionable or not."*

On the 29th of December, a deputation from the New Zealand Association again waited on Lord Melbourne, Lord Glenelg being present as colonial minister. A week after, the same persons had an interview with Lord Glenelg, at the Colonial-office, and were then informed that, during the week, some important despatches had been received from New Zealand (alluding to those of Captain Hobson and Mr. Busby: see p. 137); and that her Majesty's ministers were disposed to entertain the proposition of sanctioning the formation of a colony by a public association. They objected to its establishment by act of Parliament; but were willing to consent to "the incorporation, by a royal charter, of various persons, to whom the settlement and government of the projected colony, for some short terms of years, would be confided."

* Evidence of Mr. Edward Gibbon Wakefield, before the Commissioners' Committee, 13th July, 1840.

* Mr. E. G. Wakefield's evidence before Parliamentary Committee, 1843—questions 883, 888, 891, 892.

This offer was officially made by Lord Glenelg to Lord Durham, in a letter dated the 29th December, 1837; the chief provisions or conditions of the proposed charter being to the following effect:—

The settlement to be established, "if at all," with the free consent of the existing inhabitants or of their chiefs. Crown to nominate officers, with whose concurrence alone contracts for the purchase of land from the natives should be made; and no contract to be valid without its assent. Government to have a veto as to the persons who should compose the governing body of the corporation in the first instance, and the power of nominating a certain number, if they should think it expedient; and also to possess *a veto on the nomination by the corporate body of the governor* and other important functionaries. The crown to have the right of disallowing all laws enacted for the government of the colony. The whole administration—legislative, judicial, military, and financial—to be confided to the corporate body during the continuance of the charter; but the utmost publicity to be given to the proceedings of the association, by periodical reports to government and Parliament, quarterly courts, &c. A fixed proportion of the proceeds of the sales of land to be appropriated to the erection and maintenance of places of divine worship and school-houses, and for the support of ministers of religion. The most ample participation in the benefits of this provision for religious and scholastic instruction to be secured to the aborigines, for whom protectors were to be appointed by the Queen, and paid out of the land fund. Gratuitous grants of land to be prohibited, and all lands to be sold by public auction, at a fixed upset price. The rights already lawfully acquired in New Zealand by British subjects to be protected; and the missionaries to be secured in the freest exercise of their functions, in imparting religious instruction to the natives. Finally, before the colony entered upon the transaction of business, a certain capital was to be subscribed, and some definite portion paid up.

By another clause it was required that the proposed colony should not be co-extensive with the whole of the islands of New Zealand, and it was stated that a similar charter of incorporation might be granted to any other body, such companies not to interfere with the jurisdiction of each other, and to have the same restrictions im-

posed as to the selling price of land, and as to any other important particular. Concurrence with these conditions (which were evidently framed to prevent land-jobbing, and thwart plans of individual aggrandizement) was at once refused, and the offer of a charter consequently withdrawn. The Association, nevertheless, determined to prosecute their object; and if possible to force the government to a compliance with their views, through the medium of Parliament. Their first move was made in the House of Lords, where, mainly by their influence, a committee was appointed, whose "Report," dated 3rd April, 1838, has been already quoted (p. 137). So far, however, from advocating the views of the Association, the Lords declared the extension of the colonial possessions of the crown to be a question of public policy which belonged to the decision of her Majesty's government, and recommended solely that support should be given to the exertions which had already produced such beneficial results; alluding of course to the fruits of missionary labour, of which abundant evidence had been adduced before the committee.

Thus foiled in the Upper House, the association reverted to their original intention of proceeding by bill in the House of Commons. Accordingly in June, 1838, Mr. Francis Baring and Sir George Sinclair, brought in a bill, the preamble to which, after setting forth the advantages offered by New Zealand for colonization; the augmenting numbers of British settlers; the regular and increasing trade and intercourse carried on with British and other shipping; and the necessity for the establishment of some authority; goes on to the effect that—

"Whereas divers of her Majesty's subjects now in Great Britain, and possessing among them considerable property, are desirous of settling in such parts of the islands of New Zealand as the native inhabitants may be willing to cede to her Majesty, provided that adequate protection be secured to their persons and properties within such territories; and that others of her Majesty's subjects are ready and willing to advance considerable sums in order to the foundation and maintenance of settlements in the said islands, upon condition that the government thereof be confided provisionally to commissioners specially appointed for that purpose, with the approval of the crown; that the waste lands be disposed of to settlers by sale only, upon a sound and uniform system, and that the purchase-money thereof be employed principally as an emigration fund."

The leading enactments of the bill by which, according to the preamble, her Majesty's said subjects were to be enabled to carry the above purposes into effect, were

the appointment of sixteen commissioners therein named, *three* or more of whom might sit as a board, and in the absence of the chairman, might appoint one of their number "to preside for that turn," and exercise the chairman's privilege of a casting vote. The commissioners to be empowered to make treaties with the natives or other competent persons in New Zealand, to impose taxes, customs, duties, and assessments; appoint councils of government; constitute courts of justice; exercise civil and criminal jurisdiction; maintain and command armed land and sea forces; proclaim and enforce martial law whenever they should deem necessary; borrow money to any extent at 10 per cent.; create "a public debt to be owing by the settlements in all time to come to the holders of all such securities, bonds, obligations, or grants of annuities as shall have been made, granted, or issued by the said commissioners," and all without any private responsibility on the part of the borrowers. There were other clauses authorizing the Queen on the application of the commissioners, to erect a bishopric in New Zealand, decreeing that it should be lawful for her Majesty to appoint a protector of aborigines. All purchases made by individuals after the proclamation of this act in New Zealand, to be void.

The land purchased from, or ceded by the natives was to be sold at an uniform price of not less than 12s. an acre, "whatever the quality or situation of the land put up for sale," (rock, mountain, or bog). The land revenue thus obtained, after deducting one-fourth, to be divided into two parts—one called the "purchase fund," and the other the "emigration fund,"—the former to be used for the "fulfilment of such treaties or contracts for the cession of territories and sovereign rights, as shall be

* Mr. E. G. Wakefield assured the Parliamentary committee of 1840, that "the New Zealand Association resembled in its constitution the Anti-Slavery Society;" that "*no member of it had any private interest whatever*;" in fact, that all were actuated by purely patriotic motives. This assertion is, as we have already seen, contradicted by the clause (43) which provided for the reimbursement to some of the commissioners named in the bill, of moneys said to have been expended by them, and others under the name of the New Zealand Company of 1825, but on other grounds their alleged "*patriotic motives*" are pointedly denied by several individuals; among other statements I find the printed copy of a letter transmitted officially to Lord Glenelg on the 4th of January, 1838, of which the original was forwarded to Mr. E. Gibbon Wakefield

made in pursuance of this act; and in defraying the incidental expenses strictly relating thereto;" the latter to be devoted to emigration purposes. The "fourth part" of the land revenue above-mentioned to be employed for local improvements, to the extent of *one-fifth*,—and to the extent of *one-twentieth*, for the benefit and improvement of the natives; the remainder to be at the disposal of the commissioners.

A "commissioner for native titles," was to be *appointed by the commissioners*, to hear and determine the claims of all persons to lands bought by them from the natives before the proclamation of this act; and claimants dissatisfied with the land commissioner's award, were to be at liberty to *appeal to the courts and judges appointed by the commissioners*. In fact, all acquisitions of land by British subjects in New Zealand previous to the passing of this act, were to be at the mercy of the commissioners, and to be subject to such further regulations as to them should "seem meet." The commissioners were also to be authorized to buy up the "claims and rights" of a "New Zealand company," which was to have been formed in 1825, in consideration of the members of the said company "consenting to relinquish their claims" to a charter, and to "cede all their lands and rights" in New Zealand. What those lands and rights were was not stated; neither the money expended, nor the money to be paid, nor the nature of the promised charter to have been granted thirteen years previous; nor the names of the members who were to receive this remuneration,—it was however understood that several of the commissioners named in this bill of 1838, were the identical members (or their legal representatives) of the intended New Zealand Company of 1825.*

Two other clauses which ought not to be on the same day. The writer, Mr. White, was an active member of the New Zealand Association, and materially assisted in the preparation of the work entitled *The Principles, Objects, and Plans, of the New Zealand Association*. Without vouching for the character of Mr. White, attaching implicit credence to his assertions, or entering in detail into the very grave and explicit charges which he brings forward, I shall merely observe that he declares himself to have believed up to Thursday the 28th December, that the gentlemen of the committee were really actuated by *public motives* solely, whereas on that day he had heard four gentlemen of the committee, (whose names are stated, and who were well known to have actively exerted themselves both in and out of parliament in behalf of the Association,) avow distinctly that they entered into the Associa-

left unnoticed were—first, the exemption from custom duties in Great Britain of various articles, the growth or produce of New Zealand; second, the exemption from stamp duty of all bonds and other instruments executed by the commissioners.

The bill was opposed by her Majesty's ministers for many obvious reasons, some of which are forcibly stated in the subjoined extract from the speech of Viscount Howick:—

"If the parties interested in the measure think proper to advance these new funds, they may do so when they please; but it is a totally different question when the government are called upon to countenance and sanction, by an act of parliament, a measure of this kind, in which it is provided that the scheme may be carried on by means of a borrowed capital, bearing interest at £10 per cent." * * * "The government is not unwilling to consider, and if possible, to support, a measure for colonizing New Zealand, which shall have incorporated in it the two principles—first, of security against inveiglement of her Majesty's subjects; and secondly, security for the observance of justice towards the aborigines. This is the extent of the promise given by government. But this bill answers neither of these conditions; it affords security neither to the subjects of the crown, nor to the natives of New Zealand. I do not wish to enter at length into details; each clause, if possible, is more monstrous than the other."—*Vide Mirror of Parliament*, 1838, p. 4,919.

The House of Commons agreed in opinion with her Majesty's ministers, and the bill was thrown out by a large majority. It might naturally be supposed that its unconstitutional and unreasonable provisions were amply sufficient to account for its rejection, but we find Mr. Wakefield stating in his evidence, before the House of Commons' committee, 13th of July, 1840, that "the whole measure was opposed upon the grounds of a supposition which had been very diligently spread over the country, that this was a joint-stock company, having no object but to make money by what is called *land-sharking* in New Zealand."

Perhaps some of my readers may be reminded by the above uncalled for assertion, of the old French proverb, "*Qui s'excuse s'accuse*."

On the rejection of the bill, the New Zealand Association dissolved itself, but speedily reappeared under a somewhat altered form and denomination, for several of its most diligent promoters, aware that various causes, already related, were tending to the establishment of British sovereignty in New

Zealand, in which case the Crown would doubtless acquire the right of pre-emption with regard to all future purchases, and thus materially check, if not entirely stop their projects; knew that no time was to be lost, and formed themselves into a joint-stock association, which they at first designated the New Zealand Colonization Company, afterwards the New Zealand Land Company, and eventually, the New Zealand Company.

On the 4th of March, 1839, Mr. Standish Motte, as chairman of the New Zealand Colonization Company, solicited on its behalf an interview with the Marquis of Normanby (then secretary of state for the colonies), "with a view to obtaining through his lordship the fulfilment of a pledge," which he (Mr. Motte) alleged to have been given by Lord Glenelg, in December, 1837, for the grant of a royal charter of incorporation on certain conditions. By the "re-organization of the Association," the chairman declared that the required conditions had been fully complied with: he further stated that—

"A vessel has already been purchased, at a considerable expense, for the pioneer expedition and the surveying staff, which is still lying in the dock; and it is imperative to the interests of those who have sold their property and embarked their fortunes upon the pledge of the government last year, that the sanction of her Majesty's government to a charter should be immediately obtained, in order that the expedition should forthwith sail."

By what statements the persons alluded to in the above paragraph had been led to believe that the government were "pledged to protect and sanction" their rash proceedings, I do not attempt to conjecture. Lord Normanby replied (11th March, 1839) that the offer of a charter in 1838 had been distinctly rejected by the parties to whom it was made, who then—

"Applied to Parliament to obtain the powers which they had failed to procure from the Crown, and the application was unsuccessful. During the interval which has since elapsed, much additional information had been obtained, bearing materially upon the question which is in debate. Under such circumstances, Lord Normanby would hold himself entirely unfettered by the offer of the last year, even if the benefit of it were now claimed by the persons to whom it was made. This, however, is not the case. The list of the gentlemen with whom you are now acting, differs most essentially from the list which was laid before Lord Glenelg in the year 1838."

Lord Normanby however consented to receive the proposed deputation, on condition of its being distinctly understood that the government were "as free to consider and act upon this subject for the public

good as though the rejected offer of 1838 had not been made, otherwise he declined doing so until that preliminary question shall have been brought to a decision."

Whether the solicited interview did or did not take place is not recorded in the parliamentary papers. The following document to that from which I have just quoted, is a letter from W. Hutt, Esq., M.P., to the Marquis of Normanby, dated 29th April, 1839, requesting, on behalf of the New Zealand Land Company, that his lordship would furnish their principal agent, Colonel Wakefield, then on the eve of departing to New Zealand, to found a settlement there, with letters to the governors of the Australasian colonies, "similar to those which Lord Glenelg gave to Colonel Light, the commander of the exploring vessel sent to South Australia in 1836."* A copy of the instructions ostensibly issued to the agent was enclosed. Here it should be remarked, that the circumstances under which Colonel Light went to South Australia were *totally different* to those under which Colonel Wakefield was about to take his departure for New Zealand.

In August, 1834, an act of Parliament erected South Australia into a British colony; in May, 1835, Colonel Torrens and other commissioners were appointed under that act, by which an extensive territory was committed to their management, and they were authorized to sell the lands of the Crown, which they did up to March, 1836, the period when Colonel Light was sent out to select the site of a capital, and to survey the *British possession* of South Australia. (See Div. iv., p. 638-9.) The New Zealand Land Company, were, on the contrary, sending out an agent on a private speculation, for which they had unsuccessfully endeavoured, by various direct and indirect means, to obtain the sanction of the government. The present request must be included among the latter class of measures, the design being to obtain from the secretary of state an official recognition of their agent, or at least some expression which should imply tacit acquiescence in their proceedings. The manœuvre failed entirely, as will be seen by the following extract from the reply immediately made by his lordship to Mr. Hutt, through Mr. Labouchere, the under secretary of state:—

"Lord Normanby now, for the first time, learns,

* Parliamentary Papers—New Zealand, 1840 pp. 20, 22, 23.

DIV. V.

that a body of her Majesty's subjects are about to proceed to New Zealand, to purchase large tracts of land there, and to establish a system of government independent of the authority of the British crown. It is impossible that his lordship should do any act which could be construed into a direct or indirect sanction of such a proceeding. Abstaining from the expression of any opinion upon a measure so imperfectly developed in the papers which accompanied your letter, Lord Normanby thinks it necessary that the parties concerned should be distinctly apprized that her Majesty's government cannot recognise the authority of the agents whom the company may employ; and that if, as it is probable, the Queen should be advised to take measures, without delay, to obtain cession in sovereignty to the British crown of any parts of New Zealand which are or shall be occupied by her Majesty's subjects, officers selected by the Queen will be appointed to administer the executive government within any such territory. Lord Normanby wishes it to be further understood, that no pledge can be given for the *future recognition*, by her Majesty, of any *proprietary titles to lands within* New Zealand, which the company or any persons may obtain by grant or by purchase from the natives. On the contrary, with a view to the protection of the interests of the aborigines, as well as to the future prosperity of any colony which may be established in New Zealand, it is probable that application to Parliament may hereafter become necessary to provide for the investment in the Crown of any proprietary rights which may be thus acquired by private parties, with such equitable compensations to them as under all the circumstances of the case may appear expedient. Under these circumstances Lord Normanby must decline to furnish the Company with the introductory letters for which they apply."†

Notwithstanding this explicit warning, the Company resolved to persevere in their project, though by somewhat circuitous measures. Far from obeying the desire contained in the previous letter, by "distinctly apprizing" the unfortunate persons about to emigrate under their auspices, that they would do so without the sanction, if not in direct opposition to, the government of their country—the directors withheld a tact most important to all in any manner concerned in their proceedings; and on the following day (2nd May, 1839,) issued a prospectus of the New Zealand Land Company, capital £400,000, in 4,000 shares of £100 each; deposit, £10 per share. This was subsequently reduced to £100,000, in 4,000 shares of £25 each.—Governor, the Earl of Durham, deputy-governor, Joseph Somes (a large ship-owner), and a directory consisting of Lord Petre, Sir George Sinclair, M.P., and Sir Henry Webb, baronets, Colonel Torrens, Aldermen Thompson, M.P., and Pirie, John Abel Smith, W. Hutt, M.P., G. Palmer, M.P., Geo. F. Young, Russell Ellice, Stew-

† Parliamentary Papers, 1840; pp. 27, 28.

art Marjoribanks, and several other gentlemen of high standing.

There are few clauses in the prospectus in which some latent and unavowed object may not be traced; but the propositions especially requiring remark are the following:—

"(1st.) Very extensive tracts of most fertile land in situations highly favourable both for agricultural and commercial settlements, have been *already* purchased and secured for the purposes of this Company. (2nd.) And an expedition has also been fitted out and dispatched for surveying the coasts of New Zealand, making purchases of lands in the most eligible spots, and preparing for the arrival of a large body of settlers, whom it is proposed to establish on the Company's lands during the present year."

The first assertion is contradicted by an official statement made by the Company on another occasion (see p. 146); with regard to the second, it should be remembered, that the *Tory* did not sail from Plymouth until ten days after the date of this prospectus; and by the third, an unqualified announcement is made of the intention of establishing a large body of settlers on the Company's lands in the present year; whereas the Company, by their subsequent admission, possessed no claim to any land adapted for a settlement, and moreover, must have been aware, from the accounts of the missionaries and other credible eye-witnesses, of the difficulties attendant upon the legal purchase of extensive territory in New Zealand, and the length of time that, according to native custom, must be spent in bringing any such arrangement to a satisfactory conclusion. Yet the prospectus goes on to state that,—

"These important purchases, and the fitting out of the preliminary expedition (including the purchase and equipment of a fine vessel of 400 tons), have been effected at a considerable outlay, by parties to whom 600 paid-up shares have consequently been assigned for a transfer of their interests."

"The *directors* are to have the entire management and control of the funds, formation, proceedings, and affairs of the Company, and are empowered to enter into any arrangements whatever which they may consider conducive to the interests of this undertaking."

Thus, irresponsible power was assumed

* See Letter to the Directors of the New Zealand Company, from the Land-purchasers resident in the first and principal settlement.—Printed and published at Wellington, Port Nicholson, 1846.

† Mr. E. J. Wakefield states that his uncle was instructed to acquire land upon a far greater scale than was ever necessary for the purposes of cultivation, or even of speculation by individuals.—*Adventure in New Zealand*, vol. i. p. 17.

by the directors, of whom a quorum of three was sufficient to transact the most important business of the Company; no voice being accorded to the proprietors who contributed the capital, or to the purchasers of the so-called land-orders, who subsequently bitterly upbraided the directors for their "unfulfilled promises," "unredeemed pledges," and "reckless disregard of their interests."* The preliminary expedition (despatched in the vessel above alluded to, named the *Tory*, and purchased from Mr. Joseph Somes, the deputy-governor,) consisted of the company's chief agent, Mr., or by courtesy, Colonel William Wakefield, a gentleman who had obtained rank in Spanish mercenary service, and Mr. Edward Jerningham Wakefield, the latter being the son, the former the brother, of Mr. Edward Gibbon Wakefield, a naturalist (Dr. Dieffenback), a draughtsman (Mr. Heaphy), a surgeon (Mr. Dorset), and a New Zealander named Nayti, whom it was hoped would act as interpreter; but *no land-surveyor or engineer, and no minister of the gospel*. The *Tory* sailed from Plymouth on the 12th of May, 1839, with instructions to proceed direct to Cook's Straits, in New Zealand, and purchase as much land as possible on either side of the Straits. The reason of this haste was, doubtless, to obtain a title of some kind to very considerable territories† before the establishment of British sovereignty, and so acquire a claim to the "equitable compensation" of which Lord Normanby had made mention. Even before the departure of Colonel Wakefield, arrangements, as we have seen, were publicly made by the Company for the sale of lands which they were *about sending* an agent to obtain from the natives, in exchange for an assortment of goods, among which the chief, and unfortunately, the most tempting articles to the natives, were muskets, gunpowder, ball-cartridge, and tomahawks. Books and pamphlets were widely distributed throughout the United Kingdom, and the glowing descriptions in their pages‡ led many to believe that the mere purchase of a nominal section of 100

‡ Some idea of the delusions which were promulgated respecting New Zealand at this period, especially as regarded the neighbourhood of Cook's Straits, may be gathered from one instance of the exaggerated statements put forth, viz.—that the river which flows into Port Nicholson, now called the *Hutt*, was as broad and deep as the *Thames* at *London Bridge* for eighty miles, and "extended much farther."—Vide *New Zealand Association*.

acres and "a town lot," from the New Zealand Company, was equal to a prize-ticket in a lottery.

The prominent objects of the Company were stated to be "systematic colonization," the removal of a community, in all its component parts, from the mother country to the distant land; "concentration," or the settling down in one spot, instead of dispersion; a high price for land, abundance of labour and low wages, a prevention of the cottier or squatter system, so that the poorer emigrant might not become an owner of land until he became a capitalist, and the application of a duly regulated supply of labour to capital: these, stripped of many meaningless words and studiously ambiguous phrases, were, so far as I can ascertain, the leading points of the "Wakefield theory."

On the 1st of June, 1839, the Company issued proposals for the sale of nine-tenths of a township of 110,000 acres, in lots of 101 acres for £100, *each lot comprising 100 acres of country land, and one town section*: £75 per cent. of the purchase money was to be employed in emigration, and £25 per cent. in defraying the expenses of the survey and the management of the land, and to furnish a profit upon the capital invested. *One-tenth* of each township was to be reserved for the benefit of the natives: priority of choice for the whole of the sections to be decided by a lottery.

The mad haste with which intending emigrants entered into the scheme, is evidenced by the fact recorded by the Company in their first report to the proprietors, dated May, 1840, in the following terms:—

"The lands comprised in the preliminary sales were offered to the public *by anticipation*; but so strong was the public confidence in your directors, that in a few weeks the whole of the preliminary sections had been disposed of, and the Company had realized a land revenue of £99,990." Again—"The whole of the preliminary sections sold, from Nos. 1 to 1,100, have since experienced a considerable rise in value, according to the priority of choice, and the predilection of purchasers."

An able and well-informed writer, after quoting the above passage, says—"This certainly was a great proof of the confidence of the public in the directors, but says little for the foresight of the latter in accepting the money; for at that time *they did not possess a single acre at the site of their first*

settlement."* Of the quality of the land thus sold by "anticipation," both the buyers and the sellers could form but a very indistinct idea. Indeed, it is putting the most lenient possible construction on this transaction, to suppose that the directors were wholly ignorant of the comparatively small portion of available land in New Zealand, and especially in the neighbourhood of Cook's Straits; and had really no idea, that even should they succeed in acquiring a valid title to the thousands of acres which they were selling, at twenty shillings each, they were nevertheless cruelly deluding the purchasers, inasmuch as many of the 100 acre sections eventually proved to be composed of mountain and ravine; some of swamps, that required skilful and expensive draining; and others were so densely covered with timber (and that not, as was represented, of the valuable description called *Kauri*, which, so far as is yet known, grows only in the northern portion of the Northern Island), as to require an expenditure of from ten to twenty, and even forty pounds an acre in clearing them. The "town acre" to be given in, was an inducement which I cannot but think it was unworthy in any public body (even in a lottery for the avowed purpose of gambling) to hold out. A very small amount of forethought on the part of the speculators would have led them to see the folly of a proceeding calculated to benefit a few "lucky" individuals, at a heavy cost to the rest.

Let the reader imagine an isolated town, of nearly two miles square, laid out in a rugged wilderness, extending—say from Hyde-park corner to Hammersmith in one direction, and from Kensington to Kensal-green in another, and which, in all human probability, could not contain more than a few thousand inhabitants at the termination of some years; he will then see the impossibility of watching, lighting, draining, cleansing, paving, or carrying into execution any of the numerous conveniences which, to civilized men, have become requisites in a town. The few who, in the lottery of the New Zealand Company, could obtain the privilege of choosing a central position, or one near that selected for the residence of the agent, might, it is true, derive some of the advantages of neighbourhood in a strange land: the many, whose locations were widely

p. 112), the fact being, that it was fordable at the mouth, and not to be ascended in a small boat farther than eight miles, even with frequent portages.

* *New Zealand Company, its Claims to Compensation considered.* Seely and Co. 1845.

scattered, could not reasonably expect to find in them either the security for life and property, or any other of the benefits which may be attained, with comparative ease, by a concentrated and organized community. After selling the first 110,000 acres, another prospectus was issued, 30th July, 1839, in which the directors stated themselves to be—

"Now ready to receive applications for country lands, to the extent of 50,000 acres, in sections of 100 acres each, at the price of £100 per section, or £1 an acre, to be *paid in full, in exchange for the land order*, which will entitle the holders thereof to select country sections accordingly, either at the Company's principal settlement, or at Hokianga, Kaipara, Manukau, the islands of Waiheke and Paroa, the borders of the Thames, or any other part of the present or future territories of the Company, so soon as the requisite surveys thereof shall have been completed."

At the period when these prospectuses were issued, the Company had acquired no more right to sell 110,000 and 50,000 acres of land in New Zealand, than they had in England, France, China, or any other foreign country. Yet, without waiting for tidings of the proceedings of their agent, or even of his safe arrival in New Zealand, ship after ship full of emigrants was despatched to a rendezvous in Cook's Strait, where it was "anticipated" Colonel Wakefield would have made arrangements for their reception. The first of these, the *Cuba*, left London in the beginning of August, 1839, with a surveying staff, (consisting of a principal surveyor, and three assistant surveyors); other vessels followed in such close succession, that between the departure of the *Tory*, in May, 1839, and February 24th, 1840, as many as twelve ships were sent out, laden with 216 first and second-class cabin passengers, and 909 labourers, "without any certainty of being able to give them secure possession of a foot of land,"* or provide them with even temporary shelter on their arrival!

* Vide *New Zealand Company's Claim to Compensation considered*, p. 15.

† A map, published by Laurie, was referred to by Mr. E. Gibbon Wakefield, in July, 1840, (House of Commons' Committee), as showing the extent of the territories on either side of Cook's Straits, acquired by Colonel Wakefield in 1839, and to which the Company considered they had an *unobjectionable title*. The portion north of Cook's Straits was called *North Durham*; that to the south, *South Durham*. According to the coloured line on the map, the possessions thus acquired comprise *four hundred miles*, from Albatross Point, in North Island, to Bald Head, in South Island, and include *Kapiti*, and all other islands in Cook's Straits, the whole coast line north

Meanwhile the *Tory* had (17th August, 1839), safely and speedily reached her destination in Cook's Straits. Up to the 30th of August, Colonel Wakefield, according to the garbled extracts from his journals, appended to the report of the New Zealand Company, does not seem to have commenced any treaty with the natives for the purchase of land. Some of them had visited the ship, and he had been several times on shore. On that day, however, he appears to have become acquainted with a person named Barrett, who had followed the occupation of a whaler for some years in New Zealand, and was living with a native woman.

By his assistance, Colonel Wakefield, in the space of very little more than two months, concluded three nominal purchases of land, "extending from the 38th to the 43rd degree of latitude, on the west coast; and from the 41st to the 43rd degree on the east coast."†

The "consideration" paid by Colonel Wakefield, on obtaining the signature, by a few chiefs, of the three deeds by which a territory as large as Ireland was supposed to be wholly and legally alienated from a population (according to Mr. Clarke) of *thirty thousand souls*,‡ each one of whom had a vested interest in it, and, according to native usage, a voice in its disposal, is not the least exceptionable part of the proceedings of the New Zealand Company.

The following is a list of the articles bartered for the lands mentioned in the deeds of purchase, dated respectively the 27th September, 1839, 25th October, 1839, and 8th November, 1839, to the first of which was appended a condition that a portion of the land ceded by them (the chiefs), equal to one-tenth part of the whole would be reserved and held in trust by the New Zealand Company for the future benefit of the said chiefs, their families, and heirs for

and south of Cook's Straits, and east and west of North and South Durham, from Cape Turnagain, on the north, to near Bank's Peninsula, on the south. There was no exception, in this map, either in favour of native or any other previous occupant.

‡ According to the census of the population by tribes, prepared by Mr. Halswell the population in the districts called by the New Zealand Company North and South Durham, numbered 20,000, of whom upwards of 5,000 were "fighting men;" and Colonel Wakefield himself names eighteen tribes residing at twenty-four different places in North and South Durham, whose numbers he estimates in November, 1839, at 6,650, possibly referring only to the male adults.

ever. The second and third deeds likewise contained a promise of native reserves, but *the quantity* was not specified.

The first point for remark on the foregoing document is the fact that a professedly

* The author of the *New Zealand Company's Claims to Compensation Considered*, says—"The list of articles which formed the consideration of the purchase is worth perusing, and the distribution of some of them is really amusing. It will not escape observation, that the parties to each deed obtained a supply of razors and shaving boxes; but those only who signed the first got the shaving brushes; that while the parties to No. 1 got the sealing-wax, parties to No. 2 and 3 got the paper; and that of the three sets, the most fortunate were those who executed the first deed; for they received all the Jews' harps. in number 144 (possibly to encourage a taste for music in the vicinity of the capital), besides twelve umbrellas, which at the celebrated review, on the

Christian company in London send out their agent with "200 muskets, 16 single-barrelled guns, 8 double-ditto, 15 fowling-pieces, 81 kegs of gunpowder, 2 casks of ball cartridge, 4 kegs lead slabs, 24 bullet moulds, 11 quires cartridge paper, 200 cartouche boxes, 1,500 flints, and 300 tomahawks," to purchase land from a people among whom Christian missionaries had for years been striving to spread the peaceful influences of the Gospel. I have, I believe, before mentioned the firmness with which the members both of the Church and Wesleyan mission refused to procure even the necessaries of life by supplying the aborigines with instruments of warfare; more than this, they would not even suffer their blacksmiths to repair a gun. No wonder that the keen-witted natives should remember the designation they had formerly given to the most depraved of their early European visitors, and say of the emissaries of the New Zealand Company, "they cannot be Christians—they must be *'the devil's missionaries*, who bring us muskets and gunpowder."† Some members of the select committee of the House of Commons on 17th July, 1840, endeavoured to obtain evidence from Mr. Ward, the secretary of the New Zealand Company, as to the actual cost of these "twenty million acres;" but the question was, in legal phraseology "fenced;" Mr. Ward would not return a direct and explicit answer; he said the value of the goods sent out in the *Tory* was about £9,000, and a second adventure in the *Cuba* amounted to £8,000—"a portion had been given to the chiefs and other natives by the Company's agent," the "rest of the goods remain in the hands of the Company's agent in New Zealand."

The testimony of Mr. Carrington, who was employed by the company as chief surveyor of the Taranaki District, and whose personal character and ability as a surveyor,

occasion of christening the flag-staff, they did not fail to exhibit."

† It was not only, however, in 1839 that the Company supplied the New Zealanders with instruments of destruction. At Manawatu, on 2nd February, 1842, Captain M. Smith, "on behalf of the New Zealand company," furnished to the natives "59 double-barrel and 16 single-barrel guns, 10 large pistols, 24 bright and 50 handled tomahawks, 30 barrels of powder, 4 bullet-moulds, 18 powder-horns, 12 metal powder-flasks, 22 boxes percussion caps, 6 dozen gun-flints," &c. At Wangaroa, in May, 1840, the Company gave the natives "10 double-barrel guns, 6 fowling-pieces, 50 casks of powder, 68 powder and shot holders, 16 bullet-moulds, 1,000 flints, 18 car-

have been attested by them, throws considerable light upon the subject. He says—

“Not one pound that I ever heard of up to the time of my departure from New Zealand in September, 1843, was paid to the natives;” “and I am further assured by one of the Company’s agents, who witnessed all the negotiations with the natives, that of the amount of £14,603 of goods (sent out in the *Tory* and *Cuba*) intended for the natives, only £1,500 at the outside was ever given them, and this to purchase a territory as large as Ireland.” “Hort and Co., auctioneers at Wellington, had sales of these very goods for three successive days, and realized for them £7,000.”*

Now, on the face of the thing it is manifestly absurd to suppose that a shrewd, intelligent, warlike people, who even in the time of Cook evinced some degree of civilization, and were to a certain extent tillers of the soil, and who since then had become accustomed to trade with Europeans, not for goods only, but for money in exchange for land, and who had been from the very first remarkable for the jealous watchfulness with which they guarded their territories alike from internal and external aggression,† should in the space of two months alienate “twenty million square acres,” including all their paha or inhabited villages, with the cultivated ground attached, even their burying-places and all other *tapued* or sacred spots, for the paltry consideration above named. It is next to impossible to believe that even at a far heavier cost, all native titles and right to such extensive territories could have been extinguished in the time and manner described by Colonel Wakefield.‡

A part of the coast was seen from the decks of the *Tory*, a few chiefs paddled off in their canoes, or swam through the surf: they were asked the names of such-and-such points, such-and-such districts of country,

touché boxes, 2 casks of cartridges, 3 bundles of cartridge paper,” &c. At Taranaki, in February, 1840, the Company gave the natives “fifty bright guns, 40 casks of powder, 1 cask of ball cartridges, 12 patent cartouche boxes, 20 powder horns, 80 tomahawks,” &c. “A case of guns,” valued at £200, was also promised to the chiefs by Barrett on behalf of the Company. At Nelson Captain Wakefield, R.N., gave the natives in 1841–2, “42 double-barrel guns, and 60 kegs of gunpowder.” I might multiply instances to show how directly the proceedings of the Company were in contrast with the missionaries, who instead of instruments of warfare were distributing bibles and prayer-books.

* See printed letter in the library of the Colonial office, dated 25th March, 1845, addressed to Viscount Howick, as chairman of the Select Parliamentary Committee on New Zealand, written by Mr. Carrington, to substantiate the statements made by him before the committee.

of streams or plains, or distant mountain ridges: all was written down, much more even than the eye could reach, and the question was then put to them—would they sell those territories, headlands, rivers, mountains, points, coasts and islands?

At this period of the negotiation (to take the most lenient view of the case), it is possible that a complete misunderstanding arose between the contracting parties; the would-be buyers intending to purchase the whole of the territory they themselves referred to—by sight—by description, or by the map. Those who were willing to sell “land” (indefinitely), intended to point out certain localities where they would sell it—the precise boundaries to be settled according to the only mode which they knew, or had practised; namely, by meeting, in numbers *on the very ground in question*, pointing out the limits in detail; after days, at least, of discussion, and shewing what places would be retained for themselves. Without this latter reservation how were they to exist? they could not go elsewhere, for all land had owners, and the provision to be at some future time afforded them by means of the much talked of “native reserves,” appears to have been from the first, shadowed forth to them only in very dim and distant perspective.§ Supposing the majority of the chiefs to have taken this view of the case, it is easy to understand this otherwise incomprehensible transaction. Some of them probably had a more enlarged perception of the meaning of the deed they were requested to sign, but the choice assortment of muskets and red blankets, tomahawks, umbrellas, Jews’-harps, and tobacco, spread out on the deck of the *Tory*, silenced their scruples, and

† War has been known to originate between neighbouring tribes in resentment of the slightest trespass on their respective lands. For instance, the killing of rats as game by one tribe on the territory of another has alone proved a *casus belli*.

‡ App. to 12th Report of New Zealand Company.

§ Commissioner Spain says—that the interpretation of Richard Barrett to the Maories, at the time of the alleged purchase of the Port Nicholson District, “was not calculated to convey to the natives, who were parties to the purchase-deed, a correct idea of what lands that instrument purported to convey, or of the nature or extent of the reserves that had been made for their benefit; and this will in a great measure account for the very determined manner in which the natives generally, in the district, opposed the occupation of lands by the Europeans, and denied the sale to Colonel Wakefield.”—Report of Mr. Commissioner Spain, March 31, 1845, Parliamentary Papers on New Zealand, 8th April, 1846. p. 3

they were ready to put their mark to any document whatsoever; though it should include the sale of the whole three islands of New Zealand, knowing (or at least believing) all the while, that no tract belonging to a tribe could be alienated without the consent of every member. Colonel Wakefield, on his part, expressed himself perfectly satisfied with the arrangements which he had been enabled to make by means of the "*unprecedented liberality*"* of the Company, and the directors, delighted with the easy manner in which they had acquired "*an unimpeachable title to one-third of New Zealand*," voted their agent a present of one thousand guineas, and raised his salary to £1,000 per annum.

Very different views respecting the validity of the assumed purchases of the New Zealand Company, were, however, entertained by persons of character and position, who, from various circumstances, must have had the most favourable opportunities of forming a correct judgment on the matter. Some of these testimonies, I feel it right to adduce here, in evidence of the unsound basis upon which the Company were building, and as the best means of preparing the reader for the ill success which attended their after efforts.

The first authority on this subject, namely, Mr. Spain, the commissioner specially appointed by the Crown to investigate and determine the validity of titles to land acquired from the natives, declares that—

"*All the purchases of the Company were made in a very loose and careless manner;*" he adds—"the object of the Company's agents, after going through a certain form of purchase, seems to have been to procure the insertion in their deeds, of an immense extent of territory; the descriptions of which were framed from maps, and by obtaining the names of ranges of mountains, headlands, and rivers, and were not taken from the native vendors; such descriptions were generally written in the deeds before the bargain for the purchase was concluded: these parcels contained millions of acres, and in some instances degrees of latitude and longitude. The agents of the Company were satisfied with putting such descriptions in their deeds, without taking the trouble to enquire either at the time of, or subsequently to the purchase, whether the thousands of

aboriginal inhabitants occupying the surface of these vast tracts of country, had been consenting parties to the sale. * * * I am of opinion that the greater portion of the land claimed by the Company in the Port Nicholson District, and also in the district between Port Nicholson and Wangamī, including the latter place, *has not been alienated by the natives* to the New Zealand Company; and that other portions of the same districts have been *only partially alienated* by the natives to that body. * * *

I am further of opinion that the natives did not consent to alienate their pāhs, cultivations, and burying grounds."† * * * "In point of sufficiency of proof, as regards the important items of boundaries, explanations, and interpretation to the native vendors of the precise nature and extent of the transaction, and subsequent adherence to and acknowledgment of the bargain by the aborigines, the claims of the New Zealand Company were as far below the general standard of evidence on such points, in the cases of private claimants, as they generally exceeded them in extent and magnitude of the territory claimed."‡

Another witness§ thus exposes the worthlessness of the "*unimpeachable title to the vast but thinly populated territory*" supposed to have been obtained by Colonel Wakefield's transactions:—

"I have seen a copy of one of the Company's original deeds, and have no hesitation in saying that it never was interpreted to the natives; the persons employed as interpreters were incapable, even had they been disposed so to do; and it is morally impossible that the natives should consent to such a transaction, even on terms far more advantageous than those offered by the Company: and instead of the transaction being unexampled in this country for the spirit of justice and openness which characterizes it (as alleged by Colonel Wakefield), I may safely say, that the immense disparity between the paltry consideration given, and the vast extent of the country claimed, is without a parallel, excepting, perhaps, the case of Mr. Wentworth, who, wishing to embarrass Sir George Gipps, pretended to have made a purchase from certain natives of the greater part of the Middle Island, upon similar terms to those of the Company." * * * "So far from the assumptions put forth by Colonel Wakefield being attended with anything like probability, the assertion of his right to even *one-fiftieth part of the land is treated by the natives as chimerical*. The scantiness of the population, upon which so much stress has been laid, will perhaps be better understood, when it is known that *upwards of thirty thousand natives reside within the limits claimed by the Company*: and granting it to be possible to effect such a purchase, it would, on the most reasonable computation, require years to complete it."||

* In a letter from Colonel Wakefield to the secretary of the New Zealand Company, dated Wellington, 26th February, 1841, we find the following passage, which requires no comment:—"The first expedition despatched by the Company to this country acquired a vast territory, in strict accordance with the hitherto recognised form of obtaining land herein, and with the usages of the aborigines. It moreover gave to the aborigines more than the full market and a *satisfactory price* for the land ceded."

† Mr. Commissioner Spain's Report, see Appendix to the Report of the Select Committee of the House of Commons, 1844, p. 305.

‡ Mr. Commissioner Spain, 19th November, 1843. Parliamentary Papers on New Zealand.

§ Mr. George Clarke, Protector of Aborigines.

|| Letter dated 26th October, 1843. See Appendix to Report from Select Committee on New Zealand, 1844, p. 284.

Mr. R. D. Hanson, who was sent out in the *Cuba* by the New Zealand Company, to arrange their land purchases, says :—

"The attempt to construe a purchase of twenty million acres at the rate of *sixpence per thousand acres*, so as to deprive those natives of their lands who have not signed the conveyance, is necessarily absurd and unjust."

It would be easy to multiply evidence of the same bearing, in proof, if the fact were not self-evident, that Colonel Wakefield, in his nominal acquisition of 20,000,000 acres, had grasped a shadow; a limited territory, fairly purchased, at thrice the cost, would have been a substance far more beneficial to the Company. Possibly, both the agent and the directors hoped that the settlers, on their arrival, would so over-awe the natives by their numbers, as to be suffered to locate themselves with impunity, and that after inquiry into the legality of their purchases on the part of the crown, would be by the same means rendered less scrutinizing, "possession being nine-tenths of the law." If so, they were greatly mistaken, and especially with respect to the natives, who manifested from the first an unwavering determination to oppose the attempted usurpation of their respective territories.

The extracts above quoted refer to the general invalidity of the titles acquired by the company; in detailing the establishment of the settlements of *Wellington, Nelson, and New Plymouth*, it may be necessary to show, that in each instance the unauthorised occupation of land was a leading cause of the sufferings of mind and body, the wreck of property, and even loss of life, experienced by the unfortunate colonists.

The first (so-called) purchase by Colonel Wakefield was the Port Nicholson or Wellington District, and of this formal possession is stated by him to have been taken on the 30th of September, 1839. From his journal we learn that he landed with his party under a salute of twenty-one guns from the *Tory*, and the *New Zealand flag* (not the *British*), was hoisted at a spot where an immense flag-staff had been erected, and at the main of the ship, simultaneously. A war-dance was then performed by the natives, armed with their newly-acquired muskets, after which (Mr. E. J. Wakefield informs us,) the whole assemblage partook of an ample meal from "the joints of a pig, which had been sacri-

ficed for the occasion." The English then "drank the healths of the chiefs and people of Port Nicholson in bumpers of champagne, and christening the flag-staff, took formal possession of the harbour and district for the New Zealand Land Company, amidst the hearty cheers of the mixed spectators."* No such public demonstration appears to have accompanied the conclusion of either of the subsequent deeds of purchase. Yet how thoroughly untenable even the first really was, may be understood from the following statement made by Mr. Hanson :—

"The original purchase of the district of Wellington on the part of the New Zealand Company, has been fully investigated by the Commissioner appointed for that purpose, and his inquiries demonstrated the *worthlessness of their title*. The evidence taken before him *completely disproved* those statements of the *universal assent* of the natives, which were published in Colonel Wakefield's Journal, and upon the faith of which the claims of the Company were originally vested." "The original agreement for the purchase of the Wellington District was made only with the Ngatiawa natives residing on the *shores* of the harbour, who could only transfer such rights as they possessed; at that time they only occupied the land in the immediate vicinity of the harbour, their farthest cultivation not extending to more than a mile-and-a-half from the beach." The whole of the upper part of the valley of the Hutt was claimed by a chief named Kaparatchau, whose rights were not even known by Colonel Wakefield, until about one year and-a-half after the date of the first purchase, which he assumed to have made of the whole."

It must not, however, be supposed that the proprietary rights of the natives were the only ones extinguished by Colonel Wakefield; on the contrary, those acquired by missionaries, whalers, and others, on either side the straits, fell under the same monopolising grasp.

One illustration will suffice :—Some time before the arrival of the *Tory* the aborigines in the vicinity of Port Nicholson having manifested an earnest desire for missionary instruction, two members of the Wesleyan mission (the Rev. Mr. Bumby and Mr. Hobbs) proceeded thither for the purpose of establishing a station. A suitable spot was selected and purchased, and formally tapued, and a part of the price was paid down to the chiefs, who owned it as an *earnest* for the purpose of securing the purchase to the Missionary Committee according to New Zealand law and usage. Six native teachers, with their families, were placed upon the land to keep possession of it, and to com-

* *Adventure in New Zealand*, vol. i., p. 99.

mence the work of instructing their countrymen until English missionaries should arrive.* On the return of the Rev. Mr. Bumby to the Hokianga, an English missionary was sent to take the management of the new station; but before he could reach it, the Agent of the New Zealand Company had arrived, bought the Society's land *over again* from the principal chief, Warepori, and taken possession of it on behalf of the Company, together with the "houses and chapels," which, according to his own account, "the missionary delegates" had built upon the land.† The remonstrances made by them so far prevailed, that Colonel Wakefield at first deemed it right to offer some compensation, but the remark of the unconverted savage, Warepori—"Have you not already paid for the land and everything upon it?" quieted his rising scruples, and in the published extracts of his journal, under the date 4th December, 1839, we find the following entry:—

"He (Mr. Bumby) visited Port Nicholson just before I was there, and conceived that he had secured the land at Thorndon, till I had informed him that the chiefs had disregarded the verbal taboo he had made, and sold the entire place to the Company."

When the intelligence of this transaction reached the Wesleyan Society they immediately reported it to Lord John Russell, stating that the injury of which they complained had not originated in mistake, but had been knowingly inflicted by the principle of "might against right," a principle which, if silently submitted to, would probably involve in ruin all their other establishments in New Zealand.‡

Lord John Russell, in his reply, dated July, 1840, stated that—

"Her Majesty's ministers had never recognised the New Zealand Company as a legally constituted body, nor acknowledged the validity of the titles which that body may assert to any lands in New Zealand; but have on the contrary instructed the governor of New South Wales and Captain Hobson to take the necessary measures for ascertaining the validity of titles to any lands claimed by any of her Majesty's subjects. Lord John Russell, therefore, anticipated that 'the necessary means for rendering justice to all parties concerned,' have been already taken, but adds that he will 'however, transmit to Captain Hobson a copy of this letter, instructing him to take such measures as justice may require, and as it may be lawful for him to adopt, for the protection of the missionaries.'"

* Parliamentary Papers, New Zealand, 1840; Appendix, page 152.

† See despatch of Colonel Wakefield, published in the *New Zealand Journal*, 5th June, 1840.

If the rights and claims of an influential body were thus contemptuously treated by Colonel Wakefield, it may easily be imagined that those of private individuals did not receive more consideration at his hands. It would be unjust, however, to make him the scape-goat for the sins of the directors, who had sent him out as their agent, with directions much resembling, in spirit, the often-quoted injunction of Sir Pertinax M'Sycophant—to *get land, honestly if he could; but to get it*: and they appear, even before he left England, to have determined that their first settlement should be established somewhere on the northern side of Cook's Strait, probably on the embouchure of the Hutt, which they (as has been before shown) assumed to be a navigable river. Some amount of discretionary power was probably entrusted to Colonel Wakefield on this most important point; but it was neutralized by the rapidity with which large bodies of emigrants were hurried after him, without leaving him time, under the most favourable circumstances, to do more than obtain territory where he could, and how he could. This, as we have seen, he, to some degree, succeeded in doing: but as to any arrangements made for their reception, or any allotments surveyed, as they unquestionably should have been, in readiness for the settlers on their arrival, the *Tory* might as well have been lost at sea, as she afterwards was, and might have already been, for anything the directors knew to the contrary, when they despatched nine large ships, heedless of the risk to which they were exposing the emigrants, and of the heavy responsibility they were themselves incurring. According to their own prospectus and reports, all this was done in pursuance of an "exclusively commercial" speculation, the desire of gain being the avowed object of the New Zealand Company.§

For this candid admission, the public are probably indebted to the able exposition, by Mr. Coates, of the much-vaunted "patriotic motives" of this body (or at least a large number of its members), when "agitating" (to quote Mr. O'Connell,) under the name of the New Zealand Association.

The *Cuba*, with the surveying staff, arrived in New Zealand only ten days before the first settlers, who (we learn from one of

‡ Parliamentary Papers, New Zealand, 1840; Appendix, page 152.

§ See First Report of the New Zealand Company, May, 1840.

their number*), on landing at Port Nicholson, looked with bitter disappointment upon "the steep and barren hills which surrounded them:" and when, in addition to the physical disadvantages of their position, they discovered the invalidity of their titles to land, a re-emigration to South America was actually proposed and planned, and that not by a wild visionary, with all to gain, and nothing to lose, but by one (the late Mr. Molesworth) who was placed by the Company in the very first class of their settlers, to which he was entitled by rank, property, enterprise, and intelligence. The spot selected by Colonel Wakefield for the site of the town, then to be called Britannia, was situated at the entrance of the valley of the Hutt. The choice proved to be very injudicious, both from the nature of the ground, and the violence of the surf, which was so great, that lives were lost in attempting to land. A public meeting was consequently held in March, 1840, and the removal of the town to Lambton Harbour, (seven miles distant), on the opposite side of the bay, was determined upon. In carrying this resolve into execution, the earliest collision (of which there is any record) occurred between the new settlers and the natives. The site of the town now called Wellington was fixed at the place previously alluded to as Thorndon, which contained no less than five occupied pāhs. The natives strongly opposed the surveying of the territory, declaring that they, the rightful owners, had never sold it, and that E'Puni and the Ngatiawa tribe could have no authority to do so. They were, however, "overawed by the number of surveyors and settlers" who appeared, upon their

offering resistance, and took forcible possession even of their cultivations and pāhs, the largest of which (Te Aro) was selected as the site of the custom-house, while two or three others were included in different allotments.† The land purchased by Mr. Bumbly on behalf of the Wesleyan Society, on which, as we have seen, a chapel for the performance of divine worship had been erected, was fixed upon as the fittest spot for a market-place.

This was one of the few instances in which the officers of the Company succeeded in gaining possession of land when resisted by the natives; but it had the effect of creating great distrust in the minds of the latter towards the settlers, in whose path a serious and lasting obstacle was thus placed, in addition to the many they had already to encounter. No less a period than *six months*, we are informed by Mr. Petre, elapsed between the arrival of the first body of settlers, and the delivery of *town-land* to those who had purchased it in England—the interval must, in many cases, have been much longer; and with regard to the country sections, all they could obtain was, permission "to squat" on sufferance where the natives would let, or rather wanted power to hinder them. Even when, at length, they received their allotments, the character of the land was too generally calculated to damp the energies of even British colonists.‡ Some (like Mr. Child) quitted the settlement in despair and disgust, but many could not do so, having embarked their all in a lottery in which, *for them, at least*, there were few prizes and many blanks. Yet they struggled manfully, even though month by month

* *New Zealand and the New Zealand Company, and a consideration of how far their interests are similar*, by Theophilus Heale, Esq., London, 1842; p. 5.

† *Vide* evidence of Mr. Child before the Committee on New Zealand of 1844, p. 226. This gentleman was one of the many purchasers of a "town acre and a country section" from the New Zealand Company, intending to establish himself and several members of his family in the intended settlement, but returned in disappointment on finding the country was very different from what he had been led to expect."

‡ The principal settlers at Wellington, when referring to the worthless character of the lands which they had been compelled to select, thus address the directors of the New Zealand Company:—"It cannot be a matter of surprise to you that such is the case, for you never made the slightest effort to ascertain the capabilities of the different districts before you called upon us to select our lands. Owing to the small surveying staff [consisting of a principal surveyor and three assistants] originally sent out by

the Company, followed as it immediately was by the settlers, there were neither the means nor time for exploring the country. Land was taken and surveyed wherever it could most easily be found, without any reference to its quality, accessibility, or proximity to the town, and *without any regard being had to the numbers and feelings of the native population.*" The settlers also complain that they "were scattered over a tract of country 120 miles in length, and placed in the very spots where the natives are the most numerous and the most opposed to them;" and declare moreover that had the Company explored the country, as they were bound to have done, if they had seriously intended to fulfil their conditions (into which they entered), the Wairarapa valley, forty-five miles from Wellington, containing not only 700,000 acres of the richest agricultural land, but also immense tracts of country peculiarly adapted for stock and sheep farming, might have been purchased more easily and more completely than perhaps any other in the whole of New Zealand, as there was scarcely a single native in the whole valley.

the remains of their capital was passing away in the purchase of the bare necessities of life, clinging to the belief that the Company would eventually fulfil their engagements, and were, to that end, exerting their large means and powerful influence to the fullest extent in behalf of their "First and Principal Settlement;" relying meanwhile on the promise not to found any other until three years after its establishment, and little dreaming how speedily that pledge was to be violated by the formation of New Plymouth and Nelson. Besides this, a belief had been sedulously instilled into their minds that *Wellington could, would, and should*, by some means or other, be made the Capital of New Zealand. And this *ignis fatuus* they pursued as a forlorn hope, notwithstanding the manifest ineligibility of Port Nicholson for the site of the metropolis of an extensive colony.

It should here be stated, that on leaving England the emigrants had assented to and subscribed a document, according to which a provisional government was to be formed on their arrival in New Zealand, of which Colonel Wakefield was to be the head. This proceeding was publicly announced in the *Morning Chronicle*, upon which Lord John Russell desired to see a copy of the document in question, in order that it might be submitted to the law officers of the Crown, for their opinion how far persons acting under it would be justified by law. The Directors not complying with this request, after some further correspondence, received from his lordship an explicit warning, that in the event of the New Zealand Company acting in a manner contrary to law, he would not consider himself precluded by anything that had passed, from "directing legal proceedings to be instituted against that body, or against any member of it."

The directors then took the opinions of Sir Thomas Wilde, and other lawyers of eminence, who at once declared the agreement to be illegal, and advised immediate notice of its illegality to be given to any person likely to incur liabilities by acting under its supposed authority. It is scarcely possible to believe, that a Company, numbering among its members, men well versed in colonial policy, and by no means deficient in legal acumen, should have needed to be informed that an association, which the ministers of the crown had *deliberately refused to recognise*, could not be

justified, in founding a colony (for it is of more importance than appears at the first glance, that it was termed a colony and not a settlement); establishing an organized government armed with authority in all matters, civil or criminal, and invested with power from the levying of taxes to the infliction of the penalty of death; of which government, their principal agent was to be in all cases the president. Although this bold attempt to constitute an *Imperium in Imperio*, in defiance of the prerogative of the crown, was immediately denounced by its responsible minister, the emigrants had sailed before he became aware of it; for it is worthy of remark, that not one word about a provisional government appears to have been said *until* the moment of their departure, when the important document was produced, ready cut and dried; read, and placed upon the capstan for signature, whereupon, we are informed, "every man seemed to concur in the propriety of the proposed code of laws," and "not one hesitated to put his name to it," having, however, first been assured on the part of the Company, that this illegal compact was *absolutely indispensable to their security and happiness.**

On reaching their destination, the "*Provisional Committee*" appointed in London by the Company, proceeded to organize a government, formed themselves into a "*Special Council*," and assumed jurisdiction, not only over those who had bound themselves to obey it, but over the other settlers, and crews of ships in the harbour.

The arrival of Captain Hobson, as lieutenant-governor, and the ratification of the treaty of Waitangi, did not stop this dangerous innovation on the rights of British subjects, of which one instance recorded by Mr. Petre, a member of the *Special Council*, may serve as an illustration.

A warrant was issued against a Captain Pearson on the complaint of a gentleman who had chartered his vessel from Van Diemen's Island to New Zealand. Captain Pearson was seized, and on two armed boats putting off from his ship to rescue him, "the settlers turned out to support the constables in the discharge of their duty," and forcibly conveyed their captive before the so-called magistrate, who on his refusal to acknowledge the competency of the court, committed him for trial, and (according to Dr. Martin) placed him in irons. Through what

* Parliamentary Papers on New Zealand, 1840.

Mr. Petre styles "the culpable negligence of the constable," he managed to effect his escape, and hastened to the Bay of Islands; where he informed Captain Hobson of the state of affairs at Port Nicholson. Intelligence to the same effect from various sources likewise reached the lieutenant-governor, whose conduct at this critical juncture has been already related (see p. 142). This brings us to the period when British sovereignty was proclaimed over the islands; but before resuming the general history of New Zealand, it is necessary to relate an incident which occurred about this time, and which gave some colour of truth to an idea most industriously circulated by the organs of the Company—namely, that France was on the eve of founding a penal settlement in New Zealand, and occupying the country, when the timely arrival of their agent in Cook's Straits frustrated the attempt, and preserved these fine islands to the British crown. So adroitly was this pretext put forth to cover the proceedings of Colonel Wakefield, that many who though necessarily but imperfectly acquainted with them, yet knew enough to disapprove, were inclined to look leniently on the means for the sake of the end. For my own part I confess it was not till after careful examination that I discovered the groundlessness of the assertions set forth on this, as on many other points by the Company.

The first reason for spreading this fallacy appears to have been for the purpose of stimulating in the British public the desire to colonize New Zealand, as the only means of preventing the French from doing so, the fact of the large and increasing numbers of British subjects located and locating there, being quite overlooked. In various ways, but always in general and vague terms, this notion was circulated, and in the first report of the directors of the New Zealand Company, reference is adroitly made to the "alleged intentions of the French government to plant a penal settlement at Banks' Peninsula." In a petition signed by some of the leading merchants, bankers, and shipowners of London, soliciting the Crown to take measures for the colonization of New Zealand; it is stated that a company had been formed in France, with a capital of one million francs, to form a settlement there, and that an expedition had been dispatched for that purpose, "which expedition" the memorial adds—

"Is reported to have had an armament of forty

sailors from the French navy, and aid of money from the French government, by whom the leaders of the expedition are said to have been instructed to report on the fitness of Banks' peninsula as a place of transportation for convicts, and, at all events, to reserve for the use of the French government one-fifth of the territory which they might acquire in this part of the British dominions."

The committee appointed to inquire into the statements contained in the petition, (July, 1840,) closely investigated this matter, and after much questioning, the chairman (Lord Eliot) asked Mr. Gibbon Wakefield whether any intention had been expressed by France of establishing a penal settlement in any part of New Zealand? The reply was, "*There is no evidence of any such intention being entertained by France.*"

To understand the importance of the above admission, it should be borne in mind, that some members of the family of this witness were permanent residents in France, and active promoters of his views in the public press of that, as also of our own country; this and other circumstances, render it probable that Mr. Wakefield was, at the time, well acquainted with the following circumstances which led to the emigration of a small body of French colonists to New Zealand.

The master of a French whaler, Langlois by name, who had been engaged with others of his countrymen, for several years in fishing and sealing on the shores of these islands, on his return to France, professed to have purchased about 30,000 acres on Banks' Peninsula, upon the 23rd of August, 1838, from the native chiefs, having given them merchandise to the value of 150 francs (£6 sterling), and contracted to make a further consideration to the value of £234 sterling, on taking possession of the land. Two mercantile houses at Nantes, two at Bordeaux, and three gentlemen of Paris, associated themselves with Langlois, under the denomination of the Nanto-Bordelaise Company, and despatched a whaling vessel, the *Compte de Paris*, with thirty men, eleven women, and sixteen children, to Akaroa (Banks' Peninsula, Middle Island), all the emigrants being of the lowest class, with the exception of the agent, M. de Beligny, a botanist and mineralogist, from the *Jardin de Plantes*, of Paris. A few days before the *Compte de Paris* reached her destination, namely, on the 10th of August, 1840, Captain Owen Stanley, in H.M.S.

* Appendix to Report to Commons' Committee on New Zealand, 1840; p. 136.

Britomart, arrived there under orders from Lieutenant-governor Hobson, with two police magistrates, and visited the only two parts of the bay where there were houses. The British flag was hoisted, and a magisterial court held; the same was done at three whaling stations at the south side of the peninsula, and the sovereignty and occupancy of Britain formally proclaimed. On the 15th the frigate *L'Aube*, belonging to the squadron maintained by the French government in the Pacific, for the protection of its whalers and the promotion of national interests, arrived under Captain Lavaud; and on the 16th it was followed by the *Compte de Paris*. Captain Stanley explained to Captain Lavaud the state of affairs, who, on his part, declared that (as the whaler had to proceed to sea) the emigrants should be landed on an unoccupied part of the bay, where he pledged himself, not only that they would do nothing hostile to the British government, but that until fresh instructions should be received from the respective governments of England and France, they should merely build themselves houses for shelter, and clear away what little land they might require for gardens. Six long twenty-four pounders, mounted on field carriages, were on board the *Compte de Paris*, with the agricultural tools, which surprised Captain Lavaud, who positively forbade their being landed. Mr. Robinson remained as an English magistrate at Akaroa, engaged three or four Englishmen as constables, and accepted the French commander's offer of a cabin and seat at his table, so long as *L'Aube* remained at Akaroa.

The validity of the land-purchases of the Nanto-Bordelaise Company were subsequently investigated* by the Land Commissioners, and Governor Hobson was instructed to grant to the French similar terms to those conceded to British companies, namely, a right of selecting an acre of land for every crown (5s.) expended in sending out emigrants, &c., provided that the native titles to the land so selected should be equitably extinguished. The head chiefs, when questioned by Colonel Godfrey and Major Richmond, the commissioners appointed to enquire into the

* August, 1843.

† See Appendix to Select Committee on New Zealand, in 1844; p. 435.

‡ For instance, we find Mr. E. G. Wakefield, in vol. i., p. 4, of his *Adventure in New Zealand*, published in London in 1845 referring to the assumed

case, positively denied having sold any land to Captain Langlois in 1838, and no satisfactory testimony was adduced in proof of their having done so, but they admitted having made over to him their interest in certain parts of Banks' Peninsula, when he arrived there in August, 1840, in the *Compte de Paris*, for goods, &c., amounting in value to £284 sterling. Evidence was produced before the court that the engagements of the Nanto-Bordelaise Company to the emigrants sent out by them, had been fulfilled, and likewise that a considerable sum (according to their agent, M. de Belligny, £15,000,) had been expended on roads, bridges, and improvements, in consideration of which, 80,000 acres of land were granted to the company by the British government, although this contract with the Maori chiefs was, according to the strict letter of the law, null and void, having been made subsequently to the proclamation issued by Governor Gipps, in January, 1840, forbidding the acquirement of lands from the natives of New Zealand after that date.

M. de Belligny declared before the commissioners that the French ministry had given "a promise of protection" to the emigrants.† How this vague statement, of which no kind of proof or corroboration was given, could be so construed as to convey the idea of an intention on the part of France to found a "penal settlement" in New Zealand, it is difficult to conjecture. Most assuredly the circumstances above narrated do not afford any sufficient evidence of a project having been entertained so directly in violation of the law and custom observed by civilized nations; yet the New Zealand Company persisted in reiterating this assertion, sometimes on grounds which would have been manifestly absurd, but for the profound ignorance of the public on the facts of the case;‡ taking to themselves the whole merit of having preserved New Zealand to the Crown of England, although well aware that British colonization, and christian civilization, had taken root in the land long before their formation into an associated body. They must, moreover, have been cognizant of the train of circumstances which led to the assumption of direct purchase made by Baron de Thierry at Cambridge, in 1820 (see p. 130), in the following manner:—"This circumstance deserves notice as having laid the foundation of the attempt made by the French government, in 1840, to establish a penal settlement in the Middle Island."

sovereignty in behalf of her Majesty over these islands, totally irrespective of the mission of Colonel Wakefield, at the close of 1839, on a land-jobbing, or to use the words of the directors, an "exclusively commercial" speculation.

GENERAL HISTORY OF NEW ZEALAND RESUMED.—The subsequent history of New Zealand consists chiefly of disputes, more or less fatal in their consequences respecting titles to land; of endeavours, on the part of the Crown to carry out a system in accordance with the principle advocated by the late Dr. Arnold, by which all lands not actually in cultivation were to be considered as vested in the sovereign; and of constant opposition on the part of the Maories, whose construction of the treaty of Waitangi, was considered just by many Europeans (including the three successive governors, the bishop, and chief justice), and who maintained that there were no "waste lands" in the whole territory of the three islands, inasmuch as every acre had its legitimate owner or owners, as the case might be, without whose special consent, no alienation could, according to native custom, take place. Throughout the whole period, a systematic hostility was maintained by the New Zealand Company, to the government (imperial and local), as well as to the natives, in the endeavour to "defend their rights to the valuable property of 20,000,000 square acres,"* and thus the seeds of intestine warfare were sown broad-cast over this unhappy country.

The policy pursued by England towards New Zealand, was shadowed forth in the instructions of the Marquess of Normanby to Captain Hobson, 14th of August, 1839, from which I have previously quoted. In them, it is impressed upon the future governor, that the aborigines—

"Must be carefully defended in the observance of their own customs, so far as these are compatible with the universal maxims of humanity and morals; but the savage practices of human sacrifices and of cannibalism must be promptly and decisively interdicted; such atrocities, under whatever plea of religion they may take place, are not to be tolerated within any part of the dominions of the British crown."†

Captain Hobson enquired how he was to repress "these diabolical acts" by force, after other measures had failed, and what

course was he to adopt to restrain the no less savage native wars, or to protect tribes who are oppressed, &c.? His previous knowledge had taught him, that at least for a few years, until the new comers and the aborigines had amalgamated, and until the peaceful and civilizing influences of the Christian missionaries had time to produce their full fruits, a repressive, if not over-awing, military establishment would be indispensable; and he called the attention of the secretary of state to the following omission in his instructions:—

"No allusion has been made to a military force, nor has any instruction (been) issued for the arming and equipping of militia. The presence of a few soldiers would check any disposition to revolt, and would enable me to forbid, in a firmer tone, those inhuman practices I have been ordered to restrain. The absence of such support, on the other hand, will encourage the disaffected to resist my authority, and may be the means of entailing on us, eventually, difficulties that I am unwilling to contemplate."‡

The reply was to the effect, that if persuasion and kindness could not prevent cannibalism, human sacrifices, and warfare among the native tribes, these abhorrent acts were to be repressed by authority, and if necessary, by actual force, within any part of the Queen's dominions; but no troops were granted to Captain Hobson, who, on the contrary, was informed by Lord Normanby, that it was—

"Impossible, at the present time, to detach any of her Majesty's troops to New Zealand; nor" (his lordship added) "can I foresee any definite period at which it will be practicable to supply that deficiency. It will probably, therefore, be necessary to raise a militia, or to embody an armed police."

At this period, the probability of collision between the English and the Maories was not contemplated by her Majesty's government, who were far from foreseeing the necessity of maintaining a military force in New Zealand, and (as we have seen) had urgently impressed upon Captain Hobson their desire of governing solely by moral influence. The unhappy conflicts occasioned by disputes respecting land, rendered this most desirable object quite impracticable; and, so early as February, 1840, we find Lieutenant-governor Hobson assuring the Marquis of Normanby, that the—

"Conflicting claims for land that will be brought under the consideration of the commissioners who are to be appointed to investigate them, will create a violent ferment through every class of society, both native and European."

* *Vide* Second Report of New Zealand. (15th Sept., 1840.)

† Parliamentary Papers, 8th April, 1840; p. 40.

‡ Letter to Lord Normanby, dated London, August, 1839. Parliamentary Papers on New Zealand, page 44.

He adds—

"I know perfectly well, the former will resist the execution of all awards that may be unfavourable to them, and that it will require a strong executive, supported by military force, to carry such decisions into effect."

Owing to the dispersed state of the British population, and the number of points to be guarded, the lieutenant-governor was of opinion that not less than four companies of a regiment, the frequent visits of ships of war, and the assistance of police and militia, would be "sufficient to maintain the dignity of the Crown, and secure the due execution of the laws."*

In May, 1840, a detachment of eighty men arrived from New South Wales; but this soon proved to be a very inadequate force; and in June, 1840, the lieutenant-governor, when informing the governor of New South Wales of a disturbance that had taken place, describes it as illustrating—

"The very frail terms by which peace is maintained with the native population; a mere drunken brawl might have involved us in a war with half the country. The inference to be drawn (he adds) is, that an augmentation of the military force is absolutely necessary: it must never be overlooked, that the native population are a warlike race, well armed, and ever ready to use these arms on the slightest provocation."

Lord John Russell, in a despatch of December, 1840, admitted the justice of these remonstrances, but declared himself unable to hold out any expectation of an increased number of troops, at least for the present.

It now becomes necessary to note the preliminary steps taken for the arrangement of claims to land acquired before the date of the treaty of Waitangi. In August, 1840, the Governor and Council of New South Wales, within whose jurisdiction New Zealand had been placed, passed an act under which Commissioners were appointed to inquire strictly into all the circumstances under which land was said to have been purchased by British subjects from New Zealanders. By a provision in this act, 2,560 acres (the maximum grant which the governor of New South Wales was empowered to make prior to the introduction of the system of Australian land-sales, in 1831,) was fixed upon as the largest quantity that any individual could retain, in virtue of cession from the natives. In whom the surplusage of acres (beyond the amount fixed) of any

territory acquired from the natives vested, was not stated, but it was supposed to become the property of the Crown. Legal titles could only be issued by the representative of the Crown, to obtain which it would be necessary to prove that a reasonable consideration had been given to the native proprietors.

The rate of sufficient payments was fixed as follows:—between the years 1815 and 1824, at sixpence per acre; 1825 to 1829, six to eightpence per acre; 1830 to 1834, eightpence to one shilling per acre; 1835 to 1836, one to two shillings per acre; 1837 to 1838, two to four shillings per acre; and in the year 1839, four to eight shillings per acre. During the discussion on this subject in the Legislative Council of New South Wales, a circumstance occurred which, though trifling in itself, appears to have had no inconsiderable share in exciting among the natives a distrustful feeling towards the government. A New Zealander was introduced into the gallery of the council chamber, and there heard Sir George Gipps speak of his countrymen as "poor savages, whom it would be the very height of hypocrisy in her Majesty's government to abstain, or pretend to abstain, for religion's sake, from despoiling of their lands, and yet allow them to be despoiled by individuals being subjects of her Majesty."† His excellency likewise denied the right of the Maories as "independent savages," to dispose of their lands in the manner described by Mr. Wentworth, with reference to his assumed purchase of 20,000,000 acres at the rate of one farthing for every 100 acres; and asserted that of the crown (in virtue of its newly-proclaimed sovereignty,) over the unoccupied lands. The Maori returned to New Zealand, and spread far and wide, statements which, we learn from Mr. Busby, "created the greatest excitement and indignation." A deputation of Christian natives waited on their pastor (Mr. Davis), and asked if it were indeed true, that the British government intended to take possession of their lands? and whether several shiploads of emigrants might be expected? To the first inquiry Mr. Davis replied that he believed there was no such intention. To the second, he could not but answer in the affirmative; upon which they significantly inquired, "What, then, is to become of us?" Mr.

* Parliamentary Papers on New Zealand, 11th May, 1841: p. 12, 13.

† See Parliamentary Papers on New Zealand, 11th May, 1841; p. 78, &c.

Davis endeavoured to quiet their fears, by assuring them they would be protected in their properties; but with many of them this assurance was ineffectual, and he was told in very plain terms, that if they were betrayed, the missionaries and the Resident had been their betrayers, and should be the first objects of their vengeance.

Mr. Busby says:—

"That the sentiment was universal amongst the natives in the Bay of Islands, that if the Queen (according to the enactments of the Land Claims Bill) deprived her own children of their land (which they had bought from the natives), it was only because she was not yet strong enough that she did not interfere with theirs. It, therefore, need excite no surprise that they should consider themselves over-reached and betrayed, when that right of pre-emption which they were prevailed upon to yield to the Queen for the benevolent purpose of protecting them from the fraudulent dealings of her subjects, was made the very instrument of realizing their worst fears."

Lord John Russell entertained a different opinion, and from his despatch to Governor Hobson, in December, 1840, (which has been already quoted, p. 144,) it appears that his lordship did not look upon the whole territorial surface of the islands of New Zealand, as vested in the aborigines; but only such lands as they occupied, used, or enjoyed.† His lordship deemed it absolutely necessary that a commissioner should ascertain, and that the law should determine, what lands were private and what *public* property,‡ and that the "demesne of the crown should be clearly separated from the lands of private persons, and from those still retained by the aborigines." The crown lands (when ascertained) were to be surveyed as promptly and accurately as possible, then opened for settlement, and disposed of by public sale at a uniform price. After defraying the expense of the survey, not more than fifty per cent. of the net sale proceeds of each year were to be appropriated to the exigencies of the public service, and for the benefit of the aborigines; the remaining fifty per cent. to be expended in the conveyance of emi-

grants from the United Kingdom to New Zealand. Lord John Russell further determined that,—

"All lands held by private persons, and not actually in cultivation should be subjected to an annual tax, the non-payment of which should be followed by the confiscation and seizure of the land, on the grounds that until this were done there could be no reasonable prospect of the colony making any effectual advance in agriculture, wealth, or sound internal polity."

The injunctions respecting the immediate subdivision of the surveyed lands, and their accurate mapping, were peremptory; but it would have been very difficult to have carried them fully into effect; if, however, a complete running survey, however rough, had been made immediately after the assumption of sovereignty by Great Britain, many of the disputes which subsequently arose from conflicting land claims, might have been more satisfactorily adjusted.

In a despatch dated the 28th of January, 1841, Lord John Russell again urges on Governor Hobson, that—

"The lands of the aborigines should be defined with all practicable and necessary precision, on the general maps and surveys of the colony," and desires that "tracts of land permanently retained for the use and occupation of the aborigines should be defined by natural and indelible land marks, and should be inalienable even in favour of the local government."

A sum not amounting to less than fifteen or more than twenty per cent. of the purchase-money of all lands bought from the aborigines, was to be expended in "promoting the health, civilization, education, and spiritual care of the natives," on the recommendation of the Protector appointed by the Crown to watch over and superintend their affairs.

From the preceding statements, some notion may be formed of the difficulties which beset Governor Hobson from the commencement of his administration, which were greatly aggravated by the contumacious tone assumed towards him by the Wellington settlers, who criticised and cavilled at his measures, in a similar style to that adopted by the New Zealand

rights of chiefs, were well established native institutions." [*British Colonization of New Zealand*, pp. 53, 54.] The natives had no idea whatever of the terms "public" and "private" property; they ceded sovereign power to the Queen magisterially, and in agreeing to grant a right of "pre-emption" to the crown, they supposed that they would thus at all times have a purchaser for the waste lands, or such territories as they might be disposed to alienate. It is necessary to keep this point in mind, as it affords a clue to many subsequent difficulties.

* Parliamentary Papers on New Zealand, 1845; p. 15.

† A shrewd and logical writer has, however, taken a different view of the bearing of this despatch.—*Vide New Zealand Question, and the Rights of the Aborigines*: by Louis Alexis Chamerodow, Secretary to the Aborigines' Society: p. 221, *et sequitur*.

‡ The *New Zealand Association* of 1837 made a marked distinction between "property in land," and "sovereignty as respects government," and acknowledged that "property in land, and the sovereign

Company towards the home government, whom the directors openly accused of being actuated in their proceedings by "*a malicious motive*," a desire to injure the Company, and punish them for their alleged misconduct.* The settlers, however, had soon reason to perceive that they were far more likely to receive protection and assistance from the representatives of the Crown, than from the Company, for (despite the promise given them) but few months after their departure from England, another settlement was planned, whose members, like those of Wellington, were doomed to struggle through long years of suspense, before receiving the "allotments," for which (under any circumstances,) they had given a most exorbitant price.† The following are the chief facts connected with the origin of the

NEW PLYMOUTH SETTLEMENT.—In the month of February, 1840, an association was formed in the west of England, termed the "New Plymouth Company," avowedly in connexion with the New Zealand Company in London, of whom the former was to purchase land, for the purpose of reselling it to capitalists, or leasing it to farmers who might be disposed to emigrate, and found a settlement to be termed the "Plymouth Colony of New Zealand." The directors of the branch Company invested the money of their shareholders by purchasing £10,000 of the stock of the London Company, at par, for which they were to receive a territory comprising 50,000 acres, clear of all streets, public places, roads, and native reserves. The land was to be specially selected by the surveyor of the Plymouth Company from such part of the Company's possessions as might hold out the best prospects for the commercial and general prosperity of the settlement. The town of New Plymouth, by the original plan, was to consist of 550 acres, *exclusive of all streets and public places*; to be divided into 2,200 town sections of a quarter of an acre, which were to be sold at £10 each; 200 sections to be reserved for gratuitous distribution among the native families dwell-

ling near the settlement. A belt of land round the town, containing 10,450 acres, exclusive of roads, was to be divided into 209 *suburban* sections of fifty acres each, nineteen of which were likewise to be reserved for the natives. The land outside this suburban belt was to comprise 57,500 acres, to be divided into rural sections of fifty acres each, and leased or sold.

Applicants for twenty-one years' lease, of one or more of the 50 acre rural sections, were to deposit a sum of money in London, to be returned to them in the colony, for investment in fencing and farming the land so leased; the rent of which was to be 3s. per acre for the first seven years; 4s. for the next seven years, and 6s. for the residue of the term. The Company were to advance money at the rate of ten per cent. interest to the lessee, on the security of the stock; and during the currency of this lease, he was to be at liberty to purchase the freehold of his farm, at the price of £3 per acre during the first seven years, and £5 per acre during the remainder of the term.‡

Before the land was selected in New Zealand for the new township, and on the strength of the assumed *twenty million acre* purchases of Colonel Wakefield, the allotments were put up for sale in England. The following is an illustration of the mode in which the sales were managed. At the drawing of the *lottery* for priority of selection of the New Plymouth suburban sections of fifty acres each, the secretary and managing-director drew the first lot, and the next thirty fell by chance (?) in the following manner; eighteen to the Company; one to the "native reserves;" two to directors; one to auditor; two to Company's agent; one to colonial surgeon, and two to friends of the directors.

Thus, in fact, until the thirty-one best selections were made, the *public* purchasers were not, under this pretended lottery, permitted a choice. The number of allotments were, in all, 209; of these, 113 were drawn for the Company, probably to be resold as in other cases at an advanced price.

* See Mr. Gibbon Wakefield's Evidence before Select Committee, July, 1840, p. 17.

† Governor Grey, in a despatch dated New Plymouth, 2nd March, 1847, when referring to the still unsettled state of the alleged land purchases of the New Zealand Company from the natives, says—"I found the settlers in a state of great distress; many of them who had brought large capitals with them from England, have now expended the whole of their money, waiting in the vain expectation that they

would at last be permitted to occupy their land, and living from year to year upon that capital which was intended to render their land productive, and which, having been now all wasted, will render their land comparatively valueless, when it is obtained for them."—Parliamentary Papers on New Zealand, Dec. 1847; p. 3.

‡ The Company afterwards refused to carry out these arrangements, which caused much disappointment.

In August, 1840, Mr. F. A. Carrington, a gentleman, whose maps and labours, while engaged in the Ordnance department (England), had established his character as a surveyor, was sent out to fix the site of New Plymouth. He examined the entire coast-line of the country between Capes Farewell and Campbell, (including the tract where the Nelson Settlement was afterwards placed,) but considered it unsuitable from the barren character of the land, and finally selected a portion of the district about Taranaki (Mount Egmont,) and the Waitera, on the west and south-west part of the Northern Island, as best adapted for an agricultural settlement. His choice was approved by Colonel Wakefield, who alleged that he had bought the whole district in October, 1839.

That the reader may understand the leading cause of the difficulties and disagreements which took place between the natives and the settlers, occasioning to both parties, especially the latter, severe and prolonged distress, it becomes necessary to explain, as clearly as may be, the peculiar circumstances under which the assumed purchase was made. Some five years before the arrival of the agent of the New Zealand Company, a powerful tribe, termed "Waikato," under their chief, Te Whero-where, conquered the aborigines of the Taranaki district (the Ngatiawa tribe) and expelled them from their rightful territory. Those who were taken prisoners were carried away as captives; some fled towards the country bordering either side of Cook's Straits; others took refuge in the mountains of Cape Egmont, or on the Sugar-loaf islands off the coast. It was from some of these latter that Colonel Wakefield professed to have bought the land in question,* in the manner thus described by a well-informed, and always truthful writer,†—

"Messrs. Wakefield and Dorset went in a vessel to the roadstead, and landed an illiterate whaling master (R. Barrett), who had a mere smattering of the native language, to negotiate the purchase of the whole adjoining district. With about forty men, women, and children an arrangement was made, and goods were given to them in exchange for the whole district—as the Company's agents said—but in exchange for those natives' lands, or parts of them only, in the nearest district alone—as the natives understood. The interpreter was incapable of explaining correctly what the natives meant."

Thus the New Zealand Company—

"Endeavoured to buy a tract of land from a few

* Parliamentary Papers, 12th Aug. 1842; p. 188.

† Remarks on New Zealand, pp. 29—31.

persons who owned about a thirtieth part of it, the great majority of the proprietors being then absent;" (they were, in fact, kept as prisoners of war by the Waikato tribe, who some years afterwards, at the instance of Christian missionaries, granted the captives permission to return to their own land, which, to their surprise and displeasure, they found occupied by Europeans.)

Such is Captain Fitz-Roy's view of this transaction;—Mr. Carrington's evidence before the House of Commons' committee, in 1844, places it in a far more unfavourable light, and leads to the conclusion that Colonel Wakefield's proceedings were dictated by a spirit of expediency (falsely so called), rather than honesty. For instance, Mr. Carrington produced a letter received by Richard Barrett from Colonel Wakefield, and dated "East Bay, Queen Charlotte's Sound, November 8th, 1839," from which the following paragraphs are quoted as sufficiently showing the object of the writer,—

"Sir,—I have to inform you that *I have purchased* for the New Zealand Company, from the chiefs of the Kafia and Ngatiawa tribes, *the whole of their possessions, rights and claims, on both sides of Cook's Straits*, between the thirty-eighth and forty-third degrees of south latitude, *an ample consideration having been paid for the same*. All the chiefs, including those of the small tribes, forming part of the Ngatiawas, having executed deeds of conveyance to the Company, and fully understanding that they are not to resell any portion of land or timber within those boundaries. I beg that you will make the sale known to European settlers in the Sound and its neighbourhood, in order that they may avoid the useless trouble and expense, and the collision with the Company, which will be caused by their making any purchases in these districts from *this day's date*. (Signed,) W. WAKEFIELD."

At this time, according to Mr. Carrington, "*no proceedings had been taken towards the purchase which is stated in that letter to have been completed*;"—and this assertion is, to a great extent, confirmed by the fact that *nineteen days after* the date of the letter in question; namely, on the 28th of November, we find it stated in Colonel Wakefield's journal, that he landed Richard Barrett at Taranaki on that day, with instructions—

"To assemble the numerous chiefs resident on a coast line of 150 miles, in a month's time, when I am to return to make the payment for the different districts, and receive the written assent of the chiefs to the sale; * * * I have every hope that on my return here, the *completion of the bargain* (between the many conflicting interests and divisions of the occupants) will be effected."†

A further corroboration of Mr. Car-

† Vide Appendix to the twelfth Report of the New Zealand Company, p. 131, F.

rington's assertion is, that in the *Adventure in New Zealand*, by E. J. Wakefield (vol. i., pp. 180—183), the nominal purchase of a considerable portion of this very district, is stated to have been made on the 15th of February, 1840. These and other circumstances (the opinion of Captain Fitz-Roy, Mr. Clarke, and others), seem to justify Mr. Carrington in declaring that "the report of Colonel Wakefield as to the purchase was not only false, as regards the time of the negotiation, but also false as regards the extent of territory acquired."*

In February, 1841, the surveys were commenced, notwithstanding the opposition of the natives, who, putting their arms round the trees, declared that they should not be cut down, neither should stakes be driven into their land; they performed their war dance naked, as is their custom when proceeding to conflict; and on several occasions brought their tomahawks hard down on the head of Mr. Carrington, with repeated threats, but he so far prevailed by patience and good humour, as to be suffered to proceed with the survey, on the faith of his promise, that their land should be paid for when the white people came to settle on it.

In the following month the first detachment of emigrants, called the *pioneer expedition* (144 in number) arrived at Taranaki, or, as we must now call it, *New Plymouth*, and were joined by the main body of settlers on the 3rd of September, 1841. Lots for the order of choice for *rural lands* were then drawn; but notwithstanding the much-vaunted promise of "a tenth" of their land being in every case reserved for

the natives, as some compensation for the almost nominal price† for which they were supposed to have sold the entire territory; no such reservation appears to have been intended in this instance, as (according to the testimony of the surveyor of the settlement,) no lots were drawn on their behalf. Another selection of rural lands was made in June, 1842; but again no sections were set aside for the natives, notwithstanding the remonstrances of Mr. Carrington, who urged upon the representatives of the Company, the agents, and the (so-called) landowners, that unless some spots were left for them (the natives) on the rivers Waitera and Waiongona, the settlers would not be suffered to occupy their allotments. The justice of this unheeded warning was evidenced when too late, by the fact, that many of those to whom it was addressed, never received the lands, which though not rightfully purchased, they had, nevertheless, dearly paid for; while others were obliged to resign their original selections on the before-named rivers, and take, instead, any they could procure within the block around the town; which itself was so disproportionately large, that "the building allotments" were frequently converted into arable land.

Meanwhile, the New Zealand Company having pursued, from the first, a course of illegal and unjustifiable proceedings, as well as of lavish and wasteful expenditure of money entrusted to them by individuals for a special purpose, found it necessary to alter for a time the contumelious and defiant tone‡ they had hitherto maintained

* *Vide* Letter to Viscount Howick, 1844.

† Mr. Wakefield alleged before the Parliamentary Committee of 1840, that the native reserves constituted the principal value of the sale made by the aborigines, and gave in an estimate of the value of 110 reserves, comprising 10,100 acres out of 110,000, in the Wellington district. By this estimate, one was worth £1,000; four averaged £800 each; four, £600; three, £500; three, £400; five, £300; thirteen, £250; five, £200; three, £180; three, £150; three, £140; seven, £130, and the remainder were stated at different lesser values; in all, amounting to £33,390. This witness added, "the lots drawn for the natives happened to be very good ones, and the consequence is, that the sections reserved for them have already acquired a very high value."

The evidence of Mr. Campbell, the government surveyor, is in direct contradiction to this assertion. He states that, with few exceptions, the native reserves (at Port Nicholson) have been selected in spots so distant from the *pahs*, and where the ground is so hilly as to render them almost useless to the natives for the purposes of cultivation."

Mr. Commissioner Spain quotes the above paragraph, in a report addressed to the local government of New Zealand, and declares that he "fully coincides in his (Mr. Campbell's) opinion.—Appendix to Report of Select Committee of 1844, p. 294.

Another authority on this subject corroborates Mr. Campbell's account, by describing some of the "native reserves" at Wellington, as having been adroitly marked down among the native *pahs*, which had never been alienated, or in spots already inhabited by, and belonging to resident natives, to which the New Zealand Company had not a shadow of right; and the majority of the "reserves" were so "partially" selected, as to render them unfit for cultivation, and ineligible for leasing." The total inadequacy of these much vaunted reserves for the subsistence, or for the amelioration of the moral or physical condition of the Maories, is sufficiently evidenced in the fact, that up to 1843, the trustees of the native reserves were unable to raise sufficient means to procure medical comforts for the sick.—Letter from the Protector of the Aborigines, 26th October, 1843.

‡ Mr. W. Hutt M.P., a director of the New

towards her Majesty's government, and direct all their efforts to the obtainment of a charter of incorporation, which should not only limit the liability of the shareholders to the amount of the capital respectively subscribed by them, but should also protect them from actions at common law, which might be brought against each proprietor by those who had paid money for land which they had never received, and had, in fact, been deprived of their property under false pretences. The urgency of the case would neither admit of delay in time, nor of hesitation as to the expenditure of money for the desired object. The support of several members of the legislature was procured; the services of some (in their legal capacity,) were obtained by retaining fees and other means available to a public Company, influential from the station of its directors (very few of whom, however, appear to have been really conversant with its affairs, or to have taken any active share in their management,) and rich so long as the public should continue credulous. Among other measures, the press, or at least a portion of it, was actively employed.

An arrangement was at length effected, one inducement to which, on the part of the government, was unquestionably a desire to enable the Company to relieve the Wellington settlers from the distressing position into which they had been inveigled.

On the 18th November, 1840, a statement of the terms on which a royal charter of incorporation would be granted, was transmitted to the New Zealand Company, by order of Lord John Russell, who, *pre-mising*, on the faith of the assurances given by the Company, that *an equitable purchase of several million acres of land had actually been made, of which the Maori titles were completely extinguished*, proposed, that an estimate should be made of the money disbursed by them for the purchase of land, the conveyance of emigrants, for surveys,

Zealand Company, and a member of the select committee of the House of Commons appointed in 1840 to enquire into the affairs of New Zealand, in reply to a question (No. 1,065,) addressed to him by the Chairman, on the 24th of July, stated that "the Company is disposed to question the proceedings of the government." He then read a series of hostile resolutions passed by the Directors of the New Zealand Company, on that morning, wherein the proclamation in the name of the crown respecting land (p. 140), issued on the assumption of British sovereignty, was declared an "unparalleled interference with private rights;" and a mode of procedure "so contrary to international law, and so

road-making, the erection of public buildings, and other incidental expenses. When the outlay of the Company should have been ascertained, a grant of land was to be made them from the crown, in the ratio of one acre for every five shillings reasonably expended by them for the above-named purposes. It was expressly stated, that the lands to be assigned to the Company were to—

"Be taken by them in that part of the colony of New Zealand at which their settlement has been formed, and to which they have laid claim, in virtue of contracts made by them with the natives or others, antecedently to the arrival of Captain Hobson, as her Majesty's lieutenant-governor at New Zealand," and should "comprise all tracts to which any persons have derived titles through them (the Company), provided that such tracts be situated at or in the neighbourhood of Port Nicholson, or at or in the neighbourhood of New Plymouth, and also provided that such tracts shall not collectively amount to more than 160,000 acres, and provided further, that no such tracts shall be such as, regard being had to the general interests of the colonists at large, ought to be reserved and appropriated for any purposes of public utility, convenience, or recreation. With the exception of the before-mentioned tracts, the land to be selected by the Company as aforesaid, shall be taken by them in one or more blocks. Of such blocks, any number not exceeding six, may be of the size of not less than 5,000 acres each, and the rest of a size of not less than 30,000 acres each. Every such block to be, as nearly as possible, a solid parallelogram, bounded by the natural land-marks of the country."

The Company, on their part, were—

"to forego and disclaim all title, or pretence of title to any lands purchased or acquired by them in New Zealand, other than the lands so to be granted to them as aforesaid."

Of the other terms upon which her Majesty's government proposed to grant a charter to the New Zealand Company, the following clauses are necessary to be borne in mind, as materially affecting the interests of a large portion of the British and Maori population of the Wellington and New Plymouth settlements:—

"The Company having sold, or contracted to sell, lands to various persons, her Majesty's government disclaim all liability for making good any such sales

utterly repugnant to justice, as to require that this Company should employ every legitimate means of resistance to the enactments of government taking effect." Another resolution intimated that measures would probably be adopted to prevent the Maori chiefs "on the Company's territory" from acknowledging the sovereignty of the Queen of England. According to a statement made by Mr. Williams (Church missionary) to Captain Hobson, by whom he was sent to Port Nicholson, to obtain signatures to the treaty of Waitangi; the attempt was made, and Mr. Williams was "not able to obtain the signatures required at Wellington, owing to the opposition of Colonel Wakefield and others to the treaty."

or contract; it being nevertheless understood that the Company will, from the lands to be granted to them as aforesaid, fulfil and carry into effect all such their sales and contracts. It being also understood that the Company had entered into engagements for the reservation of certain lands, for the benefit of the natives, it is agreed, that, in respect of all the lands so to be granted to them as aforesaid, reservations of such lands shall be made for the benefit of the natives by her Majesty's government, in fulfilment of, and according to the tenor of such stipulations."

With regard to the incorporation of the Company, it was proposed that the charter should be granted for the term of forty years, but should contain provisions for its resumption by the Crown, and for the "purchase of the lands and other property of the Company, on just and equitable terms, if the public interest (meanwhile) should require such a resumption and purchase."

From the foregoing abstract of the proposed arrangement, it must be evident that Lord John Russell's offer was simply that of granting to the Company a charter of incorporation on certain conditions, and of legalizing, by titles from the Crown, the claims of the Company to a portion of the land to which they, on their showing, were presumed to have *fairly and fully* extinguished the native title.

Considering their previous unjustifiable proceedings, these terms were more favourable than any they could reasonably have anticipated; and, in the reply of the governor (Mr. Somes), on the following day, (19th November, 1840), the above propositions are described as framed on "liberal and judicious principles," and declared to be such as the Company had "no hesitation in accepting."

In acknowledging this acceptance of his offer, Lord John Russell (through Mr. Vernon Smith) apprized the Company of the intention of government to apply to all other British subjects the same rule to which they (the Company) would be subjected in respect to their land claims, viz.—that all claimants should, after due investigation by a special commission, have the titles to land granted them "by the chiefs of those islands, according to the custom of the country, and in return for some adequate consideration," confirmed by the Crown, in the ratio of one acre for every five shillings invested. "This

advantage, however," it is added, "will be offered only to those whose lands were acquired before the 5th January, 1840, the date of the proclamation issued by Sir G. Gipps on the subject.*

The charter was granted on the 12th of February, 1841. By its provisions the subscribed capital of the Company, was fixed at £300,000 in shares of £25 each, of which two-thirds were to be paid up within twelve months; with power to increase it to £1,000,000, and also to borrow on mortgage to the extent of £500,000†.

No lands could in future be purchased by the Company from natives, but on any purchase from her Majesty's government to the extent of 50,000 acres, paid for in ready money, ten per cent was to be remitted as discount,‡ together with an allowance for surveys. All crown lands in New Zealand in future to be sold at 20s. per acre. The clause to limit the duration of the charter to forty years, and to give the Crown within that period a power of resumption, and the right of purchasing the lands and other property of the Company, was objected to, and not inserted in the charter.

Mr. Heale, in commenting upon this charter, declares, not without some reason, that it contains "no troublesome clauses to bind the Company—no restrictions as to the price at which they were to sell,—no fixed portion of the proceeds allotted to emigration, not a shadow of control reserved to the government."‡

Mr. James Pennington, an accountant, to whom a statement of the disbursements made by the New Zealand Company was submitted, gave it as his opinion that the expenditure of the Company on which its right to receive land might be immediately admitted, was £60,000 + £101,560 = £161,560; but considered that a decision with regard to the further sum of £87,696, likewise asserted to have been expended in the manner stipulated, was a subject for future inquiry and consideration. By the result of this investigation, the Company became immediately entitled to receive (*out of their purchases from the natives in 1839*) a crown title to 646,240 acres, and in the event of the latter sum being found to have been duly invested, to

* Parliamentary Papers, New Zealand, 11th May, 1841, pp. 85—96.

† The rate of discount was afterwards changed, at the solicitation of the Company, to twenty per cent. for the first two years from the date of the agree-

ment, and fifteen per cent. at the expiration of that period.—Parliamentary Papers, New Zealand, 1841.

‡ *New Zealand, and the New Zealand Company.* London: 1842; Preface, p. 7.

an additional extent of 350,784 acres. The grounds on which Mr. Pennington founded an award so favourable to the Company, (provided the native title to even a very limited portion of their twenty million acres *should have been extinguished*) are by no means satisfactorily stated. Lord John, in proposing the arrangement, had expressly stipulated that an estimate of the outlay of the Company, under distinct heads, should be made, in which estimate "no item shall be admitted which shall not be found to have been just and moderate in amount, and fairly demanded by the exigencies of the service to be performed."* It is much to be regretted that this stipulation was not rigidly enforced, and still more, that a clear exposition of the affairs of the Company had not been made a preliminary condition to the grant of the charter; for a due regard to the interests of the public demanded that before important concessions were made by the minister of the Crown on their behalf, it should have been distinctly understood what services the Company had rendered, or were likely to render, to entitle them to such consideration, and especially, whether their dealings with the public had been characterised by good faith and discretion. To this end it should have been shewn how much of their own capital the Company had invested, — what they had actually paid the natives, and how much they had expended of the money placed in their hands by various persons, *in trust*, for the purchase of land, and other specific purposes, and in what manner. An account should likewise have been given of the sums which had been paid to different individuals for rights and privileges, real or assumed;† of the payments, salaries, and expenses (reported to have been most unreasonable), which had been allowed to the promoters and agents of the Company, both in London and the colony; what moneys had been paid, and under what contracts, to Mr. Somes (the governor),‡ and others. On

* Parliamentary Papers, New Zealand, November, 1840.

† The large sum of £45,000 appears to have been paid to a few members of the New Zealand Company of 1839-40, for the pretended rights and privileges of the inchoate New Zealand Company of 1825, and the New Zealand Association of 1837, whose members had repeatedly declared, that their efforts were purely patriotic, and had no connection with joint-stock speculations. By a remarkable coincidence, however, the same names are prominent in the proceedings of 1825, of 1837, and of 1839-40.

‡ The *Times* of 28th January, 1851, alludes to the

all these points the government had unquestionably a right to demand, and record for the benefit of the public, full information; in place of which, we have a jumbled statement of £161,560, and £97,696 = £259,256 expended by the Company, who claimed in their own right a proportionate award of land without reference to the settlers, to whom by far the greater part of the money rightfully belonged, having been entrusted by them to the directors, upon certain conditions, most of which remain to the present moment unfulfilled. Between the Company and its land-purchasers, *the government*, it should be remembered, could have no right to interfere, and in enabling the Company to fulfil their promises, (provided their repeated assertions respecting the equity of their extensive territorial purchases should prove correct), her Majesty's ministers had really done more than could have been expected, under all the circumstances of the case. We find even the deluded Wellington settlers eventually acknowledging this, and ascribing to the unjust and ill-advised proceedings of those in whom they had placed implicit confidence, the sole blame for their failure.

The Company had received from them (in all), £128,040, of this large sum £25 per cent, or £32,010 was to be retained for the profit, and to meet the expenses of the management: the remaining £75 per cent = £96,030 was to be held *in trust* by the Company, and to be appropriated towards emigration, and for the benefit of the land-purchasers, who aver, that although the Company, "as trustees, had no right to derive any profit from such expenditure;" yet that on account of having disbursed this £96,030 trust-money, the Company obtained from the Crown "384,120 acres, of which they allotted to them (the Wellington settlers) only 127,790 acres, and appropriated the other 256,330 acres to their own use and benefit," in addition to 128,040 "enormous difference" in the rates paid by the New Zealand Company, from the years 1839 to 1844, inclusive, for the conveyance of emigrants, compared with those paid by her Majesty's government for a series of years, and by the Canterbury Association in 1850. It is to be hoped that parliament will direct a searching investigation to be made into the manner in which the New Zealand Company have expended nearly one million of money, of which a large portion has been contributed from the taxes levied on the people of England. In every quarter, the question is put—"What has become of the money?"

acres awarded them on account of the 25 per cent = £32,010, retained according to the agreement for their profit and expenses.

In addressing the directors, the "purchasers of land in the first and principal settlement," state their case simply and forcibly :—

"If you lay claim to these 256,330 acres, what becomes of the stipulation that the Company shall only retain twenty-five per cent. for its own profit? If, for example, you receive from government 400,000 acres for the first £100,000 paid by purchasers, and only allot them 100,000 acres, keeping for yourselves the other 300,000 acres, do you not, instead of twenty-five per cent., reserve for the Company seventy-five per cent.? Is there not here a most gross breach of a most clear and explicit agreement?"

"We will suppose, however, for the sake of argument, that you were not clothed with the character of *trustees*, and that you never stipulated that you should retain for your own use *only* twenty-five per cent., still we must ask—have you any claims superior or equal to ours, to appropriate to yourselves all the advantages conferred by Lord John Russell's agreement? Can you show any peculiar merit which would entitle the Company to keep to itself the territories thus awarded? You cannot deny that the lands in question (256,330 acres) have been acquired *by means of the expenditure of funds which we furnished*. You cannot pretend to have incurred any personal risks. You have admitted, that whatever value the lands to which you have become entitled possess, is derived from our sacrifices. You can, in short, urge, in regard to these lands, no other merit than that of having expended our money; and for this you have been paid a commission fixed by yourselves—a commission which must be deemed most ample. For instance, you have received, for expending the first £75,000 paid by us, £25,000, which entitled you to 100,000 acres. You have, in fact, been awarded 100,000 acres of land, for the trouble of expending £75,000, received from the first purchasers. And yet you are not satisfied! but are *endeavouring to appropriate to your own use the lands acquired by our funds—purchased by our sufferings—we might almost say, by the blood of our fellow-settlers.*"*

On these and other grounds set forth, the settlers at Wellington tell the directors of the New Zealand Company,—“You trample upon the rights of all whom you believe to be too poor—too distant, and too unprotected to resist your injustice.”

It was not, however, until some years after the grant of the charter in 1841, that

* Memorial to the Directors of the New Zealand Company, from the land-purchasers at Port Nicholson; pp. 43, 44.

† The relative advantages or disadvantages of Auckland and Wellington for the capital of New Zealand, are fully and ably set forth in a letter to Lord Stanley, dated 20th September, 1841, (*vide* Parliamentary Papers on New Zealand, 1842, pp. 68—72) from Roy and Co., solicitors, London, on

the deluded “land-purchasers,” convinced that there was nothing to be gained by continuing to pursue, towards the directors, the conciliatory policy they had long maintained without advantage, poured upon them the full tide of their wrath. In the interim, they vented their complaints on the local authorities, uniting their efforts with those of the New Zealand Company in endeavouring to procure the removal of the seat of government from Auckland to Wellington,† it being rightly foreseen, that such a measure could alone prevent the latter from becoming (as it was for several years) a complete failure. To this end, not only were the most exaggerated descriptions of the advantages of the latter, and the disadvantages of the former, put forth in every possible way, but the colonial servants of the Crown, from the highest to the lowest, were stigmatized as “land-jobbers,” “grasping menials,” “incapable,” “tyrannical,” and “corrupt.” Governor Hobson came in for the largest share of vituperation, on account of the straightforward honesty with which he endeavoured to place before the home government the real facts of the case. The following extract from his despatch of 10th November, 1840, is important in many respects, and may serve as an illustration of the “plain-speaking” which rendered this good and public-spirited governor so thoroughly unpopular and “impracticable” in the eyes of those whose manœuvres he fearlessly exposed :—

“The industry with which the New Zealand Company have circulated throughout the United Kingdom, by means of the press, most exaggerated descriptions of the land at Port Nicholson, and very incorrect statements of the extent of country at their disposal, has had the effect of deluding the people of England into a belief that the nature of the soil, and the facilities for cultivation throughout that district, present advantages which are nowhere else to be found; that their title to the land is undisputed, and that the port is the finest in the colony; all which reports are, in my opinion, unsupported by fact.”

“The utmost quantity of land available for cultivation is 25,000 acres, and this is to be found in detached spots, and in situations difficult of approach, and all heavily timbered.”

“The title of the Company to the land they have

behalf of several settlers in Auckland, and persons possessing property in its neighbourhood, who are not named, but among whose number may be included an association called the Manukau Company, who, through their agent, Captain Symonds, laid claim to a considerable tract of country in the vicinity of Auckland, of which, however, only a small portion was eventually confirmed to them by the grant of a crown title.

resold is at least questionable: it is disputed by the natives, by the Church Missionary Society, who have bought extensive tracts of the land claimed by the Company, in trust for the natives, and by many British subjects, on the grounds of priority of purchase. The port is certainly most spacious, and is free from danger within its heads; but its very great extent, and the tremendous violence of the prevailing winds, generate so heavy a sea within itself, as to suspend, for many days together, all operations connected with the shipping.*

The justice of the opinions expressed by Governor Hobson, respecting the utter unfitness of Wellington for the capital of New Zealand, received full confirmation from his successor, Captain Fitz-Roy, who, on occasion of visiting Wellington, in 1844, declared that—

"Words could not express the surprise and disappointment with which Port Nicholson and the town of Wellington were seen for the first time. The port is too large to be sheltered, even from prevailing winds; and it has a long, narrow entrance from the open sea, between threatening and really dangerous rocks, making it almost a blind harbour. It is nearly surrounded by high hills covered with forests, and appears to have but little level, cultivable land in its immediate neighbourhood. The stormy climate, the straggling, exposed, and indefensible nature of the town, and the depressing prospect for the future in such a locality, during at least the present generation, might well cause sorrow that such a situation should have been chosen."

When it became evident that neither cajolery nor specious reasoning could tempt or mislead Captain Hobson into sacrificing the interests of the colony at large, to those of the Company and its settlers, a series of petty persecutions was commenced, sufficient to have harassed a far less sensitive mind, and worn out a far stronger frame, than those of the unfortunate governor. Public meetings were held at Port Nicholson, and resolutions adopted to petition her Majesty for his recall, on the ground of partizanship and neglect of public duty; the only specific charge against him, beside the great one of not deeming Port Nicholson a fit site for the capital, being, that he had "seduced" four pair of sawyers, four carpen-

* On the 19th April, 1841, Lord John Russell communicated the despatch of Governor Hobson on Port Nicholson to the directors of the New Zealand Company, "in order that they might inform the public" of the unfavourable view taken by him of the position and capabilities of Wellington. This suggestion, it is almost needless to say, was not adopted; the policy invariably pursued by the Company being, to let nothing meet the public eye calculated to impede their land sales. Even their own agents complain of the unfair use made of their reports, only such portions being put forward as served the immediate interests of the directors; the remainder, however important, being suppressed.

ters, two masons, and five labourers, required for the construction of public buildings at Auckland, to migrate thither from Wellington, where there was a redundancy of labour, and where the agent of the New Zealand Company ultimately obliged the unemployed, skilled, and unskilled labourers to become "squatters," in order to relieve the Company from the expense of their support.† But the pretext was a plausible one in the sight of the English public, who were ignorant that in consequence of the proceedings of the Company, the settlers, however enterprising, could employ but little labour, having spent the best part of their capital, without acquiring land upon which to employ the remainder.

This petition produced from the British colonists in the northern portion of the island one to an opposite effect, applauding the measures adopted by Captain Hobson, and praying her Majesty to retain his services. In commenting on these petitions, in a despatch dated 26th May, 1841, Captain Hobson says—

"It is quite evident, notwithstanding the extraneous matter introduced into the Port Nicholson petition, that the whole matter resolves itself into the simple fact, that I have not studied the exclusive advantage of the Company, by fixing the seat of government at Port Nicholson; and it is equally certain, that the counter-petition must be attributed to my having chosen my position on the Waitemata."

He adds—

"Had I been base enough to prefer my own comfort to what I believed to be the public benefit, I could have established myself at Port Nicholson, where, surrounded by a compact society, all personally identified with the place, I might have left it to the Company's agents, or their press, to answer any censure which might flow in upon me from other quarters. Or had I been still more base, and kept in view my pecuniary advantage, there could have been no scheme devised better calculated to ensure my own fortune and that of my friends, than presented itself at Port Nicholson; it needed but to have speculated largely in the Company's shares, and having raised their value by the location of government, to have sold off my interest whilst they preserved their artificial value.

Dr. Dieffenbach, in a letter to Governor Hobson, dated 17th February, 1841, states, that the New Zealand Company "*did not* faithfully report his researches, and only those parts which suited the purposes of the Company were published." (Parliamentary Papers on New Zealand, 12th August, 1842, p. 89.) Mr. Carrington, the head surveyor of New Plymouth, makes a similar complaint in his letter to Viscount Howick, and declares, specifically, that some of the statements put forth in the Company's fifth report, "were not true, and had cruelly deceived the public." (Page 89.)

† Parliamentary Papers on New Zealand, 12th August, 1842; pp. 29, 30, and 155.

"But, my lord, I claim no merit for resisting these temptations; for had I yielded to them, the moral debasement would have sunk me to the grave.

"In my public capacity, I came to this country without bias to any interest whatsoever; I judged from what I saw, and what I learned from authentic sources, from which I formed a strong conviction that this portion of the country united in itself the numerous qualities requisite for the seat of government of this promising colony; and I therefore chose this situation."

There are other portions of this despatch which shew that Captain Hobson, notwithstanding the vexatious and offensive opposition which the Port Nicholson settlers had maintained towards him, appreciated their energy; considered them "a valuable class of colonists;" was earnestly desirous "to disabuse their minds of the evil prepossessions instilled into them by the Company's agents and their press;" and was at that time anxiously deliberating on the steps most likely to obviate their difficulties. To this end he proposed, for the benefit of the settlers at Wellington, and other places at a distance from the seat of government at Auckland, the institution of general, quarter, and petty sessions of the peace, very nearly assimilating to those held in England: to bring home justice to settlers in remote (chiefly whaling) stations, a magistrate was to be appointed for the purpose of occasionally visiting such places, and holding petty sessions on the spot. To these measures was to be added the establishment of courts of requests, for the recovery of debts of small amount. The governor further declared that it would hereafter become necessary to hold circuit courts for the trial of capital offences and issues in civil actions; and proposed to grant to the settlers of Port Nicholson or of any other town where the inhabitants might be sufficiently numerous to carry out the details, and afford the expense of managing their own affairs, charters of incorporation; with power to elect their own civic officers, and confer on them the authority generally vested in English corporate bodies, so as to afford the colonists much local control, and relieve the government "from the enormous expense attendant on the establishment of new towns."*

This valuable despatch† likewise contains some excellent remarks on the state of the

* These propositions received the approval of Lord Stanley on the 24th of January, 1842, and were afterwards embodied in Ordinances.

† Despatch of Governor Hobson to her Majesty's Secretary of State for the Colonies, 26th of May, 1841.

colony, calculated to convey a clear, and (according to the testimony of a very high authority on this matter),‡ a correct idea of the general condition of affairs in New Zealand at this period. Of these the most interesting are the following:—

"Those persons who have settled at Port Nicholson under the auspices of the Company are, from their rank, their numbers, and their wealth, by far the most important in the colony. But it is to be regretted that, from the impunity with which they have heretofore, in defiance of the government, encroached on the land, they assume a tone of dictation and authority, which is totally subversive of all government, and which must eventually be overcome, or the sole management of the affairs of the island must be surrendered into their hands.

"On a recent occasion Sir George Gipps gave them the permissive occupation of 110,000 acres around Port Nicholson, on condition of their confining themselves to that limit, with a promise to recommend to your lordship to obtain for them from her Majesty a free grant to that extent, in return for the expense the Company had incurred in importing immigrants to the colony. But almost coincident with that act of grace, they spread themselves over the lands of Wanganui, to a distance of ninety miles, in direct opposition to a notice simultaneously published both by Sir George Gipps and myself, respectively.

"To this encroachment they have since added the lands of Terranake (Taranaki), which they have assigned to the Plymouth Company; and there is great reason to apprehend that none of this vast territory has been legally purchased from the aborigines. But this is a question I will not prejudice.

"I design shortly to visit Port Nicholson, when I will require the agents of the Company to submit their claims for examination to the land commissioners.

"The natives in the neighbourhood of these new settlements have evinced considerable dissatisfaction at the occupation of lands, to which they lay claim; and more than one tribe has called on me to remove the intruders, threatening to dislodge them by force, if I do not afford redress. I hope, when I visit them, to reconcile these differences, and if necessary, to require a further payment to be made to satisfy their claims.

"Besides the natives, there are many Europeans who claim large portions of these lands in virtue of prior purchases; but these latter will furnish cases for the land commissioners to decide."

To maintain anything approaching to chronological order in narrating the leading events in the history of New Zealand, it is necessary very frequently to change alike the immediate subject and scene of action. We must now return to the proceedings of the directors of the New Zealand Company. The money received by them for land in the Taranaki district (New Plymouth),

‡ Captain Fitz-Roy, in his *Remarks on New Zealand*, says, "his (Governor Hobson's) representations of the real state of the country, true to the letter, were slighted, and his opinions, now proved sound were bitterly assailed."—(p. 14).

being soon swallowed up by their expensive establishments at home, abroad, and their various disbursements (including a dividend to the shareholders of ten per cent.), they resorted to their old expedient for procuring a fresh supply, by the formation of another settlement. The following narrative of the most important circumstances connected with the establishment of Nelson was drawn up by Mr. Tuckett,* who received the appointment of chief surveyor to the new settlement, and was sent out in charge of one of the vessels of the pioneer expedition. That he proved fully equal to his position is attested by the unqualified approval of his proceedings pronounced by the directors. Mr. T. C. Harington, the secretary of the Company, in forwarding to Colonel Wakefield the copy of a resolution passed by the committee of management, and confirmed by the court of directors, says,—

"The attention of the Directors has been drawn to the numerous occasions on which the agent at Nelson has found occasion to bring under notice the very zealous and satisfactory manner in which Mr. Frederick Tuckett, the chief surveyor under his orders, has performed his duties, and the unusual

* While engaged in collecting materials for the present volume, I sought to obtain information from men of character and standing, who had been actors in, or eye-witnesses of the transactions in New Zealand, which I desired truthfully to record. Among others, I sought to benefit by the experience of Mr. Tuckett, because in his public capacity he had acquired the reputation of having strenuously endeavoured to fulfil his arduous duties, not only to the New Zealand Company, but also to the land purchasers, whose future prospects were necessarily so dependent on the judgment, zeal, and integrity of the individual to whom the important task was confided of selecting the site of the future settlement. Much stress was laid by the directors on the undoubted qualifications of Mr. Tuckett, at the time of his appointment, as affording an additional ground of confidence on the part of the land purchasers, with whom his interests were purposely identified by his remuneration being made to consist chiefly of land in the Nelson settlement. Unable to reconcile these facts with the grievous and glaring error committed with regard to the ineligible site eventually chosen, I applied to Mr. Tuckett, who thereupon informed me of the circumstances attendant upon the establishment of Nelson, adding, that he availed himself gladly of every opportunity of declaring to the public, that he could and would have fulfilled his duty to the land purchasers, by the selection of a site suitable for a prosperous settlement, had he been allowed to do so by the New Zealand Company, there being no impediments on the part of the aborigines, or the government, which would have prevented the accomplishment of this object. Mr. Tuckett's statements coincided so closely with those I had already recorded concerning Wellington and New Plymouth, and, together with his evidence and opinions concerning the character and conduct of the natives, appeared

rapidly with which, by means of his exertions, considerable portions of land have been rendered available to the Company, and purchasers enabled to obtain possession of their allotments; the Court of Directors therefore expressed their marked approbation of that gentleman's conduct, and of the zeal, ability, and judgment with which he has performed the duties entrusted to him." (June, 1843.)

"NELSON.—Doubtless encouraged by the credulity of the public, and the eagerness with which the lands already offered for sale to constitute the settlements of Wellington and New Plymouth, had been purchased, without waiting to ascertain whether the seller had really possessed that which was offered for sale, or whether, if possessed, it was desirable for occupation, the New Zealand Company, late in 1840, brought before the public the scheme of a new sale of lands, by which it proposed to form a third, and a greater and more inviting settlement than either of the former; this third settlement to be called Nelson.† Professedly in order that it should be more advantageous to the future proprietary, as well as to all the members of this new settlement, the price of the land was appointed to be thirty shillings per acre, in lieu of twenty,‡ the New Zealand Company undertaking that proportionately greater advantages should be realized, by its expenditure of the money committed to its trust by the confiding purchasers. For it will be readily understood, that the sum of £300 was not paid by the purchaser merely for an allotment of 201 acres of suitable land: on the con-

to me, to form so valuable and interesting a narrative, that I have been induced to insert it in the form in which it was communicated to me, with few and trifling alterations; believing that the graphic and truthful view it contains of several important matters in the history of New Zealand, will abundantly atone for any minor defects in style, attendant upon a sketch not originally intended for publication.—R. M. M.

† By the terms of the prospectus issued by the Company in London, on the 15th of February, 1841, 201,000 acres of land were offered for sale, divided into 1,000 allotments of 201 acres each, which were to comprise three sections, viz.:—"150 acres of rural land, 50 acres of 'accommodation land,' in the immediate proximity of the town, and one town acre." The town was to comprise 1,000 acres, exclusive of reserves for streets, squares, churches, cemeteries, markets, and public gardens or parks. The price of each allotment of 201 acres was fixed at £300. Priority of choice for the three descriptions of sections was to be determined by three several lotteries in London. Of the £300,000 purchase-money, £150,000 was to be appropriated to the exclusive purpose of emigration to this particular settlement; £50,000 to defray the expenses of the Company in selecting the site and establishing the settlement; £50,000 to public purposes, including £15,000 towards a college, £15,000 for religious uses and endowments, and £20,000 for the "encouragement of steam navigation, by way of bounty;" the remaining £50,000 was to go to the Company, "for its expenses, and profit on the use of its capital." A quantity of land equal to "one-tenth" of the 201,000 acres was to be reserved for the natives, "so that the quantity of land to be appropriated will, in fact, consist of 221,100 acres, and the town of 1,100 acres."—Parliamentary Papers of 11th May, 1841, p. 135.

trary, the land was to constitute but a small portion of the value which the proprietor was entitled to receive from the New Zealand Company. And here it is necessary to observe one very important clause in the covenant, namely, that *the best remaining site in New Zealand should be carefully selected* for the new settlement. * * * A circumstance which greatly conduced, in its effect, to the prejudice of the Nelson settlement, and which, of itself alone, was sufficient to prevent the New Zealand Company from acquiring and delivering the quantity of land which it had presumed to offer, and to receive the purchase-money for, was the inflexible persistence of its agents in refusing to purchase of the true proprietors, *the resident natives*, what was required for the settlement. They, the agents, were willing, it appears, to make presents to the resident natives everywhere, on taking possession, and, in some instances, even to an amount of value exceeding that at which these resident natives would have sold them the land, but only on condition, that in accepting these presents, they, the natives, should acknowledge that these lands had been previously sold to the Company's principal agent, Colonel W. Wakefield. It is conjectured, either that this procedure had its motive in some latent view of the sense in which might be understood the letter of the award which the New Zealand Company had obtained from Mr. Pennington, acting on behalf of the government, or else that, planting the settlement of Nelson on the shores of Blind Bay, without the concurrence of the governor, Captain Hobson, they thought to do so with greater security, if they could show that they could there obtain lands which had been purchased for the New Zealand Company before the British government had assumed the sovereignty, or appointed a governor. Whatever may have been the real motive, their conduct, in this respect, as well as in long persisting to disallow the authority of the land commissioner to investigate their claims to land, was almost the sole cause of all the opposition subsequently manifested by the natives, and of the consequent inability of the New Zealand Company to acquire or deliver to the purchasers, or their agents, the lands for which it had received their money. And these points of obstruction have another and even stronger claim on the consideration of the reader; for if overlooked, it might be readily imagined that the natives were insatiable and unfaithful, and thus great injustice would be done to them; whereas, if understood at the outset, and borne in mind, it will, in the sequel of the events which are to be recorded, be evident that the natives were an example to the colonists in self-respect and a love of honour and integrity. It will be seen, that whilst a very few fighting chiefs could be tempted to sell and to resell as often as a purchaser should offer a fresh consideration, however trifling, the greater part of the three islands, or any extent, small or great, as each fresh land-shark might desire, yet that the true proprietor, the resident native, in almost every case, and in every case if he had embraced the profession of Christianity, was eminently faithful to his engagement, however little he had received, and could not be tempted to accept a much greater gain, if on the condition of being unfaithful to his engagement, or a party to a lie. Another great impediment to success which the policy of the New Zealand Company created, arose out of its entire neglect and disregard of a numerous class of adventurous settlers, chiefly British, who had braved many dangers, before Chris-

tianity had shed its powerful and benign influence on the inhabitants of New Zealand, and prepared them for civilization. Many of these had formed connections with the natives; the daughters of influential chiefs were the mothers of their children; they had much influence with the natives; and not a few of them merited the influence to which they had attained. Domestic animals had been introduced and reared by them; horticulture, and, to some extent, agriculture was pursued by them: they had taught the natives to construct better residences, and to use boats; and their women to wash and bake, and to sew—improving them until they had become more helpful and companionable. They would have cordially welcomed the colonists, and used their influence with the natives to facilitate the colonization of the islands, if their prior rights and interests, and those of their children and the mothers had had just and fair consideration. But these were utterly disregarded, not only by the New Zealand Company, but by the government. And this injustice to this class of adventurous men, the first colonists, has been, and is yet, an ever active cause of distrust and opposition.

"In addition to the continuous series of errors to which may be attributed the inability of the New Zealand Company to fulfil its engagements, is the exceeding folly of its arrangements—so unwise, that it presents a great demand on the credulity of the most unsuspecting mind, to believe that the New Zealand Company ever really cared for the success of its settlements. Imagine a town to be founded at once in a new country by a handful of emigrants, in extent not less than two and three square miles; that the allotment of land must be purchased as a whole, though it comprised three sections, or three estates; that the actual and valuable colonist must not only wait until the whole town was surveyed and distributed, though he should have no want of a town lot, but that he had to wait until land could be found sufficient to afford the entire number of sections required in the whole scheme of the settlement, before he might select or obtain one; because the order of choice was not in the order of purchase, or of arrival in the colony, but was determined in the most injurious, not to say illegal and immoral method, by making a lottery of the whole. Can it be reasonably believed that the New Zealand Company was actuated rather by patriotism and philanthropy, than by the hope of gain by land-dealing, in which it might doubtless have well succeeded, had it not, in each successive step, by unparalleled and systematic indirectness of procedure, frustrated its own interests, as well as those of all who entrusted to it theirs. Of the latter, the most numerous and the most flagrantly deceived, were those of the labouring class, whom it induced to emigrate. For whilst it urged one class of its victims to purchase land at a high price, on its assurance that the cheapness of labour in the colony would make it profitable as an investment or for occupation, at the very same time, it gave each labouring man who emigrated an expectation of obtaining £2 per week wages, and promised to employ them itself at thirty shillings, should other and better employment not be offered them.

"The purchaser of land paid money on the assurance that the labourer would be prevented from becoming a cottier, and thus competing with his employer, or with the resident proprietor, in supplying the market with produce, and yet from the commencement the principal agent had made cottiers of

the labourers as rapidly as possible; and more, in Wellington and Nelson, their becoming cottiers was made the condition of receiving employment or other assistance. At the outset it had only this rational ground for hope of success; viz., the supposition that Australia could not grow grain to supply its own consumption, and that New Zealand afforded great facilities for growing it for consumption and for exportation.

"But when the settlement of Nelson was formed, the New Zealand Company knew that the facts were exactly the reverse, and that Australia would export to New Zealand; that the land of Australia was inexpensive to cultivate, and that the land in New Zealand which it claimed to have purchased was, for the most part, ruinously expensive to bring into cultivation; and yet the New Zealand Company continued to urge on the public the advantage to be derived from purchasing land of it. For the sake of human nature, we would fain hope that its career stands, and will ever remain unparalleled in its extreme of unmitigated folly and injustice. The only pleasure the reader can derive from perusing the narrative of the events of any of the settlements, is the evidence ever prominent, that the wicked has been overthrown by his own wickedness; but then there must be also uppermost the painful conviction, that this wickedness has involved hundreds, and thousands, if we embrace both the natives and the emigrants, in sufferings and crimes, for which no reparation has been made, and which no human tribunal could ever cancel.

"The preliminary expedition for the formation of the settlement of Nelson sailed from the Thames in April, 1841. It consisted of two vessels, the *Whitby* and the *Will Watch*, in which were embarked about eighty picked labourers, and the surveyors; the resident agent, Captain Wakefield,* in the *Whitby*, with half of the party; the chief surveyor (Mr. Tuckett) in the *Will Watch*, with the remainder. It being provided so that one party in either vessel should be sufficiently complete to be able, in the event of the loss of one of the ships, to carry into execution the instructions of the directors in regard to the preliminary steps preparatory to the arrival of the emigrants. These gentlemen, the resident agent and the chief surveyor, had each verbal and written instructions to the effect, that after their arrival at Wellington, they were to proceed to visit such localities as might be recommended to their attention by the principal agent, Colonel Wakefield, and that if none of these appeared to them to be good enough, that they should explore New Zealand further for a better, and the chief surveyor was specially instructed that should he arrive there first, and should the resident agent not arrive within a month later, he was to proceed with his party to execute the foregoing instructions. The labouring men who embarked in these ships were for the most part married men, but their wives and children did not accompany them. It was considered that the selection of a suitable site, and the preliminary labours necessary to prepare for the arrival of families, would be a work occupying a considerable time, on which account it was determined that the women and children should not embark until six months later, but the directors pledged themselves that the comfort and best interests of the wives and families should receive

their best attention, both in reference to their comfort, welfare at the depot, and subsequently on the voyage. With such assurances the party left their fatherland in good spirits, and after a favourable passage, both ships arrived at Wellington, New Zealand.

"It appears from the printed correspondence appended to the twelfth Report of the Directors of the New Zealand Company, that preparatory to the sailing of the preliminary expedition, the directors had solicited Lord John Russell, to instruct the governor to give them an extended field of selection, and had intimated that, on their part at least, there would be no objection to making this settlement of Nelson, or some future settlement identical with the seat of government. In making this request they acknowledged that they had not the power of unlimited selection, notwithstanding that in their addresses to the public, this was assumed without any qualification, they receiving the purchase-money for land in the settlement of Nelson, on the pledge of selecting the best remaining site.

"Lord J. Russell acceded to their request, giving some directions to the governor to extend their field of selection, but expressly prohibiting him from amalgamating the seat of government with any existing or future settlement of the New Zealand Company. Captain Hobson, with the best disposition to facilitate the wishes and enterprise of the New Zealand Company, met the preliminary expedition for the settlement of Nelson, on its arrival at Wellington; and on being applied to by the principal agent of the Company, to point out a district suitable for the proposed settlement, he invited the agents to examine three districts, either of which he engaged to put them in possession of, at Maoranghi, or on the Thames, or on the Waipa.

"But the agents of the Company refused to examine these, and specified Port Cooper, Banks' Peninsula, to be the site which they required for the new settlement.

"The governor refused his consent to the settlement being formed at Port Cooper, or anywhere in the Middle Isle. The agent utterly disregarding the covenant of selection of a site made by the New Zealand Company with those who purchased land in the future settlement of Nelson, then proposed to the governor an arrangement, by which the settlement of the Company should be confined to a territory on both sides of Cook's Straits, to which he proposed to have a valid title.† It was eventually determined to form the settlement on the shores of Blind Bay, and accordingly the preliminary expedition, leaving Port Nicholson, proceeded to Astrolabe roads, having embarked as guide or pilot, a Mr. Moore, who had already, with other settlers from Port Nicholson, visited the district, reported to their employers at Wellington, that it was suitable for the intended new settlement of Nelson, and had induced the resident natives to erect some large rude buildings at the entrance of a narrow valley, called the Rewaka, for the accommodation of the emigrants on their arrival. On quitting Port Nicholson, the *Whitby* and *Will Watch*, were compelled by the wind to approach near to the opposite shore of Cloudy Bay, and from each vessel was observed with no little surprise, the extensive plain of the Wairau, and the grassy hills to the east, since, of the probable eligi

* A brother of Colonel Wakefield, and of Mr. E. Gibbon Wakefield.

† Vide Colonel Wakefield's Letter, August 24th, 1841.

bility of this land for a settlement, with the contiguous harbour of Port Underwood, no rumour had transpired whilst the ships remained at Port Nicholson. Without examining either, they proceeded, beating through the straits, endeavouring to reach the island of Kapiti. The wind continued adverse, and increasing in strength after sun down, the *Will Watch* entered Queen Charlotte's Sound, and anchored in Ship's Cove. On weighing anchor next morning, desirous of learning whether there was any land on the shores of the sound, more available for occupation than the steep and stony-faced hills around these coves, the *Will Watch* stood up the sound as far as the north-west entrance of the narrow strait called the Tory Channel, and returning much disappointed at the aspect of the promised land, bore across the straits for Kapiti island, meeting the *Whitby*, at the appointed rendezvous. The object of calling at Kapiti was to acquaint the chief Rauperaha, that they were going to settle on the lands on the shores of Blind Bay, which he had sold to the principal agent. It does not appear that this chief offered any objection to the step, nor was it likely that he should, as he had pretended to sell that, which by native usage he had no authority to sell, and was probably almost the only party up to that time who had benefitted from the transaction. He listened to the intelligence respecting the great number of British, whose arrival at the settlement might be shortly expected, with a manner and expression in which something of alarm was scarcely concealed, but in which disbelief of the truth of the statement was clearly predominant. The principal chief of another tribe, E. Hiko, an inoffensive man, vain, and of weak mind, and who lived in much terror of his crafty and sanguinary neighbour, Rauperaha, was also visited and conciliated; as among the natives resident at Blind Bay, some were of Rauperaha's tribe, and others of E. Hiko's. Sailing from Kapiti, the ships proceeded to Astrolabe Roads, where having anchored, they were soon visited by the natives from the nearest pah, the *Motueka* and *Rewaka*, who seemed delighted at their arrival. A time having been appointed for a formal interview on shore, the agent, Captain Wakefield, informed them that on coming to take possession of the land which the principal agent, Colonel Wakefield, had already purchased, it was his intention to make them a very liberal present, in proof of the good-will of the colonists towards them; he explained to them the extensiveness of the contemplated plan, the numbers of British that might be expected to arrive to occupy the land, the quantity of land (one-tenth), that was to be reserved for them, (the natives,) and promised them that they should retain their present cultivations. Their reply was to the effect that they were well satisfied with his intentions and assurances, and welcomed the arrival of the British, provided he was disposed to purchase the land, but they indignantly declined to receive presents from him, on condition of acknowledging that the land had been already acquired by purchase. The conference broke up without any arrangement being made, each party being resolute as to the terms.

"Subsequently, by the exertions of Messrs. Moore, Heaphy, and the interpreter, and the threat of the departure of the expedition to favour another district, and the temptation of an augmented amount of presents, the majority of the influential natives reluctantly acceded to the condition imposed by the agent.

"Three parties of the surveyors proceeded to look for available land, and also for an available port, since there was no land in proximity to Astrolabe Roads. One of these parties, guided by Mr. Moore, landing at the buildings already alluded to as erected at the mouth of the *Rewaka*, proceeded up that valley, and retracing their steps, returned to the ships at Astrolabe Roads, and reported to the agent on the delightfulness of the country and the vast extent of excellent land which they had seen. Another party, conducted by Mr. Heaphy, landed at the same spot, and crossing the little plain near the mouth of the *Motueka*, followed inland the course of the narrow valley of that river to a distance from its mouth of about fourteen miles, and then retracing their steps, returned to Astrolabe Roads, where Mr. Heaphy reported to the agent that they had seen abundance of land for the requirements of the settlement of Nelson.

The third party consisted of the Chief Surveyor, one of his assistants, and a party of natives; passing by the *Rewaka* and *Motueka* rivers, he landed at the mouth of the *Moutere*, and then, directing his course first eastward, and then inland to the south, he examined a tract of country of about ten miles square, and returning after an absence of several days, also examined the plain of the *Motueka*, its valley, as far as there was any considerable breadth of available land, not extending more than seven miles from its mouth inland, and likewise all that was eligible of the narrow valley of the *Rewaka*. He reported to the agent, that *the quantity of prime land which they had seen did not exceed 4,000 acres; that of second-rate land he estimated the quantity at 8,000 to 10,000 acres; and that the rest of the country was utterly worthless for subdivision into sections:** and that, therefore, the settlement could not be formed on that side of Blind Bay. But he further informed the agent, that from a summit of a ridge of hills which he had gained, he had looked down upon a large plain, through which flowed a river called by the natives the *Waimea*, which discharged its waters into the sea at the south-eastern extremity of the bay, where much more available land could be obtained, should its quality be good, and where a port might possibly be found. The agent commented with much dissatisfaction on the discrepancy between this report and those of the two other exploring parties, and expressing his satisfaction with the other reports, assumed the responsibility of deciding on the sufficiency of the district examined, and directed the chief surveyor to make the necessary arrangements for the commencement of the survey of a site for the future town, from the little bay or cove of *Kaiteriteri*, extending along shore to the mouth of the *Rewaka* valley. The chief surveyor requested to be allowed to examine and report on the nature of the country on the shores of *Massacre Bay*; but this the agent would not permit. The survey of the town-site was commenced accordingly by the first assistant surveyor, Mr. Stephens; and the chief surveyor was then dispatched by the agent to explore the *Waimea*, the approved describer, Mr. Heaphy, being sent with him. At the same time, Mr. Moore, accompanied by an assistant surveyor and an able Deal boatman, was sent to the opposite and south-eastern shore of Blind Bay, to see if any port existed

* The italics throughout are mine, not Mr. Tuckett's.—R. M. M.

there. The latter, landing on a narrow boulder bank, found within it a tidal harbour, known to the natives as the *Wakatu*, but previously unvisited by Europeans, the entrance to which proved to be accessible at high-water to ships of 500 or 600 tons. Returning with this intelligence to Astrolabe Roads, they also informed the agent that there was much good land north of and around the haven of *Wakatu*. The chief surveyor and Mr. Heaphy were absent more than a week, occupied in exploring the plain of the Waimea, and further inland, its valley, and the hills intermediate between the valley of the Waimea and Motueka rivers, at a distance in a direct line from the coast of about twenty-six miles, penetrating into the interior beyond the limits of good land. The chief surveyor informed the agent that he judged there could be obtained on the course of the Waimea, as much as 60,000 acres of land available in point of level surface, which varied much in quality; but would afford a much greater quantity of good land than was to be obtained in the district of the Moterea, Motueka, and Rewaka.

Mr. Heaphy then, and afterwards, in England, reported to the effect that the quantity of available land on the Waimea far exceeded the requirements of the settlement, and that its quality was all that could be desired. In consequence of these united reports of the greater advantages of a location on the other side of Blind Bay, the survey of the site for the town at Kaiteriteri was stopped, the whole party re-embarked, and the ship sailed from Astrolabe Roads and entered safely the *Wakatu*, now called Nelson Haven. But still, with the unexpected advantage of this new district of the *Wakatu* and the Waimea, which was unknown at Wellington, and had, perhaps, never before been trodden by a European, the chief surveyor felt convinced that he could not obtain anywhere on the shores of Blind Bay (not less than ninety miles of coast), or in the interior, as far as the land was available, more than one-third of the quantity of land required to complete the scheme of the Nelson settlement. Therefore, although well satisfied with the port of *Wakatu*, and the land contiguous, merely as a site for a town, he yet felt that its extent demanded that it should be placed where access could be had to the requisite quantity of land; and therefore, when directed to quit and discharge the *Will Watch*, and commence the survey, he again protested against the procedure, and demanded of the agent that he should be permitted, in conformity with the instructions given to him in London, to explore New Zealand further for a better site.* But the agent insisted on planting the settlement in Blind Bay; the *Wakatu* was therefore chosen as the best site on its shores. The survey was commenced and carried forward with energy and rapidity—the surface being for the most part unwooded, only covered with a growth of fern, flax, or bulrush;—the assistance of extra surveyors, who worked by con-

tract, being obtained at the suggestion of the chief surveyor. By the first opportunity, Mr. Heaphy was dispatched to England with the intelligence of the location. Here it may be mentioned, that in London, associated with a Mr. Brady (who had been one of the early Wellington adventurers), Mr. Heaphy advertised *Soirées* for the purpose of enlightening the public on the advantages to be derived from purchasing land from the New Zealand Company; in much the same manner as is now being done, in order to induce persons to purchase land in the Canterbury Settlement.

"Within two or three months after the party of the preliminary expedition had landed at the *Wakatu*, three ships arrived with emigrants. One of these brought the wives and some of the children of the men of the preliminary expedition: but many of the children had died on the passage from gross neglect, and many of the women had led a dissolute life during the passage, the captain and his crew frequenting their apartments, and abandoning themselves to disgraceful disorder, to the great grief and discomfort of such of the women who acted virtuously. The conduct on board one of the other two ships which brought emigrant labourers, with their families, and also cabin passengers, was scarcely less immoral and disgraceful. The proportion of emigrant labourers to cabin passengers or proprietors, who might be expected to become employers, was even in the first two ships greatly in excess, although subsequently this pernicious disproportion became even greater and greater. Amongst the proprietors who arrived at an early period, was a Mr. Thompson, who had purchased three allotments of land, and obtained the appointment of police magistrate. Early in 1842, the principal agent arrived from Wellington, and spent a day or two at Nelson. He expressed dissatisfaction at the number of men then employed on public works, and paid by the resident agent; and also at the rate of wages they were receiving. He directed that the number and the rate of wages should be kept as low as possible, that they might be compelled to become cottiers. On this being objected to by the chief surveyor, as contrary to Mr. E. G. Wakefield's plan of colonization, which the New Zealand Company had adopted, and as a violation of the conditions on which the proprietors had purchased land, and the labourers had been engaged to emigrate, the principal agent observed, that his brother's plan was impracticable, that he had made cottiers of the labouring emigrants from the time of their first arrival at Wellington, and that the same course must be pursued with them at Nelson. Subsequently, the resident agent endeavoured to carry out these instructions; the number of men employed had alarmingly increased by every fresh arrival; they were all entitled to employment; and the rate of wages paid was only that which had been fixed in London by agreement. It was then reduced to nearly half. The men turned out, and, as a body, waited on Captain Wakefield, and protested against

* The disadvantage of the position selected for the settlement of Nelson, is fully set forth in the *Nelson Examiner*, in 1846. A detailed exposition is given of each district, and although the writer is desirous of taking as cheering a view as possible of the prospects of the settlement, he demonstrates how little land, suitable for the agriculturalist, is available within a distance of fifty to one hundred miles of the town of Nelson, with which regular communication

either by land or water, throughout the year is impracticable.

In the following table, the writer puts down the comparatively level land on Massacre and Blind Bay, at the Wairoa, &c., as 306,000 acres, of this he admits that 90,000 acres is a mere guess; it may be a true estimate or otherwise. The quantity of average land available for cultivation out of 306,000 is put down at 132,000, but of this more than one-half

the injustice of these proceedings. Finding that no discretionary power was vested in him, after some days spent in declamation and threatenings, they determined to resume work, at least nominally, and to accept the reduced wages; at the same time, they resolved *not to be cottiers*, to claim constant employment of the New Zealand Company, and to do as little work as possible. This course of action they steadily pursued for about fifteen months from that time, doing, on an average, not more in the week than they would have done in England, or by piece-work, in a day and a-half; and on every fresh arrival

is also guess work, and the other half is in many parts covered with trees, that would cost at least £20 an acre to clear, or consists of swampy or flooded land—which it would be equally expensive to clear. Some small spots of alluvial soil are in ravines and gullies—almost inaccessible.

Rough Survey of the "probable" amount of comparatively level land, within the supposed boundaries of the Nelson settlement:—

Localities.	Gross Amount of land, known or supposed to be level.	Estimated amount of fair average quality, or available for cultivation.
	Acres.	Acres.
Massacre Bay—		
Aorere ¹	115,000	10,000
Takaka and Motupipi ² . . .	30,000	15,000
Blind Bay—		
Motueka ³	10,000	5,000
Moutere Cliffs ⁴	15,000	—

Wairua Valley ¹¹	50,000*	
	306,000	132,000

The asterisk (*) indicates that the figures thus marked are rough estimates by the eye, or derived from vague information.

¹ Heavily timbered. ² A small part open land, the rest timbered. ³ Some hilly, open and timbered; much good soil, but very difficult of access. ⁴ One mass of barren clay hills, covered with stunted fern; a small portion of rather better land near the cliffs. ⁵ Low undulating clay hills. ⁶ A large portion of very broken ground, a tract well suited for pasturage, but much subjected to floods. ⁷ A series of narrow gorges; soil of medium quality. ⁸ Best portion consists of marshy ground; Waimea W., barren clay hills; Waimea Island, common sand hills. ⁹ Greater portion timbered, land said to be fertile. ¹⁰ Finely timbered. ¹¹ Prevailing character pastoral; portion most suited for agriculture lies within the lower half of the plain, some of it swampy and difficult of drainage.

of emigrants, they instigated the newly-arrived labourers not to accept employment from the resident proprietors under the rate of wages promised in London, at the New Zealand House, or by its agents in the country, and to importune the agent for employment, until he sent them to their predecessors, on the so-called public works. Great deterioration of character, and general demoralization and ill feeling was necessarily induced by this disgraceful bad faith, and unprofitable administration of the power and affairs of the infant settlement. As the surveys of the districts already named drew towards completion, it became manifest that the estimates of the chief surveyor of the settlement *had been erroneous; but only in this wise—that he had, in each instance, over-estimated the land, both in respect of quantity and of quality.*

"It was necessary to obtain lands somewhere else: for 200,000 or 220,000 acres, inclusive of the natives' reserves, were to be subdivided into sections; and the 1,000 or 1,100 sections of fifty acres, called suburban, though many were twenty and thirty miles distant from the town, had all to be found and surveyed, before selection or distribution of any could be had by the few and needy proprietors who had come out to be residents; and the 1,000 or 1,100 sections of 150 acres each, called rural, likewise must also all be obtained and surveyed before any could be chosen or delivered. The chief surveyor, having heard that there was good land, and also coal, in Massacre Bay, was pressing to examine that district, as being the nearest, and probably the best, from whence the natives were already in the practice of bringing their produce to the Nelson market. The agent was reluctant to have it annexed. It appeared that the principal agent opposed it. The Wellington interest probably thought it to be too good, on account of the coal, to become part of the Nelson settlement; and the agents well knew, that there at least it would appear, as declared by Governor Hobson, 'that the lands were claimed by other parties.'

"At length, finding that the survey could not otherwise proceed, the agent allowed the chief surveyor to proceed to Massacre Bay, and examine the district. Supplying him with goods, he directed him to treat with the natives, as had been done in the first instance, on their arrival at Astrolabe roads, with the natives of the Motueka, viz., to require them to acknowledge the land to have been already purchased by the principal agent, and to receive the goods as a present, in proof of the friendship of the colonists, on the occasion of their taking possession. Having procured a small schooner, and with a few labourers, in addition to the crew, to enable him to load her with coal and limestone, in the event of finding either or both accessible without much preliminary labour, Mr. Tuckett, accompanied by a Mr. Drummond, proceeded to Massacre Bay, and anchored near the principal pah. The natives gave him a friendly and cordial reception, but refused to receive the goods on the condition required, to which they knew that their neighbours, the natives of the Motueka, had submitted. The chiefs denied the statement that their land had been purchased by Colonel Wakefield: they stated, that they had sold to others, or to another, some of the land, and that they were willing to sell more, if the chief surveyor came to purchase. When informed that the land was claimed for the New Zealand Company, by virtue of its having been purchased by its principal agent of Rauperaha, they treated with much indignation and

contempt the pretensions of Rauperaha to sell *their* land, or any other land which did not belong to him.

"The natives, persisting in their determination not to accept the goods on the condition required, the chief surveyor informed them, that he would proceed to examine the lands on the Bay (a coast line of about fifty miles), and would return to them after a few days, and that, in his absence, he wished that the men whom he had brought with him for the purpose, should be occupied in boring the coal-seam, to ascertain its depth. The natives appeared not to object to its being done; but on his return to the schooner, after some days' absence, he found all hands on board, and learnt that the natives would not permit them to go to the coal, nor even to procure wood or water, unless they would purchase it. Proceeding immediately to the pah, he reproached the chief for his opposition to his wishes, and his inhospitality and meanness in desiring to sell wood and water; to which the other replied, that it was the custom of the white man at Sydney to sell water; and in respect to the coal or stone, that he would not allow it to be touched; but if the chief surveyor wished to purchase any, his people would get it, and bring it to the schooner. The chief surveyor then informed them, that as they refused the goods, they must go to Nelson, and treat with the Company's agent respecting their mutual claims; but that having come for the purpose, he should not return without loading the schooner, for which purpose he should proceed, with his boats, to the coal-bed, and obtain there the quantity that he required. The chiefs first threatened that they would meet him there, and prevent him from doing it; then they urged on him very strongly the consideration, that in doing as he proposed, he would be a thief; and lastly, they offered to get some for him, and to put it on board without payment, that he might have a specimen to take back with him on his return to Nelson. He endeavoured to explain to them, that it was not all good; that they did not know the good from the bad; that they had not the tools needful for working it; and lastly, that he was instructed to take possession of it as the property of his employers, and that on the morrow, he would take as much coal as he required, and stake the land, by way of marking possession. The chiefs repeated their threats of preventing him by force. The next day, as soon as the tide was favourable, and having first sent on shore to the chief to inform him that he was going for the coal, he left with the boats, and returned to the schooner with as much coal as the boats could carry, without having been interrupted, and without having seen any native. The interpreter, who had lived several years in New Zealand, and had much experience of the violence of the natives, as *heathens*, and in association with the European squatters and whalers, many of whom were also like heathens, expressing much alarm at his determination to take the coal, was left on board the schooner. When the lading was completed, (sufficient limestone had been previously obtained), a canoe came off from the pah, having on board the three chiefs, *unaccompanied*, two of whom came on board, the third remaining in the canoe. The principal chief, on looking at the coal, appeared to become almost convulsed with rage, and went through a most extraordinary pantomimic exhibition of passion, as an accompaniment to a vehement oration, frequently interrupted by jumping into the hold, and casting overboard large lumps of coal. One of the

European party was so alarmed by this very powerful acting, that he ran to the cabin, reappeared with a fowling-piece, and proposed to the chief surveyor to fire on the chief. He was immediately requested to keep himself and the gun in the cabin, and on no account to interfere. Fortunately, he complied forthwith; and though what passed did not interrupt the declamation and pantomime of the chief, the action of the man, and the instant reproof which he received, was all intelligently appreciated. When his passionate demonstration was brought to an end by exhaustion, the chief entreated that what had been taken might at least be paid for, that the surveyor might not have the disgrace of thieving. Next followed a somewhat similar performance, in two acts, from the other chief. They then remained still and silent for about ten minutes, when the principal chief walked forward, and with all the calmness of subdued grief, he offered his hand to the surveyor, and went down into his canoe, the other chief, after a short pause, very gravely doing the same. The third chief, who had remained in the canoe, stepped on board the boat, offered his hand with a look of kindness, and retired.

The relater of these incidents* is convinced that it was only because he did not bear arms for defence, and because he did bear and distribute to the natives the New Testament, that he and his companions, under Providence, owed their safety, and that they were enabled with success and impunity to make that aggression on the property or rights of these natives, because these natives had embraced Christianity, and therefore were most reluctant to do violence to any—much more to one who professed Christianity, and who having the book (the Bible), probably appeared to them to be some sort of missionary. The natives on the shores of Massacre Bay, at each village were found to be professed Christians, zealously observing the sabbath-day, and assembling daily to public prayers; and yet, at that time, they had not been visited by any European missionary. A few young natives after residing a while at the mission-station of Mr. Ironside, at Port Underwood, Cloudy Bay, having learnt to read and write; and accustomed themselves to the mode there observed of conducting divine worship, returned to their own people and became their instructors. On this journey the surveyor visited Wanganui, on the west coast, as well as those districts which discharged their waters into Massacre Bay. Returning to Nelson, arrangements were made for the survey of the available lands in Massacre Bay; and almost simultaneously, a company of picked labourers were associated as a coal company, and induced by the agent to undertake, with assistance, in the shape of rations and tools, the enterprise of commencing, simultaneously with the survey, to work the coal and to burn lime. The survey and the coal-working detachments, together, formed a party rather formidable in numbers. The agent accompanied them; and endeavoured to overcome the opposition of the natives, to induce them to accept presents, and acknowledge the land to be the property of the New Zealand Company; but all his efforts were vain. Some weeks, of course, elapsed before the men had constructed houses for their

* Viz., the chief surveyor, Mr. Tuckett, who shared the views entertained by the Society of Friends respecting the unlawfulness of war.—R. M. M.

shelter. Whilst thus occupied, the Christian natives were friendly and kind to them; but as soon as the former commenced directing their labour to raising and uncovering coal, the natives assembled and obstructed them, not by blows, but by re-covering the coal, and filling in their diggings with earth, and boughs, and stones, whenever they stopped work, at meal times, or during the night. The natives were careful that the European labourers should feel that they had no ill-will towards them personally, but only that they would not be robbed. Of course, the associated labourers, sent to Nelson frequent reports of the obstruction which they met with, and it was soon apparent that the enterprise must be abandoned, if the interference of the natives could not be prevented. The agent pressed the police magistrate, Mr. Thompson, to proceed to Massacre Bay, and arrest the chiefs, but he, for a while, firmly resisted such solicitations, on the ground of his responsibility to the government, as well as because the natives had done nothing illegal. At last came tidings, that one of the chiefs had broken in the heads of some casks which had been filled with lime to be shipped to Nelson, on which the agent required of the police magistrate to issue a warrant for the arrest of this chief, and to accompany him, and an armed party, to Massacre Bay. To this plan the magistrate reluctantly consented: it was carried into execution. The chief refused to present himself before the police magistrate, on which two men were ordered to carry him thither by force, which they did, under the protection of an armed party. The police magistrate required him to pay a fine for the offence, or to be taken to Nelson, and imprisoned there. The chief would not yield to pay a fine. Had an attempt to send him on board the ship as a prisoner been made, the natives would have probably attacked the colonists. Both parties were saved from a dilemma by the interference of the chief's wife, who procured the money, paid the fine, and liberated her husband. The police magistrate returned to Nelson, not a little gratified and elated at the safe and successful issue of an expedition in which he had engaged with much reluctance, and evident doubt of its wisdom or legality. Meanwhile the surveyors met with no interruption, the measuring of the land being a matter unimportant in the view of the natives, in comparison with the taking away of their coal and limestone; and very soon after the interference of the police magistrate, the cause of strife ceased, by the breaking up of the association of coal-workers, from the simple fact, that as the coal was not good enough for exportation, and too sulphurous for forge work, and as there was abundance of wood for home consumption; there was no demand for it, either out of the country or in it. Of the whole party three only remained, who chiefly occupied themselves in sawing timber and burning limestone. The natives had been undoubtedly somewhat intimidated by the armed interference of the police magistrate, which left them no alternative but to fight, or to be passive. They forbore from fighting, but firmly and patiently persisted in not renouncing their right, or that of other purchasers, to the land, by accepting goods as presents on that condition. They were subsequently further discouraged and weakened by the loss of two of their most influential chiefs, who, in the prime and vigour of life, were drowned in the heavy swell and surf not far from the shore and their home.

"The purchase of land was not effected until long

after these events. They refused in 1844, the sum of £290, proposed by the government land commissioner, and the affair was not concluded until 1846, when, through the aid of the government representative, and the Church and Wesleyan missionaries, they were at length prevailed with, to conclude with the resident agent a sale of the lands, Mr. Crawford probably not insisting on their protecting further, his prior claim. The whole of the available land on Massacre Bay, afforded less than half the number of the rural sections of 150 acres each, required to complete the scheme of the settlement, *all of which was to be obtained and surveyed before the distribution of any could take place.* The survey having been carried north-west to Cape Farewell, a distance of about seventy miles from the town and port of Nelson, and all that was interjacent and available, and much that was valueless having been laid out in sections, it became necessary to explore further, and in the opposite direction, for available land. Persevering, but fruitless efforts were made to find a feasible route to the south, in hope of annexing land on the plain on the east coast of the Middle Island. On one of these expeditions a tolerably easy route was found to the east, by which the valley of the Wairau was reached, and by descending the valley, the plain of the Wairau, on the shore of Cloudy Bay, opposite to Port Nicholson, and distant from Nelson, by water, about ninety miles, and by land 110. The chief surveyor, accompanied by an assistant, Mr. W. Davidson, and by a proprietor in the settlement, Captain England, having examined the Wairau Plain, and its facilities of communication with three tidal waters, viz., Port Underwood, the head of Queen Charlotte's Sound, and of the Pelorus, as also the overland route to the town of Nelson, reported it to be the *only available surface between Cape Farewell and Cape Campbell, the entire extent of the northern coast of the Middle Isle*, sufficient to afford the number of sections required to complete the settlement. The resident agent (Captain Wakefield), reluctantly determined on its being included in the survey of the settlement. There seemed to be, as in the former instance of Massacre Bay, opposition on the part of the principal agent (Colonel Wakefield), either from fear of the effect of its future occupation by, and annexation to another town and port, being prejudicial to the interests of the opposite town of Wellington, or from anticipation that the Company's claim to the Wairau would be resisted by other claimants and by the natives.

"Intelligence that the Wairau had been examined by the chief surveyor, and that it was intended to commence surveying it, soon reached the old heathen chief Rauperaha, on which, accompanied by two other chiefs, E. Hiko and Ranghiaiaia, he left the Northern Island, and crossing the straits, proceeded to the town of Nelson. The resident agent gave the chiefs an official interview in the house of a Dr. Wilson; and in the presence of many of the colonists, Rauperaha informed Captain Wakefield that having heard that persons had gone from Nelson to the Wairau, and that it was their intention to survey it, he had come to inform the agent that *they must not go there, as he had not sold the Wairau to the principal agent, and was not then disposed to do so; but if he should sell it, the payment must be considerable—"the cask of gold very great."* In reply to him, the resident agent claimed the Wairau as belonging to the Company; insisted on its having

been already purchased, and informed them that it must be surveyed. Ranghiaiaia denied the sale; refused to sell; and desired the interpreter to tell the agent that if he went there he would meet him and take his head. Captain Wakefield calmly replied that if Ranghiaiaia interfered with, or interrupted the survey, he would take with him 300 constables, and arrest him (make a tie of him.) Ranghiaiaia then, and daily whilst he remained at Nelson, continued to threaten each one whom he regarded as a leader of the colonists with death, in case they proceeded to the Wairau, unless they could kill him; in that case his conqueror should be welcome to the disputed territory. Rauperaha fawned, and begged daily for presents, declared Ranghiaiaia to be a bad fellow, and mocked the violence and vehemence of his utterance; entreated the surveyors not to persist in going to the Wairau, but said there should be no violence done them even if they did. He requested the agent to refer the claim to the decision of the government commissioner; but *the agent refused to recognise the commissioner's jurisdiction, in the claims of the New Zealand Company.* Rauperaha, on his departure with his companions, informed the agent that he should immediately request the Queen's land commissioner to examine the claim, and decide between them. The chiefs of the natives resident at Port Underwood, who occupied land there, had vast numbers of pigs in the Wairau, and frequented it for the purpose of procuring these animals for sale; and, at the proper seasons, for eels, ducks, pigeons, &c., for their own food. They had, under the instructions of Mr. Ironside, a Wesleyan missionary, embraced Christianity subsequent to their conquest of the former proprietors and inhabitants of the Wairau, and parts adjacent. The three principal chiefs were brothers, and they were the sons of an elder brother of Rauperaha. The eldest of the three, named Puaha, was much esteemed by Mr. Ironside and by his own people, and was a sincere and exemplary Christian, habitually exercising great self-control, and evincing much true refinement: his brothers were Christians only in name; could be gentle and courteous as long as they were pleased, or very much otherwise if anything thwarted them; one of these two was the Charley mentioned by the principal agent in his account of his purchases of land, and afterwards very active in the Wairau conflict. The chief surveyor had become acquainted with them at their pahe; had been received by them in a friendly manner; informed by them that the Wairau was theirs; that they had never sold it, and that Rauperaha could have had no right to sell it. They had manifested pleasure at its being approved of, and desired by the surveyor, at the same time they evidently wanted to defer any negotiation about it, until they had extended their cultivations there, and consequently increased their claim for compensation in disposing of this district.

"No sooner had Rauperaha and the other heathen chiefs of the Northern Isle quitted Nelson, than these latter arrived. They feared that Rauperaha had received payment for the Wairau, or that he had negotiated for it; and accordingly, their object in coming was to deny his right, and to assert their own. The resident agent (Captain Wakefield) had always been disposed to act justly and liberally towards the resident natives, as far as the restriction of not purchasing, but only of making presents, imposed on him by his employers would permit, and in this instance, all his sympathy

was on the side of the pretensions and claims of Puaha. Before giving him an official interview he was desirous that Puaha's acquiescence with the terms he could not depart from, should be secured. Puaha was offered a schooner for himself, for which he was known to have a strong desire, and any reasonable amount of goods that he might specify, and of which he should have the distribution amongst the people whom he considered to be, with himself, the joint owners of the Wairau, *provided he would acknowledge the purchase to have been made by the principal agent; which he firmly refused to do.* The following day the resident agent received him and his brothers, and asserted the Company's right to the Wairau, by virtue of two purchases, one made by a Captain Blenkinsop, repurchased of his widow by Colonel Wakefield; and the second a direct purchase made of Rauperaha by Colonel Wakefield, and enumerated, amongst different districts within certain degrees of latitude.

"Puaha denied the authenticity of both the alleged sales, and explained that the Wairau did not appear in the original deeds, but *had been inserted, on an erasure, or by interlineation,* and also that if Rauperaha had sold it, the act was invalid, as it could not be purchased without his consent, which he had never given. The agent repeated his former assertions and claim, and Puaha his counter statement; and this was renewed for three successive days, at each interview, on which occasions, Puaha never for a moment lost his temper, and won the admiration and respect of the agent and all who had an opportunity of observing him. Neither party would yield, and the three brothers left Nelson to return to Port Underwood, protesting, but without using any threats, against the intention of the agent to have the Wairau surveyed."

The relation of the fatal consequence of persisting in this unwise determination, must be postponed until the events which took place in other parts of New Zealand simultaneously with the early establishment of Nelson, have been detailed. These were all more or less connected with the "land question," which, owing to the proceedings of Colonel Wakefield, was becoming extremely complicated. The natives, as British subjects, urgently appealed to the local government to maintain their rights, and protect them from the encroachments of the settlers. Thus as early as August, 1840, Lieutenant Shortland when dispatched to Wellington by Governor Hobson, to put a stop to the "provisional government" established there, found the place in so disturbed a state from disputes respecting lands claimed by the New Zealand Company, by settlers unconnected with the Company, and by the natives, that he found it necessary to issue a proclamation warning all persons on their allegiance to their sovereign from assembling under arms without being duly authorised so to do. Lieutenant Shortland states that the natives behaved

exceedingly well; and that although on arriving at the piece of land in dispute (*one of their inhabited paha or villages*) he found it full of armed Europeans, yet the natives were quiet and unarmed.*

In this instance, and in several others, the mediation of the local government was successfully employed in effecting a compromise between the natives and the settlers, and might, without doubt, have been exerted to a far greater and more beneficial extent, had not every such endeavour been thwarted and misrepresented, in accordance with the mischievous and crooked policy pursued by Colonel Wakefield, who, there is great reason to believe constantly "aimed at keeping up a continual agitation against Captain Hobson, in order to withdraw the settlers from the real cause of their misfortunes,"† viz., the inexcusable proceedings of the Company, and of himself as their agent. To this end the local newspapers were made the only channel of communication between the governor and the discontented settlers of Port Nicholson and New Plymouth, whose grievances were fostered by the New Zealand Company, and used as arguments for the recal of the governor. Every effort was made to prejudice the natives against him, and likewise against their old and stanch friends the missionaries, who, Mr. E. J. Wakefield informed them were "only shoemakers or tailors, who received money from people in England to preach the Gospel to them,"‡ but that the *rangatira* or "chief" missionaries might soon be expected.

On 9th June, 1841, an ordinance was passed by the Legislative Council at Auckland to repeal the land act passed on behalf of New Zealand by the government and council of New South Wales in September, 1840, and to terminate any commission issued under the authority of the said act. New Zealand having since been made independent of New South Wales, the new ordinance enacted that—

"All unappropriated lands within the colony of New Zealand, subject however to the rightful and necessary occupation and use thereof, by the aboriginal inhabitants of the said colony, are and remain Crown or domain lands of her Majesty, her heirs and successors, and that the sole and absolute right of pre-emption from the said aboriginal inhabitants, vests in, and can only be exercised by her Majesty, her heirs and successors."

* Parliamentary Papers, New Zealand.

† See Appendix to Report from Select Committee, 1844, p. 278.

‡ *Adventure in New Zealand*, vol. i., p. 173.

All titles to land however obtained, "either mediately or immediately from chiefs or individuals of the aboriginal tribes," unless allowed by the Crown, were declared absolutely null and void.

Under another clause the governor was empowered to appoint commissioners to hear, examine, and report on claims to grants of land in virtue of titles acquired from the natives, such claims to be made at latest within twelve months from the date of the ordinance. The said commissioners to be—

"Guided by the real justice and good conscience of the case, without regard to legal forms and solemnities;" no grant of land to be recommended by them "which shall exceed in extent 2,560 acres, unless specially authorized thereto, by the governor, with the advice of the Executive Council, or which shall comprehend any headland, promontory, bay, or island that may hereafter be required for any purpose of defence, or for the site of any town or village reserve, or for any other purpose of public utility; nor of any land situate on the sea-shore within 100 feet of high-water mark."

Persons claiming to have bought or acquired territory in the positions above referred to, were to receive an equivalent or compensation in land not so situated. The commissioners were to be authorized to summon witnesses, and to punish by fine or imprisonment those who should fail to appear or refuse to give evidence.§ The rate of purchase|| between the years 1815 and 1839 was to be the same as that fixed by the New South Wales Act of September, 1840 (see p. 167), but fifty per cent. was added above these rates for persons not personally resident in New Zealand, or not having a resident agent on the spot. Goods when given to the natives in barter for land were to be estimated at three times their selling price in Sydney at the time. A scale of fees to be paid by land claimants was scheduled with the ordinance, and Captain Richmond and Colonel Godfrey, who had been previously selected by Sir George Gipps, governor of New South Wales; were reappointed land commissioners by Captain Hobson.

Up to the 1st August, 1841, about 600 claims had been referred by the governor to the commissioners for hearing, some of which had regard to small patches of ground, others to millions of acres; the rights of different parties being in many

§ Parliamentary Papers, New Zealand, 1843, p. 122.

|| See Schedule (B.) annexed to Ordinance.

instances asserted to the same tracts of land.

About this time intelligence reached the colony of the arrangement entered into by the home government, whereupon Colonel Wakefield addressed the following letter to the governor, which is given verbatim, as clearly evidencing the premises on which alone the New Zealand Company, by their own showing, expected, in common with all other purchasers, to receive a crown title to a certain portion of the territory over which the native titles had been extinguished:—

“Port Nicholson,, August 24, 1841.

“SIR,—On behalf of the New Zealand Company, with a view to carry out the arrangement entered into in November last, by her Majesty's secretary of state for the colonies, and the Company, and to effect the settlement of the Company's possessions in Cook's Straits, by the purchasers of land from them; upon the faith of that arrangement, I have the honour to submit to your excellency's consideration the following observations and proposals:—

“It is presumed in the arrangement, that the Company has acquired a valid title from the natives to a very large territory on both sides of Cook's Straits, to which they lay claim, and to which their settlements are to be confined. The colonial minister, upon that presumption, authorizes the selection by the Company (within six months of the receipt of a copy of the arrangement by your excellency) of certain portions of land within that territory, to the extent of four times the number of acres of pounds sterling expended by the Company, including 110,000 acres in the neighbourhood of Port Nicholson, and 50,000 acres in the neighbourhood of New Plymouth.

“The amount of acres thus to be selected will probably be found, when the account is taken of the Company's outlay up to that time, to exceed 600,000. At the same time a commission, to be named by her Majesty's government, is to decide on the validity of the presumed purchases from the natives by the Company. Under these circumstances, and pending the investigations of the commission, it seems desirable that purchasers of land from the Company, on the faith of this arrangement, should be enabled to locate themselves on land under your excellency's protection, and yet that no violation of the intentions of the government, as regards titles derived from natives, should take place. I therefore submit—

“First.—That an extension of time should be accorded to the Company by your excellency, for the selection of their lands, until the commission has decided on the titles; and—

“Secondly.—That to meet the other conditions of the arrangement, and to forward the prosperous settlement of this part of the colony, your excellency should guarantee to the British subjects who claim lands in New Zealand, as purchasers from the New Zealand Company, a sure and indefeasible title to all such lands as have been surveyed, or may be surveyed, for the purpose of satisfying their claims as such purchasers as aforesaid.

“Provided always, that if any part of the said lands shall, upon due inquiry, be found not to have

been validly purchased from them before the date of the alleged purchase by the New Zealand Company, full compensation shall be made to the natives, or the previous purchaser, as the case may be, by the New Zealand Company. In the case of the former, the compensation to be decided by the native protector, and an agent of the Company, or in case of difference, by an umpire named by them; and in the latter, according to the scale fixed in clause No. 6 of Sir George Gipps' act, in respect of claimants of land considered necessary for purposes of public utility, who might be dispossessed by the government. Provided also, that the New Zealand Company shall not, in any case, until the decision of the said commission, interfere with the site of any pah actually occupied by the natives, or with any place held sacred by them on religious grounds, or with any land hitherto unsold by the natives, and which they absolutely refuse to dispose of.

“I have, &c.,

“W. WAKEFIELD,

“Principal agent of the New Zealand Company.”

Colonel Wakefield forwarded a copy of the above letter to the directors in London. Their despatch to him, in return, bearing date April 30th, 1842,* proves how entirely their view of the agreement assimilated with that expressed by him, concerning the necessity it involved of extinguishing the native titles. In it he was assured by the secretary of the Company, that—

“The Court entirely approved and commended his conduct of the important negotiations with the governor; and that with reference to the claims of the natives alleged to be unextinguished, the directors, feeling the importance of placing the Company's title to the lands within its settlements above all doubt or question, authorize you to take such steps to that end as you may deem most advisable; and hereby place at your disposal, for that purpose, the sum of £500, and 1,000 acres of land.”†

Governor Hobson, on his part, notified to Colonel Wakefield, that the Crown would forego its right of pre-emption to certain lands, including the Wellington and Porirua district, 50,000 acres at New Plymouth, and 50,000 at Wanganui, and would grant to the Company legal titles to all such lands as might “by any one have been validly purchased from the natives, the Company compensating all previous purchasers, according to a scale to be fixed by a local ordinance.” This offer, the justice of which, so far as the “previous purchasers” were concerned, was at least questionable, was so decidedly favourable to the immediate interests of the settlers of the New Zealand Company, that Captain Hobson might reasonably have expected to find it gratefully accepted. On the contrary, we find Colonel

* Appendix to Select Committee of 1844; p. 544.

† Appendix to Report of Select Committee, 1844; p. 570.

Wakefield assuming the tone of an injured person, and informing the directors, that—

"Captain Hobson expressed himself favourable to my request, that he should guarantee a title to all past purchasers from the Company, as against white people; but positively refused to look upon the native title as fairly extinguished, by reason of the advantages secured to the aborigines by their reserved lands, and the introduction of civilization among them. This view of the subject, so inimical to the quiet progress of the Company's settlements," Colonel Wakefield adds, "has been taken by Captain Hobson, in consequence of his treaty of Waitangi."

The governor appears to have acted, both towards Colonel Wakefield and the natives, in good faith, and with a sincere desire to prevent hostilities he wrote to the former, assuring him of his readiness to sanction any equitable arrangement that might be made to induce the natives to yield up possession of their habitations within the limits of the territory before referred to, but at the same time warned him privately, that no force or compulsory measures for their removal would be permitted.

Captain Hobson clearly saw the gathering wrath of the natives; the chiefs who waited upon him on the occasion of his visit to Wellington, "expressed the greatest confidence in her Majesty's government, and their willingness to obey any order he might give them; but united in *demanding protection from the encroachments of the Company*, who they asserted had most unscrupulously appropriated their lands."* In November (13th), 1841, Governor Hobson transmitted to her Majesty's Secretary of State for the colonies, a report from the chief protector of aborigines, setting forth the hostile feelings of the Maories to the claims of the Company at Porirua, Wanganui, and Taranaki.

On every side the settlers were met by the aborigines with the most determined opposition. On the 12th March, 1842, Governor Hobson reported to Lord Stanley,—"the natives violently resist the claims of the Company at Wanganui, and seem to threaten pretty generally great opposition to parting with their lands throughout the districts sold by the Company." The Taupo tribe numbered 900 to 1,000 men; the Waitotera about 300; the Waikanai people, including their supporters from New Munster, at least 2,000. It was with extreme difficulty, that the Rev. Messrs. Had-

field and Mason, who had great influence over these tribes, prevented bloodshed, by assuring the chiefs that the proprietorship would hereafter be determined by the governor, or by a commissioner: the natives however declared—"you may take our land, but you shall break our necks first."†

Mr. Gilbert Francis Dawson, the police magistrate at Wanganui, in 1842, protested publicly in writing "against the settlers proceeding to occupy lands, the possession of which the natives declared they would defend with violence."‡

A few words must here be said of the formation of *Wanganui*, as an illustration of the plan adopted by the Company's principal agent to dispose of the unfortunate emigrants, of whom so many ship loads had been sent out by the London directors, before any due provision had been made for them.

Tyrone Power has given a short, graphic, and only too correct account of the place, and its unlucky founders. Wanganui, he says—

"Is one of the unwholesome mushroom settlements engendered by the New Zealand Company, for the purpose of removing to a distance a portion of the clamorous scrip-holders, who on arriving from England, looked, and looked in vain for their land. A prospectus issued by the agent of the Company, describing all imaginable advantages in this new Eden, and promising a town acre to all who would have their titles to land in the Wellington district transferred to Wanganui, was eagerly caught at by numbers of the gullible adventurers, who, with large families on their hands, and living at great expense in Wellington, without a hope of getting possession of the land originally assigned to them, were glad enough to see a prospect of settling themselves anywhere. The titles for *Wellington mountain and swamp* were exchanged for an equal quantity at Wanganui, with an addition of a town acre to every holder of a section of 100 acres; and the unfortunates were shipped off to a distance of 120 miles, where, clamour as they might, very little could be heard of them. Not a single individual was able to get possession of the land, with the exception of the town acre, which had formed the bait. On this many of them have vegetated up to the present day (March, 1847), now six years of hope deferred and disappointment."—*Sketches in New Zealand*, p. 81.

At Porirua matters were assuming as alarming an aspect as at Wanganui. Rangihiaia, the powerful chief already referred to (see p. 185), had, from the first, opposed the settlement of any of the land around the harbour, affirming that he had not sold, and would not sell it; that he wished it for his children, and would maintain his rights. He acknowledged himself a Bri-

† Parliamentary Papers on New Zealand, 12th August, 1842; p. 173.

‡ Letter dated Wanganui, 24th February, 1842; pp. 286—287. Appendix to Report of Select Committee, 1844.

tish subject, declared that he did not understand the "native reserves," and could not be certain that his children would enjoy them in perpetuity. In the early part of the year 1841, he caused the road, or rather track opened through the forest, to be blocked up, and the tent of the surveyor to be taken down; and repeatedly stopped the progress of the surveys. In consequence however, of being assured that whether surveyed or not, the Land Commissioners would decide with equal justice between him and the Company, he suffered the surveyors to proceed; but always under protest, and with an unqualified assurance that he would not allow a single person to settle in the Porirua district under the alleged purchase of Colonel Wakefield.

In defiance of Ranghiaiaata, and without waiting the decision of the commissioner, Colonel Wakefield issued leases of four sections near Porirua Harbour, of which, in April, 1842, the lessees proceeded to take possession, to build houses, and make preparations for the erection of a saw-mill. Two of the houses were nearly finished, and the other two had been commenced, when intelligence of these proceedings reached the chief, who thereupon gave notice that he intended to pull down the houses, which he did on the following day, coming for the purpose attended by a large body of natives. "No unnecessary violence, however, was employed, and no wilful destruction of property was committed."*

The first accounts of this occurrence which reached Wellington, were of the most exaggerated nature. A warrant was obtained for the apprehension of Ranghiaiaata, but not attempted to be carried into effect; and a public meeting assembled at Wellington to consider the course to be adopted. Mr. Hanson (the Crown prosecutor), was present, and heard an avowal publicly made by Colonel Wakefield, as agent of the New Zealand Company, of a course of proceeding so totally at variance with the true interests, both of the British and Maori population, that he deemed it his duty, as holding an official and responsible position, at once to report it to the governor.

Without pretending to give the exact words used by Colonel Wakefield, Mr. Hanson declared that he could vouch for the substantial accuracy, in every particular, of

* Vide Mr. Hanson's letter to Governor Hobson, printed in 1842.

the reply made by him to certain questions put by one of the settlers, to the effect,— "had he done his utmost to give the purchasers under the New Zealand Company, peaceable possession of their lands?" Colonel Wakefield's answer was, that—

"On the occasion of Ranghiaiaata having blocked up the road, he had applied by letter to Mr. Murphy, and he read a copy of the letter; that when the governor was in Port Nicholson he had referred to the same subject, and had requested the presence of troops, which had been refused on the ground of the inadequacy of the force in the colony; but that he had not treated with the natives for a settlement of their claims. He added that he had not been very strenuous in his applications to the government, for although his instructions from the New Zealand Company directed him to yield all assistance in his power to the government, yet the directors did not wish him to take any pains to procure the removal of inconveniences by means of representations to the governor; they rather wished these inconveniences to be employed as grounds of complaint against the government, and as arguments in aid of their efforts for the removal of the governor. With a noticeable inconsistency, he however attributed the non-interference of your excellency to a settled design to injure this settlement, and concluded by reading a letter which he had addressed to the directors in England, complaining of the want of efficient protection in this and other particulars."

Mr. Hanson adds,—

"Here is an individual to whom a public body in London has thought fit to entrust, so far as they are able, the management of affairs involving the property of hundreds whom they have encouraged or induced to emigrate to this colony, openly proclaiming that he has consciously risked the destruction of property, and has even hazarded the loss of life, by refusing to take the measures within his power to settle the claims of the natives, in order that the evils which he had encouraged might be made a ground of complaint against the governor."

The arrangement entered into by Governor Hobson with Colonel Wakefield, by which the claims of the New Zealand Company to land were to be held valid as against all save native titles, and the ordinance passed by the governor and the Legislative Council in confirmation of this argument as an amendment of the ordinance of June, 1841, created great dissatisfaction among those whose prior claims were thus to be over-ridden by the Company. The new ordinance was disallowed by the home government, and the preceding one remained in force; but a portion of the population, numbering some of the oldest and most respectable settlers, were kept meanwhile in a state of feverish suspense. The natives likewise began to look upon the proceedings of the local government with suspicion and distrust in which feelings they were encour-

aged by disaffected Europeans. Captain Hobson, however, took an excellent means of disabusing them, by issuing a gazette in the Maori language, and distributing it among the chiefs, who were really very far from having any rightful cause of complaint against him, except that of not having sufficiently defended them from the encroachments of the settlers of the New Zealand Company, which he was quite unable to do. His own dealings with them for land had been perfectly straightforward; his experience in New Zealand, previous to being appointed lieutenant-governor or even consul, had convinced him of the difficulty of inducing the natives to alienate any considerable tract of country, and in procuring the quantity required by the exigencies of his position, he had judiciously employed the mediation of the missionaries.

The investigation of the claims of the New Zealand Company commenced on the 16th May, 1842; when Mr. Spain, who had been sent from England as special commissioner, opened his court at Wellington on that day.

Both Colonel Wakefield and the chiefs welcomed him warmly, and expressed themselves willing to abide by his adjudication; the latter assuring him of their perfect confidence in her Majesty's government, adding that their only wish was to be allowed to live peaceably with the Pakeha (stranger), and to cultivate the lands to which they were habituated, but that the boundaries of the land of the white man and of the Maori must be clearly defined.

Colonel Wakefield on his part showed equal pleasure at the arrival of Mr. Spain, who, he informed the directors, a few days before the opening of the court, "sincerely desires to settle the question of titles, with a view to the speedy and prosperous colonization of the country."

Dr. Evans appeared as counsel for the Company, to prove their purchases from the natives, but afterwards gave up to Colonel Wakefield, at his request, the advocacy of the cause, which the latter conducted in person for three days, and then again entrusted it to Dr. Evans. The claim to the Port Nicholson district was the first investigated, and all went on smoothly until Mr. Spain having examined Messrs. Dorset, E. J. Wakefield, and E. Puni, as witnesses for the purchase, required more evidence, which Colonel Wakefield declared to be quite unnecessary. Mr. Spain's persistence in this demand appears to have made him

for the first time aware that the investigation was not to be carried on as a mere form, but that it was really intended to give all parties a fair and impartial hearing. Upon this he immediately assumed a different tone, endeavouring by every means in his power to embarrass and impugn the acts of the commissioner, and indirectly and by inuendo to deny the jurisdiction of the commission. The counsel for the Company kept the commissioner daily waiting for hours after the opening of the court, by failing to bring before him natives living in the neighbourhood, who were said to have been parties to the conveyance to the Company of the Port Nicholson District.

Colonel Wakefield apprized the directors of the course adopted by Mr. Spain, expressing his surprise at the "searching inquiry" that had been set on foot, instead of, as he had expected, one which should have been "little more than a matter of form." He adds,—

"At the same time I was not forgetful of the assumption in the agreement (of November, 1840), that the lands had been purchased from the natives, and of some passages implying a proposed investigation into the titles; still less could I put out of sight the mischievous treaty of Waitangi. * * * In assuming the native title to be extinguished, and in appropriating the land, the Government would be conferring a positive benefit on the aborigines."*

On the receipt of this intelligence, Mr. Somes, on the part of the New Zealand Company, immediately addressed Lord Stanley (24th October, 1842), and asserted *for the first time*, that the title of the Company to land in New Zealand was derived from the agreement with the Crown of November, 1840, and was in no manner dependent on the validity of its original purchases from the native chiefs. This communication was followed by a long correspondence between the Colonial Office and the Company, in which the latter adhered to the view of the agreement above stated, and the former entirely dissented, maintaining that the Company were only entitled to confirmatory grants from the Crown of lands of which they had previously extinguished the native titles by purchase.

In September, 1842, Governor Hobson died at Auckland, his demise being without doubt accelerated by the numerous and increasing difficulties of his position, embittered as they were by factious and malicious opposition. Although it is difficult to form

* Appendix to Report of Select Committee of 1844; pp. 291 295.

a fair estimate of his abilities as a financier, from his conduct under the peculiar difficulties of his brief and troubled administration, it is yet scarcely possible to exonerate him from the charge of having committed that grave error in the governor of an infant colony, of entering upon a system of expenditure not warranted by its available resources. Strict frugality would have been the best and most honourable example the local government could have shown; if the colonists could not appreciate or would not follow it, the blame would have rested with them. One of the influences which tended to induce the adoption of an opposite course, was the existing state of affairs in Australia at the period of the establishment of British authority in New Zealand. Speculation was then at its height, and money abundant. Extravagance of every kind spread thence to New Zealand; every one lived beyond his means; money was borrowed at exorbitant rates of interest for the purpose of purchasing land, especially town allotments and water frontages, houses were built on a scale far exceeding the reasonable requirements of a small and struggling community, and farms were laid out which could not be stocked or cultivated, without much greater means than their owners could procure. The erroneous policy of offering lands for sale by auction, at a high upset price, though at one time the means of drawing some thousands of pounds to the government coffers, was really injurious to all parties by the reaction it caused; to the settlers especially, because it drew from them the capital which might profitably have been invested in the tillage of the soil, and to the governor also, by leading him to form and act upon an exaggerated estimate of the local resources. The expenses attendant upon the government of six or seven distinct and widely scattered settlements, several of them established in defiance of the natives, who as strongly as the colonists, and with equal right, appealed to Captain Hobson for protection, were necessarily very heavy. The whole revenue which could be collected in 1840, to meet an expenditure of £19,798 was only £926; that of 1841 (exclusive of the money raised by land sales, a large portion of which was to be appropriated to emigration purposes) amounted to but £5,507, while the expenditure had increased to £34,743. The treasury of New South Wales contributed in 1840, and up to May, 1841, £43,347 in the form of a loan; this

resource was then stopped. Even the land sales at Auckland (to which fund the embarrassed governor was compelled to resort as the only available means of meeting the exigencies of his position) had greatly disappointed his expectations, having yielded in 1841 only £27,559, instead of the £50,000 which had been confidently anticipated. In January, 1842, Captain Hobson wrote to Lord Stanley, that it was "utterly impossible to carry on the government of the colony without the assistance of the home government," and soon after he commenced drawing bills on the British Treasury, with the advice of his Executive Council, intending to do so to the amount of £25,000, to cover the deficiencies of the year 1842. The Lords of the Treasury decidedly objected to these proceedings, but consented to meet the bills to the extent of £10,000, announcing at the same time that any future bills so drawn would be dishonoured. Before this intelligence reached the colony, Governor Hobson was deceased, and the Colonial Secretary, Mr. Willoughby Shortland, temporarily assumed the reins of government. The permission given by Governor Hobson to the Company's agent to make an equitable arrangement with the Maories at Port Nicholson for the cession of their rights was renewed by Mr. Shortland, before whom Colonel Wakefield, accompanied by Mr. Spain, proceeded to Auckland, to submit a correspondence with the commissioner, wherein he says:—

"With a view to the final settlement of a question upon which the prosperous settlement of no inconsiderable portion of these islands depends, *I propose* on the part of the New Zealand Company, to abide by the decision of yourself (Mr. Spain) and the Protector of Aborigines, Mr. Halswell, as to the amount of compensation to be made by the Company to all natives, in cases of disputed possession of, or title to, land."

To this proposition the acting-governor agreed, leaving the detail to be arranged at Wellington; referees were appointed, and Mr. Spain undertook to act as umpire. In September, 1843, Mr. Shortland learned, that although the land commissioner and protector of aborigines had been arduously engaged in negotiating for the adjustment of the native claims, their efforts were rendered abortive by "the Company's agent having failed to carry out an arrangement entered into *at his own request, and solemnly confirmed at a meeting with the native chiefs at Port Nicholson.*"*

* App. to Rep. of Select Com. 1844; pp. 332, 333.

ADMINISTRATION OF GOVERNOR FITZ-ROY. —When the intelligence of the death of Captain Hobson reached England, the Secretary of State for the Colonies, Lord Stanley, offered the vacant governorship to Captain Fitz-Roy, R. N., who had then newly completed an interesting *Narrative of the Surveying Voyages of H.M.S. Adventure and Beagle, between the years 1826 and 1836, in the Southern Hemisphere.*

Towards the close of this expedition, of which for the greater part of the time he had held the command, Captain Fitz-Roy visited New Zealand, and on his return home, in the volumes referred to, and in his evidence before the select committee of the Lords in 1838, had evinced considerable acquaintance with its actual state, and ably expressed his opinions on the character and capabilities of the aborigines. Captain Fitz-Roy accepted the appointment, although it involved the resignation of his seat in Parliament (for the city of Durham), and of his honourable and lucrative position as an elder Brother of the Trinity-house, and as Conservator of the Mersey, in exchange for a most arduous, and (then) scantily remunerated office at the antipodes. The conscientious motives which actuated him were evident, and all really interested in the welfare of the colony, especially the Church and Wesleyan Mission Societies, rejoiced in the appointment of a governor, whose personal character and station in society peculiarly fitted him to stand in the breach between the two races, as a successful mediator. Neither Captain Fitz-Roy, however, or any other individual in this country, and few even in New Zealand, could then form an adequate idea of the difficulties which awaited him, and which had rapidly augmented in the few months immediately succeeding the death of Captain Hobson.

In the first place the ill feeling between the Europeans and the Maories, was becoming daily more evident; both parties were brave, and in too many instances inclined to settle their disputes by the trial of battle, the former especially from having formed a very false estimate of the courage of the natives, who *as heathens* are essentially warlike, but *as Christians* exhibit a practical conformity with the peaceful doctrines of the gospel, which communities far more advanced in the arts and sciences of civilized life would do well to imitate. The proportion of real converts to our holy faith, was, it is true, in New Zealand as elsewhere,

very inferior to that of merely nominal ones, but still this influence had no small share in inducing their countrymen not to commence hostilities with the *Pakeha* (strangers), who had encroached on their territories, but to abide the decision of the land commissioner. This was in itself a great point gained, considering the overwhelming superiority which more than one hundred thousand natives, *supplied by Christian colonists with fire-arms and gun-powder in abundance*, and with fortified pahs and mountain fastnesses to resort to, in time of need, could not but have over a few thousand Europeans, residing in widely scattered settlements, possessed of nothing deserving the name of military defences, and with women and children to protect.

Yet though remaining passive, the natives watched with no unreasonable alarm, the arrival of ship after ship full of emigrants, and openly avowed their fear that the settlers were only waiting for a sufficient increase of numbers and force, to appropriate their lands, and reduce them to the condition of slaves. A very high tribute to their conduct during the trying period of the investigation of the land claims was given by the commissioners who assisted Mr. Spain (Colonel Godfrey, and Captain Richmond) who when officially asked by the acting governor (on the 4th May, 1843,) whether the conduct of the natives in the investigation of the land claims had not caused a great alienation of feeling between the parties? and whether a disposition had not in some cases been manifested to get returned to them lands which they had formerly sold? informed him in reply, that they had then examined more than half of all the claims, yet had never remarked such a consequence in any of their investigations. In some instances, boundaries had been inserted by the purchasers, *after* the signature of the deeds by the natives; then the latter, while admitting that some of the land mentioned had been sold, boldly denied, and with apparent truth, the extent alleged to have been alienated, and willingly pointed out to the surveyors the lands actually sold. Even the natives more than ordinarily dissipated, and corrupted by habits of intoxication, never, say these witnesses, "made any unjust attempts to repossess themselves of their lands." Except on most rare occasions, "when the morality of the buyers appeared quite as questionable as that of the sellers," the commissioners could "scarcely recal

to mind a single investigation in which the testimony given by the natives was not deserving of the most entire credibility."*

The English on their part, misunderstanding the cause of the forbearance of the natives, behaved most unwisely, evincing a diminishing regard for the rights, and for the feelings of the chiefs, excluding them as much as possible from their dwellings, instead of welcoming them as at first, and threatening them on trifling occasions with the penalties of British law; while some designing or imprudent persons told them that they were now the slaves of Queen Victoria, who had the entire control of their country, and of themselves, adducing in proof that they were no longer permitted even to dispose of their own land.

A high spirited race, democratic in the extreme, as regarded others, but equally aristocratic in respect to their own rights and dignities, keenly felt and warmly resented these taunts; they found they were indeed no longer the principal personages in their own country; they saw the land which they had parted with for a trifling consideration (long since consumed), resold for perhaps twenty or thirty times the value they had received; fences were rising in every direction, by which they were prevented freely traversing the country as heretofore, and more than all, when they offered some of their lands to the governor for sale, they were informed that he could not buy (not having the necessary funds), and that they must not sell to any one else.

The colonists themselves were divided into three distinct and antagonistic classes,—first, the independent settlers at Auckland and elsewhere, who felt aggrieved by the

concession of their just and prior claims made by Governor Hobson and Lieutenant Shortland to Colonel Wakefield; second, the population of the New Zealand Company's settlements, who were living in a state of open hostility to the local government, and were besides (not without excuse), jealous beyond measure of one another—the Wellington, of the Nelson people—the Wanganui adventurers, of their brethren at Porirua, and so on; the third class consisted of whalers living in widely scattered stations along the coast-line of the three islands, some of whom had married native women, and were earning an honest livelihood; but the greater portion were escaped convicts or runaway sailors, leading lawless and immoral lives, and neglecting no opportunity of prejudicing the minds of the heathen chiefs against any and every form of government calculated to restrain their excesses.

The proceedings of the Company, in repudiating the arbitration of the land commissioner so soon as they found it unfavourable to themselves, notwithstanding their voluntary and public promise to abide by it; their refusal (made through their authorised agent,) to compensate the natives or previous purchasers, in violation of the condition on which alone they had been suffered to hold any portion of the lands in dispute;† and their strenuous endeavours to induce the government to set aside the treaty of Waitangi—placed great difficulties in the path of the representative of the Crown. The missionaries, on their part, beheld the new position assumed by the Company, with alarm and indignation. They steadily refused to countenance any

* Appendix to Report of Select Committee, p. 334.

† Mr. Commissioner Spain says that Colonel Wakefield's conduct in this matter, produced in his mind "the inevitable conclusion, that on no future occasion would it be safe for the government to enter into any similar negotiation with the principal agent of the Company, who could so far overlook his own moral and legal obligations, in a case at once involving the just pretensions of the aborigines, the ruin or prosperity of a large and respectable body of enterprising settlers, and the good faith and substantial interests of the Company—his employers."—(Appendix to Report of Select Committee, p. 305.) Among the settlers generally, whether sent out by, or independent of the Company, a strong feeling of indignation appears to have been excited by Colonel Wakefield's proceedings (see Appendix to Report of Select Committee for 1844, p. 231); and an able local historian, Dr. S. M. D. Martin (subsequently a

member of the Legislative Council of New Zealand), comments severely upon them; placing, however, the blame far too exclusively on the agent, who, there is reason to believe, strictly adhered to the orders he received from England. After alluding to the "mess" which Colonel Wakefield "had made of the Company's affairs at Wellington," Dr. Martin observes, "it appears to me, that what is called a *cunning man*, is never fit to manage affairs properly for another party, because he invariably keeps them in the dark regarding his operations; and such, I am certain, has been the case with the agent of the New Zealand Company. Had he honestly informed them of the facts of the case regarding his *pretended purchase at Port Nicholson*, matters might have been rectified long before now. As it is, this vainly-wise man has ruined both the Company and the private individuals who were unfortunate enough to purchase their lands."—*New Zealand, with Historical Remarks, &c.*, London, 1845, p. 160.

infraction of the treaty, the letter and spirit of which, they considered, alike vested the proprietary right to the whole of New Zealand, in the natives, and declared, that on that understanding only, they had assisted Captain Hobson in obtaining the consent of the chiefs, who could not have been induced to sign it upon any other condition.

Another cause of embarrassment, which embittered and aggravated every other, was the financial distress of the colony; the land-fever had subsided, and the torpor of reaction had taken its place. The brisk trade for pigs, potatoes, and native labour, which on the first arrival of the emigrants was so lucrative, had, to a great extent, ceased, partly by reason of the mercantile pressure, and partly from the absence of an adequate monetary circulation.

The delusive hopes which the colonists entertained on their arrival, of being able at once to become exporters, had been soon dispelled; a very short time having sufficed to show that there was, at that time, no article of export in New Zealand, which could be depended upon to procure the balance of trade necessary to the success of a commercial community. Timber, flax, and oil, were the three articles on which the most sanguine expectations had been founded. With regard to the first, they were rendered nugatory by the great expense of bringing it to the water-side, added to that of shipping it to a distance of 14,000 miles, and further by the fact of large and sound spars being comparatively scarce.* The shipment of a different description of wood, at that period, was quite out of the question, the price of sawn timber in New Zealand itself, in 1841-2, being 32s. per 100 feet; and the importation of planks from Europe having met with success.

The export of flax prepared by the natives had dwindled away almost to nothing, as their increased intercourse with Europeans had enabled them, by a slight degree of agricultural labour, to obtain all the commodities they required. The abundance of this valuable plant was, therefore, of little benefit to the colonists, who had vainly sought to discover a cheap mode of dressing it.

The export of oil had proved equally

unsatisfactory, for from the ruthless and improvident manner in which the whale-fisheries had been conducted during a series of years, without regard to the preservation of the dams or their young, during the calving season, a profitable and important trade had been well-nigh destroyed.

It had been confidently assumed that the ships of the several nations engaged in the whaling trade, would resort to New Zealand for refitting, as being the centre of the southern whale-fishery; instead of which, on its becoming a British colony the whalers deserted it, and went to Otaheite, or some other of the Polynesian Islands, where they could obtain supplies at a cheaper rate, without the intervention of Custom-house regulation or fiscal dues.

Before leaving England, Captain Fitz-Roy solicited from Lord Stanley special instructions on certain points regarding the land question, of which the first was—to whom should land belong which had been validly purchased from New Zealand aboriginals in excess of the quantity (2,560 acres) prescribed by the land ordinance of 1841? His lordship replied, the excess was “vested in the sovereign, as representing and protecting the interests of society at large.” In other words such lands would become available for the purpose of sale and settlement.

This decision caused great dissatisfaction in New Zealand, where the prerogative of the crown in annulling all purchases made by its subjects without its consent, was very imperfectly understood. Yet the hardship, as far as the buyers were concerned, was greater in seeming than reality, when the extremely low price at which most of the purchases had been effected is taken into consideration, and also the liberal scale on which all just claims were to be confirmed, in the proportion of an acre for every crown expended in colonizing. Besides which, the lands held under the award of the land commission, were enhanced in value by the appropriation of the surplus by the sovereign as trustee for the public to redispense of them, or render them available for purposes of general utility; and yet more by the guarantee for the security of life and property afforded by the presence of British authority.† With respect to the sellers, the question arises whether a conside-

* The Cowrie or Kauri timber is not found farther south than the districts of Auckland and Manakao.

able and defined portion of the surplus of the land commissioners' award ought not to have immediately reverted to them as having been parted with under a misapprehension of its value, or have been appropriated in some special manner for their sole use and benefit.

The next inquiry was—"Under defined restrictions, may the Crown's right of pre-emption be waived in certain cases? Lord Stanley declined giving an answer until he should receive a local report from Captain Fitz-Roy, accompanied by such suggestions on the subject as, after inquiry on the spot, he should deem it expedient to make. In offering these suggestions, two points were to be particularly kept in view, viz., the prevention of land coming into the possession of Europeans at a cheaper rate if bought from the natives than if bought from government, and the ensuring a contribution on such purchases being made from the purchaser to the emigration fund."*

The information and instructions given for the guidance of Captain Fitz-Roy in his dealings with the New Zealand Company and their agents was to the effect, that the government would confirm their title to as many acres as they had expended crowns in purchase, emigration, &c., provided they proved the validity of their purchase; and to facilitate the adjustment of their titles, a *prima facie* title to the district included in the original agreement, was conceded to them under the condition that the validity of their purchase should not be successfully impugned by other parties. The Company were to be allowed to take land without the districts claimed by them in exchange for an equal quantity of land claimed by them within those districts, provided that their purchase should be satisfactorily proved.

Lastly, Captain Fitz-Roy was assured that

there was no reason for saying that any specified quantity of land was due to the Company from the government (unless under direct purchases from itself), or that the government was bound to make compensation to the Company for its expenditure.†

Thus the grant from the Queen depended in the first instance on the extinguishment of native or other proprietary rights by Colonel Wakefield. How could it be otherwise, since even supposing the government to have been disposed to bestow on the Company, in return for systematic insult and wilful misrepresentation towards itself, and deception and charlatanism towards the public, a free grant of about a million acres, it had not the power to do so, without first purchasing them from the native or other proprietors.‡

If the loudly vaunted validity and liberality of the purchases of their agent, which had received the unqualified approbation of the directors, conveyed in the substantial form of a present of a thousand guineas and an increase of salary, should on investigation prove worthless, by whom was the penalty to be borne? Were the taxes of the people of England to be augmented because a body of individuals associated for a "purely commercial speculation," had overreached themselves? or were the natives of New Zealand to be defrauded under the pretence of being protected by an unrighteous administration of the laws, under whose jurisdiction they had freely placed themselves.

The latter was the mode of procedure avowedly anticipated by the Company, whose expectations were completely disappointed by the searching investigation instituted by the land commissioner into the grounds of their so-called purchases. On receipt of this intelligence the directors, as we have

† Appendix to Report of Select Committee, 1844, page 106.

‡ "The mode in which it was intended that the local government should procure land with a view to reselling it, is stated in Lord Normanby's letter of August, 1839—"The resales of the first purchases that may be made will provide the funds necessary for future acquisitions, and beyond the original investment of a comparatively small sum of money, no other resources will be necessary for this purpose." To suppose that Lord John Russell intended to grant to the Company for nothing, nearly a million of acres so acquired, is obviously incompatible with the very fundamental principle of such a sys-

tem; to suppose that he intended to apply either to parliament or to the local legislature for a grant to enable him to make a special purchase for the benefit of the Company, is to hazard a supposition for which not the slightest ground of probability can be shown. But neither will the letter of the arrangement itself bear out any such construction."—See *Memorandum* on the twelfth Report of the Directors of the New Zealand Company in refutation of the assertion of the directors, that "the flagrant character of the wrong done to their shareholders by Lord Stanley's interpretation of Lord John Russell's agreement virtually annuls that contract between the Crown and a body of her Majesty's subjects."—Appendix to Report of Select Committee of 1844, p. 1.

seen, immediately assumed a new position, by endavouring to place upon the agreement of 1840 a construction which up to that time they had never even hinted at,* and which was at once declared by the government to be wholly unwarranted. (See page 191, div. v.)

Yet they persevered with their accustomed tenacity, in maintaining the view of the case which favoured their interests; although contrary to truth and common sense. Laying aside the statements and the arguments they had formerly used, they adopted with marvellous facility, directly contrary ones. For instance, in the earlier stages of their proceedings, they had been among the strongest advocates for the national authority and individual rights of the Maories to the proprietorship of the whole soil of the three islands; their reports, books, and newspapers had teemed with eulogy of the natives, whose amalgamation with the Europeans by marriage was urged as probable and desirable, while their shrewdness and capacity for understanding and entering into engagements or contracts was highly lauded. Hence, when Colonel Wakefield first landed at Port Nicholson, he hoisted the *national* flag of New Zealand, and his three contracts made the 27th of September, 25th of October, and 8th November, 1839, for the purchase of "about twenty million acres" were written with all the formality of a legal conveyance. But when the directors found that Lord John Russell refused to acquiesce in the "claim advanced by the Company to have acquired from the natives a title to *one-third* of the whole territory of New Zealand;"† and that those natives, whose shrewdness and sagacity they had so highly lauded, were on their part determined to maintain and defend their possessory rights to the soil, by means of the muskets and gunpowder with which they had themselves furnished them, in defiance of the precepts and example of the missionaries,—then an entire change of policy and language took place; the continuous measures adopted by her Majesty's government in regard to New

Zealand, were designated,—*shams, lies, † solemn grimace, fiction, foolery, fuss, and humbug*; the whole race of aborigines were described as something worse than savages and cannibals, and the treaty of Waitangi (well called by Captain Fitz-Roy, the *Magna Charta* of New Zealand), which had been approved and ratified by the Queen, and was as binding in all its provisions as any treaty into which the Sovereign of England ever entered, was thus spoken of by the governor of the New Zealand Company,—

"We have always had very serious doubts whether the treaty of Waitangi made with naked savages, by a consul invested with no plenipotentiary powers, without ratification by the Crown, could be treated by lawyers as anything but a praiseworthy device for amusing and pacifying savages for the moment."§

The answer of Lord Stanley to this extraordinary communication was worthy of his name, and of his position in the cabinet of his sovereign. His lordship, through Mr. Hope,|| reminded Mr. Somes that he had previously offered on the part of the Crown, as a matter not of right, but of grace and favour,—

"To instruct the governor to make them a conditional grant, subject to prior titles to be established as by law provided, not only of such portion of the Wellington settlement as is in the actual possession of settlers under them, but also of all parts not in the occupation or possession of others; the extent of such grant, of course, not to exceed that to which they are entitled under Mr. Pennington's award. Further than this, Lord Stanley cannot consent to go, consistently with the obligations by which the Crown, as he conceives, is bound. Lord Stanley is not prepared, as her Majesty's Secretary of State, to join with the Company in setting aside the treaty of Waitangi, after obtaining the advantages guaranteed by it, even though it might be made with 'naked savages,' or though it might be treated by lawyers as 'a praiseworthy device for amusing and pacifying savages for the moment.'"

"Lord Stanley entertains a different view of the respect due to obligations contracted by the Crown of England, and his final answer to the demands of the Company must be, that as long as he has the honour of serving the Crown, he will not admit that any person, or any government acting in the name of her Majesty, can contract a *legal, moral, or honorary obligation to despoil others of their lawful and equitable rights.*"¶

The new governor, before leaving Eng-

* On the contrary, in the third Report of Directors of New Zealand Company of May, 1841, page 4, it is expressly stated that "the Company has been put in regard to its purchases of land previously to the date of Governor Hobson's proclamation, on *precisely the same footing as any private individual.*"

¶ The late Sir Robert Peel, in speaking of the treaty of Waitangi, took the same view of it as Lord Stanley; he said in the debate in the House of

land, made several attempts (as his predecessors, Captain Hobson and Lieutenant Shortland had done,) to obtain the force he deemed indispensable under the peculiar circumstances of the colony, to the support of an effective administration; he pointed out in the strongest manner the necessity both of troops and of a ship of war being permanently stationed there. His verbal and written applications, alike met with decided discouragement, and it was even proposed to withdraw the handful of soldiers of the line then at New Zealand, and substitute in their stead 100 marines for the protection of the whole of the scattered settlements until a militia could be raised in the colony.

Captain Fitz-Roy therefore was given to understand that he must depend solely on moral influence for the maintenance of the Queen's government, and for the protection of the lives and property entrusted to his guardianship. He left England in July, and reached Sydney, New South Wales, in November, 1843. Here he received tidings calculated to impress him most forcibly with the sense of the necessity for the exercise of the utmost discretion, judgment, and promptitude, in the adjustment of the land claims, as, under providence, the sole means of averting a war of extermination between the two races. A fearful tragedy had resulted from the persistence of the Company's agents in surveying land at the Wairau, without the sanction of the local government, and in defiance of the threats and entreaties of the native proprietors, who had repeatedly urged them to wait the decision of the land commissioner, appointed by their mutual Sovereign to judge between them. Here we may resume the narrative (see p. 186, div. v.) of Mr. Tuckett, the chief surveyor; himself an important actor in the scenes which he graphically describes:

"The survey of the Wairau Plain having been let in three contracts, the contractors, Messrs. Barnicoat and Thompson, Mr. Cotterell and Mr. Parkinson, each with as numerous a party of labourers as could be advantageously employed, proceeded to the Wairau. An interruption of the survey on the part of the native claimants being under the circumstances highly probable, a clause for indemnity in case of loss to the surveyor by such interruption was appended to each tender, and acquiesced in by the

Commons, 19th June, 1845, "it is an absolute engagement, which, according to a proper construction of it, ought to be respected. Whatever are the honourable engagements which this country has contracted, they ought, in my opinion, to be fulfilled. I ask, will you commence your relations with the colony by an abandonment of the relations you have

resident agent on the part of the New Zealand Company. At the outset the contractors encountered some annoyance and obstruction from the resident natives, especially in sawing timber for staking the sections of the survey; but as the latter refrained from any actual interference by force, the contractors were enabled, by good temper and quiet perseverance, to proceed rapidly with the execution of their contracts, and Messrs. Barnicoat and Thompson had already nearly completed theirs, when tidings reached them that Rauperaha and Ranghiaiaata had crossed the Straits from the Northern Island, accompanied by an armed force, with the intention of entering the Wairau, and removing the surveyors. The contractors, therefore, dispatched a letter to Nelson, requesting the chief surveyor to come to the Wairau, to examine and certify the sections which had been surveyed, as also to endeavour to induce the chiefs from the Northern Island to allow the surveys to be completed. On receipt of their letter, the chief surveyor, accompanied by Mr. Patchett, the principal agent for absentee proprietors of land, immediately left Nelson, proceeded to the mouth of the Wairau river, where he was met by Mr. Cotterell, who informed him that his survey-station had been visited on the previous day by Rauperaha, Ranghiaiaata, and their men, in two large canoes, that they had burnt his hut, or warré, and compelled him and his assistants to leave the spot, and proceed to the old pah at the mouth of the river. Mr. Cotterell likewise stated that Mr. Thompson had already started with most of their men to return to Nelson overland, having completed their contract, but that Mr. Barnicoat remained, with one or two men, to take care of their effects, and wait the inspection of the survey; adding that he believed the chiefs were then in search of Mr. Parkinson and his party, and intended to bring them also down to the pah at the mouth of the river. The chief surveyor hastily wrote a few lines in pencil to the resident agent, stating the circumstances as related by Mr. Cotterell, and his (Mr. Tuckett's) intention to endeavour to remain at the Wairau until he heard from him. This communication he forwarded by Mr. Cotterell, who, at his request, left immediately with his men for Nelson. The chief surveyor then went up the river in his boat as far as Mr. Cotterell's survey station, and pitched a tent on the spot on which had stood the warre of Mr. Cotterell, Mr. Moline, Mr. Cotterell's assistant, accompanying him. The next morning, leaving the boat and its crew, with instructions not to offer any resistance to the natives, other than by not being removed unless carried, should they interfere with them in his absence, which he intended should be for three or four days, accompanied by Messrs. Patchett and Moline, he walked inland in quest of Mr. Parkinson's station, and on coming within sight of it observed a party of armed natives around it, and one or two on the roof, apparently keeping watch. Accosting the native who appeared to be the leader of the party, he inquired for Rauperaha and Ranghiaiaata, and being informed that they were away in the wood, he desired him to go to them, to acquaint them of his arrival, and tell them

entered into. I will say that if ever there was a case where the stronger party was obliged by its position to respect the demands of the weaker; if ever a powerful country was bound by its engagements with a weaker, it was the engagement contracted under such circumstances with these native chiefs."

that he was going to examine a plain called the Kaiparatahau, to the east of the Wairau, whence he expected to return in three days to Mr. Cottrell's station, and should wish the chiefs to meet him there. The natives undertook the errand, and offered no incivility or any opposition to his going away to the Kaiparatahau. This party of natives, although they had just arrived at that station, had not encountered Mr. Parkinson or any of his party, who were at work at some distance from their usual lodging and store-houses.

"The chief surveyor on his return from the Kaiparatahau found Rauperaha and Ranghiaiaata, with their followers, at Cottrell's station, waiting his arrival, together with his own boatmen and Mr. Parkinson's party, none of whom had received any ill-treatment from the natives. Rauperaha addressed him calmly and civilly, informing him why he had obliged Cottrell and the other surveyors to leave the ground, and requiring him also to quit the Wairau. The chief surveyor explained to Rauperaha that it would be doing an injury to the surveyors and their men, who maintained themselves by the wages obtained by work, to prevent them proceeding with their contracts; also that he had sent Mr. Cottrell to Nelson with information of Rauperaha's arrival and interference, and that he expected his superior, the resident agent, would come down on receipt of the intelligence, with whom they could discuss the question of right; meanwhile he felt bound to wait Captain Wakefield's arrival or reply. Rauperaha would not consent to the delay, and desired him to direct his own men to remove the tent, &c.; on his refusing to do so, Ranghiaiaata came towards him, and, with much violence of manner, ordered him to be off, reminding him of the warning which he had given him at Nelson not to come there—adding, that if he was so fond of the Wairau, he (Ranghiaiaata) would bury him there. However, on the chief surveyor telling him quietly that he would have nothing to say to him unless he could keep his temper, and behave as a gentleman and a chief ought to do, Ranghiaiaata took the reproof in good part, and walked away. Notwithstanding his passionate temper, it was evident that he was restrained by Rauperaha, who acted in accordance with his promise given at Nelson, 'that if they did go to the Wairau no violence should be done them.' After a pause Rauperaha came forward again, and explained that on leaving Nelson he went to the Queen's commissioner (Mr. Spain), informed him that the survey of the Wairau was likely to be commenced, notwithstanding his remonstrance, and requested him to prevent all discord by appointing an early day to investigate the claim. That the commissioner had appointed a day, and that he (Rauperaha) promised in return that the natives would not previously enter the Wairau, or interfere with the surveyors. That they had crossed the Straits, and remained at Tory Channel and Port Underwood, until a week later than the time appointed by the commissioner, when finding that he did not come, and knowing that the survey was going on, and that if finished they should lose the land, they entered the Wairau and stopped the survey. Rauperaha professed himself still willing to appeal to the decision of the commissioner, and again requested the chief surveyor to have his tent, &c., removed by his own men. The latter repeated his refusal, claimed the right to remain on the ground, and expressed his intention to do so until he had received a reply from Captain Wake-

field, upon which Rauperaha ordered his men to remove the tent, &c., to the boat. This being done, the chief surveyor considering any further opposition needless and useless, embarked with his party, and, accompanied by the two chiefs in their canoes, proceeded to the pah at the mouth of the river. The weather had been fine; but the wind, which blew strong in the straits subsequent to Mr. Cottrell's departure, still continuing, the natives represented to the chief surveyor that he could not go out with safety, and showed no impatience for his departure, although for three days the surf at the mouth of the river (the gale of wind heaping up the bar) was in their opinion too great to be safely encountered. During that time Ranghiaiaata and his followers evinced neither ill-will nor exultation, but they kept aloof, seeking neither favour nor intercourse.

"As the contractors were entitled to compensation, in the event of loss incurred in the survey, the chief surveyor inquired of Mr. Barnicoat and Mr. Parkinson, if any of their property had been taken by the natives. The latter informed him that one of his men had lost a handkerchief and a bill-hook, which he had seen in the possession of one of Ranghiaiaata's men; the chief surveyor therefore requested them to accompany him, in order to inform Ranghiaiaata of the circumstance. His reply was, that he had some bad men as well as good men, among his followers, and so, doubtless, had the chief surveyor; that he came there to defend his own, not to thief; but that if the white man would point out which of the Maories had taken the things, he would make him restore them, or he should have 'utu' (compensation), instead. During this time Rauperaha was most fawning and conciliatory, daily professing his great friendship for the pakeha (foreigners), and representing that Ranghiaiaata was a very brutal, rude fellow, and hostile to the pakeha. Up to this stage in the affair, Ranghiaiaata, however fierce, appeared the nobler of the two.

"As the chief surveyor's boat would not carry the effects of the party, the Chiefs made no objection to their remaining until other boats should arrive for them, or until they could be removed to one of the whaling stations at Port Underwood. Mr. Barnicoat and Mr. Parkinson preferring to remain, the chief surveyor left with Messrs. Patchett and Moline, to return to Nelson. They reached the French pass that night, and by noon on the following day had got pretty nearly to Nelson, when they observed the colonial government brig, from which a gun was fired as a signal for them to come out to her. On doing so, they learnt that the brig had just sailed, and was proceeding to the Wairau with the police magistrate (Mr. Thompson), the Company's agent (Captain Wakefield), Captain England, J.P., Mr. Cottrell, and some other gentlemen of the settlement, accompanied by the chief constable and twenty or twenty-four labouring men, who had been sworn in as special-constables. The returning boat was taken in tow, and the party, on board. The agent informed the chief surveyor that Mr. Cottrell had narrowly escaped being lost on his passage to Nelson, and had been detained on the way, waiting for the gale to subside; and that after receiving the note of which he was the bearer, and hearing his report of the circumstance, further delay had occurred before a vessel could be procured in which to proceed to the Wairau. The chief surveyor related to the agent all that had passed with the

natives whilst he remained at the Wairau; recounted Rauperaha's statement respecting his interview and appointment with the land commissioner (Mr. Spain), and his disposition still to refer the claim to the commissioner's decision; and also that Rauperaha had stated that he had not burnt Mr. Cottrell's hut until he had removed everything belonging to Mr. Cottrell; and that both chiefs had carefully avoided doing or permitting any injury, either to the persons or property of the surveyors. He represented to the agent, that the party of men on board, with those who might subsequently join them, would probably not exceed half the number of the natives then on the Wairau, if the natives resident in the vicinity should remain there; he reminded him that he (Captain Wakefield) warned Ranghiaiaata, in reply to his threat uttered at Nelson, that he would take several hundred men to arrest him; and he strongly urged, that however confident they might feel of the result, in the event of a conflict, that considerations of humanity to the natives demanded that their superiority in numbers should be so apparent, as to render resistance manifestly useless, and acquiescence not humiliating. He also handed to the agent the kind and judicious letter which Mr. Ironside had sent to him, when on his way to the Wairau.* Captain Wakefield expressed himself most gratified with the sentiments and counsel conveyed in Mr. Ironside's letter, and quite satisfied with the departure of the chief surveyor from the Wairau, under the circumstances; as also with the reasons which he had adduced against proceeding thither to attempt to carry into effect with so small a party, the intention with which they had embarked, especially after the intelligence which had transpired, and the vacating of the ground by the surveyors. Captain Wakefield went into the cabin to the police magistrate, and requested him to read Mr. Ironside's letter, stating that from that and the other considerations urged by the chief surveyor, he had come to the conclusion that it would be better at once to return to Nelson. Mr. Thompson urged, in reply, that they should be laughed at if they returned, and that it was very important not to lose the opportunity of giving to the natives a 'prestige for the law,' and to the government an 'initiative' in the right mode of dealing with such fellows, expressing his conviction, that if the authorities at Wellington had so acted, all annoyance from Ranghiaiaata or other natives would have long since ceased. Another of the party, a gentleman who filled the office or had the title of crown prosecutor, begged that the expedition might not be given up, saying, 'It is only a lark; do let us go on,' meaning that he regarded it as a pleasant excursion, not likely to be attended with any serious consequences. The agent yielded to their wishes, and it was determined to proceed. The chief surveyor, apprehending very disastrous results would ensue, earnestly remonstrated with

the police magistrate, especially on the ground of the impropriety of his proceeding to execute his warrant or summons with an armed force. The police magistrate admitted that such an act on his part would be highly improper, and warmly complained of it as an injurious imputation, to assume that he could be capable of doing so. He explained that he did not know that he should land the men; certainly, he should not give out the arms or take the men into the presence of the natives, until he had first addressed them, accompanied only by the chief constable and interpreter, adding, that if (which he did not anticipate), the chiefs should refuse to obey his summons to come on board the brig with him, that the charge against them might be *there* investigated, he should then return to the party, and decide whether or not to use coercion. Notwithstanding this declaration, on arriving off the mouth of the Wairau, the men and the boxes containing ~~fire~~-arms were landed the same evening.

"The next morning, the whole party were ordered to get ready to proceed up the plain. The natives had left the old pah at the mouth of the river, on seeing the brig approaching, and were reported to be in a wood about five miles inland, and on the bank of the river. Perceiving that the police magistrate would not go to them unaccompanied by the force which he had brought, the chief surveyor addressed himself to the agent, and offered to go in his place, accompanied only by the chief constable and interpreter, if the police magistrate would allow the force to remain. The agent gladly accepted the offer, and easily persuaded the police magistrate to acquiesce. The chief constable was ordered to get ready. Presently he came forward, with a cutlass at his side, a brace of pistols, and a pair of handcuffs in his belt, and a pair of leg irons in his hand. The chief surveyor called attention to these accoutrements, expressing his conviction that the sight of the irons would exceedingly exasperate the chiefs and all the natives. He therefore requested that they might be left behind, and that if the constable wished to carry pistols, at least they should be concealed, so as to convey no appearance of an attempt at intimidation. On this, the police magistrate ordered the constable to put away the irons, and immediately added, that the whole party should proceed together, as he had, in the first instance, directed. To this determination he fixedly adhered. First, it was attempted to go up the river in boats, but it being ebb tide, and the wind not favourable, the boats, when filled, could make little way against the current. The men, therefore, landed, excepting Mr. Cotterell and his hands, who remained in a whale-boat. Much time was lost ere the party started: the track along the river (a survey line) afforded bad walking; the excitement of the excursion had been damped by the night's bivouac and the cold air of the morning; and it was evident that

* The letter of the Rev. Samuel Ironside, dated June 12, 1843, addressed to Mr. Tuckett, and delivered to him on his way to the Wairau, expressed great anxiety lest a collision should arise out of the subject of the claims to land, which would eventually terminate in the extinction of the native tribes, as had been the case in other countries settled by Europeans. Mr. Ironside urged on Mr. Tuckett not to be precipitate in endeavouring to include the Wairau in the Nelson survey, adding, that "the

natives were almost fighting amongst themselves about the land, and that the resident natives felt themselves greatly aggrieved, because, as fast as Puaha and his party cleared the land, Rauperaha and his party took possession of it; in consequence of which procedure on Rauperaha's part, Puaha had expressed an intention to withdraw with his people from the Wairau, and to treat with the Nelson agent for the sale of it.'

the illusion of its being a pleasure party had vanished. They made but very slow progress. Going along, the agent alluded to the natives as not being a fighting people, but, on the contrary, a trading people, and expressed his conviction that they would not fight; the chief surveyor told him that he was convinced they would fight, if the police magistrate, by force, attempted to arrest the chiefs. On their way, they met with Puaha and his people, who were on the bank of the river, near to their canoes, having separated from the natives of the Northern Island, and being on their way to return to Port Underwood, quitting the Wairau (as had been foreseen by Mr. Ironside). Their countenances bespoke much alarm and grief, especially that of Puaha; so much so, that the agent made some remark at the time about it; and again, during the night, alluded to it as having painfully impressed him. The police magistrate assured Puaha that he had not come to interfere with him, and explained that he had granted a warrant against Rauperaha and Ranghiaia, because they had burnt Mr. Cotterell's hut. He inquired where those two chiefs were; and on being informed that they were further in the interior, he requested Puaha to go and inform them for what object he had come. Puaha, at first, declined; but at last reluctantly undertook to bear the message: but he advised and entreated the police magistrate not to take the armed men with him when he went with the Queen's warrant, otherwise nothing which he, Puaha, could say, would make them believe that the police magistrate was not come to fight with them. Puaha then left on foot, his people following in their canoes up the river. The party from Nelson soon crossed the stream, and took up their position, until morning, in the wood already mentioned, about five miles from the mouth of the river, where the natives had been encamped the previous night. That evening the police magistrate frequently expressed his fear that he should not have the opportunity of arresting the chiefs, professing to believe that as soon as Puaha got to them, they would disperse in great panic, and had probably already got out of the Wairau. The resident agent, always grave and somewhat reserved, became unusually so, and in the opinion of a survivor, entertained a deep foreboding that the morrow's work would prove an unfit theme for heartless or feigned levity. The deep gloom which had fallen on the countenance of Puaha, and his prediction of the consequences of their persisting in their mode of procedure, evidently troubled him, for he recurred to it on awaking during the night. It was observed, in explanation, that there must necessarily have been a great struggle in the mind of Puaha, whether he, a chief, and once a warrior, should show himself to be faithful to his relatives and elders in the coming crisis, or stand aloof in fidelity to his Christian convictions of the sinfulness of shedding man's blood. To this remark Captain Wakefield assented, with an expression of respect for Puaha. The following morning, the camp of the natives was easily distinguished at a distance of about two miles, by the smoke of their fires. It was in a strong position, affording particular facilities for retreat, should it be desirable, through a thickly-wooded valley, leading to Queen Charlotte's Sound. The Nelson party being mustered, and sixteen to eighteen rounds of ball cartridge served to each man, proceeded on their way. They numbered forty men, bearing muskets, bayonets, and cutlasses, besides ten to twelve

gentlemen, apparently unarmed, of whom two, Mr. Cotterell and the chief surveyor, were really so, in accordance with their principles and practice. On approaching the native camp, a deep, narrow, canal-like stream intervened, called the *Tua Marina*, or still-water. The natives were on a little grassy plot, surrounded by bushes, with but few timber-trees. On the bank where the colonists halted, the trees were numerous and large: it was the wooded slope of a hill-ridge which separated this valley from the plain, forming the western boundary of the latter. The stream was there not a hundred yards from the hill-ridge, which, as well as the slope on the other side, was unwooded.

"As soon as the armed force became visible to the natives opposite, they hailed it, inquiring loudly if they came to fight. The police magistrate replied that they did not, and explaining his purpose, requested the natives to place a canoe across the stream, that he might pass over to them. They replied, that they would not permit the armed men to cross, but that the gentlemen might come alone, if they were so disposed. This offer was accepted, a canoe was laid across, and the police magistrate, having left the armed men under the command of Captain England and Mr. Howard, to act if called on to do so, went over, accompanied by the agent, the chief surveyor, Mr. Cotterell, Mr. Patchett, the chief constable, and the interpreter. The canoe was then withdrawn, and laid as before alongside the stream by the natives. Three women,* the wives of Rauperaha, Ranghiaia, and Puaha, sat in the centre; the party of the resident natives on one side, and the armed natives of the Northern Island on the other side of the group. Puaha stood in the centre, with a Testament in his hand, reading to the natives, and exhorting both parties to peace. Ranghiaia was in the background, out of sight. Rauperaha advanced, unarmed, to meet the police magistrate and his companions, and inquired his object in coming there. The police magistrate informed him of the charge on which he had issued a warrant, and required him and Ranghiaia to come on board the brig, where he would investigate the charge. Rauperaha replied by denying the accusation; explained that he had had everything belonging to Mr. Cotterell and his party removed before he ordered his people to set fire to the wood and grass which formed the sides, and supported the sail-cloth covering of the hut; that he had not burnt anything but that which had been taken from his own land. He appealed to Mr. Cotterell, who admitted the truth of his statement. The police magistrate remarked that he would not there discuss the matter, but that the two chiefs must obey the warrant, and go on board the brig, where he would listen to both sides, and decide the case fairly and impartially. Rauperaha replied that he would not go on board the brig, and so place himself in the power of the police magistrate, but that he would let him judge the case there, and though he considered himself to be the injured party, yet, rather than there should be any fighting, if a 'utu' or compensation were required, provided it were not excessive, he would comply. The police magistrate still insisted on their going on board the brig, adding that they might be accompanied by their men, if they wished it. He desired the interpreter to put it to him

* The presence of women is an invariable demonstration of the peaceful intention of the Maories.

whether he would go or not. Rauperaha, with much firmness, replied that he would not; on which the police magistrate, pointing to the opposite side of the stream, exclaimed, 'then tell him there are the armed party; they shall fire on them all.' A stranger native from the Bay of Islands, who understood the English language, told the armed natives that an order to fire had been given, upon which they sprung to their feet, levelled their muskets at the police magistrate and his companions, and stood waiting the order from Rauperaha to fire. Mr. Patchett and the chief surveyor approached and assured them that only a threat had been uttered, not an order to fire. They then resumed their former posture, squatting on the ground. Presently, Rauperaha persisting in his refusal, the police magistrate repeated his threat, and at the call of the stranger native, the armed natives again sprung to their feet, and levelled their muskets as before. At this moment Ranghiaia left his concealment, and rushed forward, menacing the police magistrate with his hatchet. Mr. Patchett exclaimed to the chief surveyor, 'do interfere, or we shall be all murdered;' the latter, addressing the agent, remarked that being completely in the power of the natives, in consequence of the separation interposed by the stream, it was desirable that they should immediately return to their party on the other side, before, from the uncontrollable passion of Ranghiaia, it should be too late to do so. Puaha came forward at the same time to learn what was being suggested. The agent approved the proposed step, and Puaha, in answer to his request for permission, desired him to take the canoe and pass over, in spite of the vehement opposition of the stranger native, who urged that as soon as the English had joined their party, they would fire. The agent, taking a pole, stepped into one end of the canoe, desiring the chief surveyor to remain on the bank, and move the other down the stream, until he could bring his end to a convenient landing, at a place free from thicket. Having accomplished this, he stepped out on the bank where the armed party stood, and addressed them with, 'men forward! Englishmen forward!' Several of them sprang into the canoe to cross over to the natives, while the police magistrate and the others entered it from the opposite bank. A momentary confusion and stoppage took place, and the canoe was nearly capsized; during this time a gun was discharged on the side occupied by the colonists (it is believed by a man accidentally falling). The natives instantly fired on the armed English in the canoe, killing the two foremost, and their fire was at once returned from the opposite bank, and then kept up on both sides. In the midst of this fire the police magistrate and the other gentlemen passed over the stream unhurt. The natives must have purposely abstained from shooting them, from a principle of honour, believing them unarmed, for they could have touched some of the hindmost with the muzzles of their muskets. The chief surveyor, when all the rest of his party had passed him in the canoe, entered the water, and with the aid of one hand, on the canoe, reached the opposite bank, the last of those who had crossed to the side on which the natives were; he then stood, as he supposes, about ten minutes exposed to the native fire, at a distance of perhaps twenty yards, whilst some fourteen or fifteen of the armed labourers returned it steadily and rapidly. His friend, Mr. Patchett, Mr. Barnicoat, and Mr. Cotterell, stood near him, as did also the chief constable. Mr.

Patchett and the constable were both shot, the former mortally; two or three of the labouring men fell there, whilst others received wounds. Meanwhile, the leaders of the expedition were not in sight, having retreated from the borders of the stream to the foot of the ridge, accompanied by Captain England, Mr. Howard, and the majority of the armed men; they had doubtless retired to consult on what course to pursue, for shortly one of them hailed the chief surveyor by name, telling him that they were going up the hill, and desiring him to come away with the rest of the men, who had till then effectually prevented the natives from crossing the stream. The instant that they turned to leave the ground, the natives, carrying their muskets high with one hand, dashed through the water, took possession of the position just vacated, and from thence, under cover of the trees, fired on the retreating men, exposed to their aim as they proceeded up the bare ridge of the hill, outside the skirts of the wood, following their party in their precipitate retreat. On overtaking them at the first headland of the rise, they found the agent calling on the men to form and charge; the majority of those who had first proceeded up the hill continued their ascent, but more than a third stood with the gentlemen of the party; the natives meanwhile taking aim at a short distance from behind the trees. One of the armed men (who had been in the artillery), told the agent, that there was no one to be seen to charge on, and that it was folly to stay there to be shot down like crows by the natives, who had got possession of the wood; so saying he strode away. The opinion was right; the agent followed his example, and advanced with those who remained further up the hill. Having gained a distance at which the native fire ceased to be very dangerous, he determined to attempt a negotiation. Captain England and Mr. Howard consented to return towards the wood, carrying a white handkerchief on a stick, as a flag of truce. The agent, the better to ensure their safety, that the natives might understand the intention, desired all who remained to disarm, and lay down on the ground. This done, Captain England and Mr. Howard approached the wood; the natives left off firing, and some of them putting aside their arms, came out to meet them: but the larger party of the colonists who, when the retreat was so unwisely determined on, seized with some degree of panic, had continued to ascend the hill, regardless of the subsequent order to form, now seeing the rest of their party on the ground, halted on the summit of the hill, and commenced firing at the natives, who, confiding in the flag of truce, had come out of the wood. On this seeming treachery, the natives retreated hastily to the wood and resumed their arms, Captain England and Mr. Howard ran back up the hill to their companions, and reached them, untouched by the renewed fire of the natives: upon which the police magistrate and his companions sprung to their feet. Most of the party evinced great self-possession, but no orders were given, and most of the men did not resume their arms; they commenced walking up the hill, which the others on the summit perceiving, immediately continued their retreat. Some went off into the wooded valley on their left; but the greater number went forward up the ridge. As they moved away, the chief surveyor, who had lain on the ground between the police magistrate and the agent, stood still, and addressing the party, urged that they should descend to the plain on the right

hand, believing that they could not easily reach the coast in pursuing the ridge. He repeated this suggestion twice, but no one replied to it, nor acted on it; then, as all had left the ground, he started off, descending obliquely into the plain, in the course which he had recommended, calling on Mr. Barnicoat by name to come with him, which he did. One of the labouring men, named Gay, also turned off after him; Mr. Cotterell stopped for a moment as if about to do so likewise, but presently followed the others in their retreat up the hill.

"The moment the natives perceived that the retreat was resumed they proceeded up the hill, and on arriving at the point where the chief surveyor had left the ridge, five armed natives followed on his track, firing as fast as they could, whilst the larger number ascended the ridge after the main body of fugitives. Puaha hastened up the hill, and called back the five natives from the pursuit of the chief surveyor and the two who accompanied him. Soon after the chief surveyor observed Mr. Cotterell turn back, and meeting the natives surrender himself, and saw the rest of the gentlemen of the Nelson party overtaken and surrounded before they had arrived at the further summit of the hill.

"At the first commencement of this most ill-advised retreat from the wood at the foot of the hill, a merchant from Sydney, who was a passenger in the brig, on her calling at Nelson, and who had accompanied the Nelson colonists up the Wairau in the expectation of having a pleasant excursion, returned to the boats with one of the armed men who had been disabled by an extremely painful wound of the hand, taking the whale boat, and the man who had charge of the boats; these three, leaving the large boat, descended the river, and gained the brig. A few others, at the same time, retreated by another route, going inland up the Wairau valley, and thus back to Nelson. Before the chief surveyor and his two companions reached the coast, they were joined by seven or eight others who had descended from the hill into the plain, and seeing them coming, waited their arrival. One of these had received a severe wound in the shoulder, which bled profusely, but which he bore with great fortitude. The chief surveyor proposed their dividing into two parties, one to go to the pah at the mouth of the river, the other to the shore at the west boundary of the plain, and thence along the coast towards Port Underwood, thinking that thus there would be greater probability of some of the party gaining the brig. He desired whoever should first do so to tell the captain that his immediate departure for Wellington would afford the best protection for those who were or might be in the power of the natives. The men, however, refusing to separate, he determined to gain the sea shore on the side nearest to Port Underwood. On reaching it, at that very point, they found the crew of a whale boat fishing and watching for whales. Very reluctantly, and after urging strong objections, the head man of the boat consented to receive the whole party, ten or eleven in number, and to convey them on board the brig, distant seven or nine miles, a heavy swell setting in shore on the boat's beam the whole way. Even after having made the promise, he declared that he must turn back, and take them to Port Underwood, or all would be drowned. Fortunately, when his resolution was at a low ebb, a rival whale-boat came out in rapid pursuit, imagining that the one in advance was in chase of a whale. The idea of the mis-

take of their pursuer took the crew's fancy, all thought of danger vanished, and before the other boat could approach them near enough to perceive their mistake, it was as well to proceed to the vessel as to return. As soon as the colonists were on board the brig the whalers were informed that the party from Nelson had retreated from the natives, into whose hands the leaders had fallen, and that the others had dispersed in various directions. The chief surveyor obtained from them a promise (which however was not fulfilled) that they would return to Port Underwood, and acquaint the rest of the Europeans with the circumstance, that they might consider what was best to be done for the safety of all, and what measures to adopt for the relief of those who had dispersed. The ship's boats were sent out along shore to pick up any stragglers who might arrive at the beach. Soon after sun-set a great fire was seen flaming on shore near the old pah, at the mouth of the river: it was important but very difficult to ascertain whether it was made by the natives or by the fugitives, since there was great danger at dusk on account of the bad bar and the surf, beside the probability of the natives being there. A boat which was sent to reconnoitre returned not quite certain who was on shore, but believing that it was a party of natives, as it afterwards proved to be. The captain of the brig at first inclined to enter Port Underwood, but on being urged by the chief surveyor to cross to Port Nicholson, he acquiesced, and before day-break next morning landed him at Wellington. The wounded men were landed and left; one of them had to undergo immediate amputation of his arm at the socket-joint of the shoulder. Great excitement was produced there both amongst the colonists and natives by the news of what had taken place, a large party of volunteers at once embarked, to go over for the forcible rescue of the Nelson colonists; but a gale of wind came on which prevented the brig sailing, and made the volunteers sea-sick and discontented, and better counsels prevailed. The volunteers re-landed, and the principal agent (Colonel Wakefield), the land commissioner and his interpreter (Mr. Meurant), the Protector of Aborigines, with some magistrates and surgeons of the settlement embarked, convinced that if those who had been taken were yet alive, their liberation would be more easily and safely effected by the negotiation of their friends, than by an attack, or threats of armed interference. The brig resailed in the night. On arriving at Port Underwood, the Wellington gentlemen, who were apparently almost without apprehension respecting the safety of their countrymen, received the appalling intelligence that all who had surrendered had almost immediately perished, and that the natives had then precipitately left the Wairau, taking with them the large boat as well as their canoes; that they had held a council at the mouth of the river, some wishing to attack the brig, whilst others objected to doing so. They then quitted the river for Port Underwood, and had gone thence intending to return to the Northern Island, accompanied by most of the resident natives, who were all in consternation at what had been done, anticipating that it would be revenged. Of the colonists who had escaped, the most part had found their way to Port Underwood, some of whom had suffered much from wounds, and also from protracted hunger. Mr. Ironside, the Wesleyan missionary at Port Underwood, had proceeded to the field of combat, as soon as the afflicting tidings reached him, accompanied in

his boat by a few attached natives. He entered the Wairau river when the state of the weather would have deterred others less habituated in self-sacrifice. Mr. Spain the land-commissioner, immediately engaged whale-boats and crews to proceed with the party on board the brig, to the assistance of Mr. Ironside, but the boatmen could not be induced to attempt to enter the river, until the weather had moderated. Colonel Wakefield, the brother of the deceased resident agent, having intimated that it would be satisfactory to him if the bodies were interred on the spot, and all feeling that the removal by boats, and then by the brig to either of the settlements, could not be easily accomplished, as soon as the weather permitted, the party entered the Wairau, intending to inter them there. But it was already Saturday, and Mr. Ironside could not remain longer absent from his station, both on account of his other duties, and for want of provisions; therefore having seen the brig returning from Wellington, and receiving no assistance or message in the ensuing two days, he had been compelled, unassisted, to prepare the graves, and commit to them the bodies of the slain, and had already nearly completed the painful and fatiguing service before the arrival of the party from the brig. But afterwards, on extending the search, two more bodies, probably of some who had crawled away mortally wounded, or of fugitives who had been overtaken, were found and buried. Those who fell in the combat in the wood, five in number, were interred there, and those who were killed on the hill after their surrender (fourteen) were interred close by.

"Mr. Ironside found that the bodies had not been in any way mutilated, neither had their clothes nor their personal property been interfered with. The watch of the agent was the only article missing: it appeared to have been snatched from his person; the guard-chain was broken, but remained under his vest; and the watch had probably been drawn out unintentionally, and fallen to the ground, in a struggle for life. One of his pistols, the cap of which had missed fire, was laid across his throat. It appears that he was the only one of the party who attempted to defend himself.

"Returning to Port Underwood, Mr. Spain obtained information of property belonging to the slain, which had been sold or given away by the natives, who, in descending the river, had taken possession of much property belonging to the deceased, which had been left at their last sleeping-place in the wood. Two young native men were found, who had been present in the conflict at Wairau, and being wounded there, had remained at Port Underwood with female relatives connected with the whalers. Their depositions were taken the next morning by Mr. Spain, and the other magistrates, on board the brig. They concurred in representing, that as soon as the gentlemen were overtaken, Puaha, who was one of the first to approach them, offered them his hand, telling them he had counted the dead, and that the number was the same on each side; that, therefore, there was no need (even according to Maori usage) of any further bloodshed. That Rauperaha, on coming up, also acquiesced in Puaha's sentiments and assurances, only requiring a large payment in satisfaction for the injury which had been done to him and his people. At this moment, Ranghiaiaata had rushed up furiously enraged, and demanded the lives of the whole party, to avenge the death of his wife, bidding Rauperaha remember his

daughter. Rauperaha appears to have admitted this claim, and Puaha, and the resident natives to have been intimidated by the armed followers of the heathen chiefs of the Northern Island. The native witnesses further stated, that Ranghiaiaata almost immediately killed the lamented colonists with his own hand, though it is probable that others of his followers must have assisted in the merciless slaughter.*

"All information having been obtained that could be had, the party prepared to return to Wellington, taking with them the wounded. Those of the Nelson party who had escaped uninjured, left for that settlement, some preferring to return overland, the rest proceeding in two whale-boats. Before parting, the principal agent handed to the chief surveyor an official letter, appointing him to the office of acting agent for the settlement, until the pleasure of the directors of the New Zealand Company should be known.

"The body of Mr. Maling, the chief constable, not having been found, and others who were missing not arriving at the settlement of Nelson, which it was hoped they might have reached subsequently, Mr. Ironside kindly returned to the graves, both to have them protected by some enclosure, against disturbance by pigs, and to search further, if any bodies should remain uninterred. He was successful in finding two bodies—those of the men who entered the canoe on the order being given for them to cross the stream, and who fell in the water on the first fire from the natives. The bodies, which at first sunk, had subsequently risen to the surface. The chief surveyor, on leaving the brig, though the weather threatened to be very bad, determined to go up Cook's Straits, outside all land, lest his return to Nelson should be interrupted by the natives in Tory Channel, or Queen Charlotte's Sound, the party in the other boat, though directed to keep company, went into Tory Channel, and were detained by the natives for a week. The wind was fair, but about sunset it blew a gale, accompanied with heavy rain. Running with the smallest possible sail before the gale, the French Pass was reached in unusually short time. The sky clearing a little, a new danger presented itself. They could distinguish the Deal boat which the natives had taken possession of in the Wairau, entering the Pass close in on the opposite shore. The whale-boat not being easily distinguishable within the same distance, the boat was beached, and a short stay made, to permit the boat on the opposite shore to pass the narrows of the straits. Then launching it again, and passing through the rapids, keeping as close as possible in shore, they gained the further entrance of the Pass on the side of Blind Bay, just as the Deal boat was being hauled up on the beach of a little bay on D'Urville's Island, by a large party of men apparently all in dark European clothing, or else having their bodies blackened. However, the whale-boat either passed unobserved, or else the natives did not care to encounter, in the night, the very heavy sea which was then rolling into the Pass, and in about sixteen hours after leaving the brig, the colonists arrived in safety at Nelson Haven.

* *Vide* the evidence of these witnesses, which was penned before the magistrates, in the brig, by a Mr. Marshall, now residing at Plymouth, who, with a Captain Wilson, of Nelson, were on board the brig on her departure from Nelson, and who remained on board when the others landed at the Wairau.

"It would be impossible to describe the consternation which prevailed when the result of the expedition to the Wairau was first communicated there, on the arrival of the chief surveyor. The disorganization which ensued amongst all classes, has been the subject of many official and other statements, and will not here be pursued in the sequence of its details. But as the unsound state of the settlement, in respect to the want of employers and the excessive number of disappointed* emigrants of the labouring class, has been already portrayed, it may be necessary here to state, that all this evil was at once aggravated, the few private persons who had hitherto employed labour immediately diminishing or ceasing entirely the employment of labourers. All, consequently, came on the Company for employment; the number of claimants rose rapidly, in spite of impediments or delay, from 250 to 400. The inadequate performance of work by the men having always been known to the acting agent, in his capacity of surveyor and engineer, he could not conscientiously continue the former practice of paying them wages, unless they would earn them. This intimation produced resentment and resistance, which was secretly aggravated and kept alive by those tradesmen who were momentarily interested in a wasteful expenditure, and by the jealousy of others, although their true interests, like those of the settlement, depended on the improved industry of the labourers. The natives, in general, became the objects of fear, insult, and bad feeling; and the acting agent, in doing only impartial justice to their conduct and claims, largely shared in that expression of ill will. After much disorder from these causes, and alarm from unfounded reports of the intended attacks on the settlement by Rauperaha and Ranghihiata, and consequent unnecessary disposition of labour for the defence of the town, got up for the most part to keep the mass of the discontented labourers there, and so baffle the attempt of the acting agent to employ them in various districts more effectively; some degree of order and industry was at last restored, by the consent of the principal agent to the employment of the men, in future, by piece-work, which Colonel Wakefield would not permit, when first proposed to him by the acting agent, though he allowed his successor, Mr. Fox, to carry the suggestion into effect. At the same time, the men, feeling that the reputation of the settlement would fall in England on receipt of the intelligence of the disastrous loss at the Wairau, began to perceive that it would be wise to do some work on the land, so that if the worst came, they might have some food of their own raising for subsistence. They, therefore, generally consented, one set after another, to take land of the New Zealand Company, provided that it was *good* land, and that the labour by piece-work, in forming roads, was allotted them *near to such land*. By this arrangement, many hundred men became cottiers in a settlement, in

which the land was purchased by the proprietors on the condition that the men should be, as much as possible, prevented from becoming cottiers. It would have been only tardy and partial justice to the deceived labourers, if such an arrangement had been effected earlier. Under the circumstances, it was an unavoidable and irretrievable injury to the few proprietors who had employed labour in land, hoping to obtain a remunerating market for its produce. These, it must be clear, are equitably entitled to a liberal compensation, both for their purchase and for their expenditure of capital in the improvement of the land, as are all the *non-resident* proprietors, to the return of the purchase price of the land, with interest thereon. The land possessed and occupied by the proprietors was necessarily for the most part very inferior in quality, because the allotted district afforded very little fertile land, and *their* order of choice had been determined in London by the action of a lottery. But the labourers who were induced to become cottiers, in order to relieve the New Zealand Company from the obligation of maintaining them, selected the best portions of the best sections of lands, which the reserved land of the New Zealand Company, or that kept for sale in the colonies, would afford. With the assistance of the land commissioner, or even without it, *prior to survey*, the lands required might have been purchased *seriatim*, on the most reasonable terms, as fast as they were required. But the New Zealand Company insisted on surveying and occupying first, and determining their title afterwards. The completion of the survey of the Nelson settlement was stopped, the local government sending a notice to the chief surveyor that he was not at liberty to enter the Wairau, until the purchase should be completed."

It was not at Nelson, only, that the effects of the melancholy Wairau catastrophe were experienced; on the contrary, the shock it caused reverberated through the length and breadth of the land, but was especially felt in the vicinity of the Company's settlements. Mr. Commissioner Spain, writing two years afterwards, declared that this unhappy conflict had done much towards the estrangement of the two races, and that from the period of its occurrence, might be dated the existence in the native mind of a feeling of jealousy and animosity towards the European stranger, but little calculated to strengthen the bonds of intercourse between them, or to promote the advancement of civilization.† The handcuffs and leg-irons which Mr. Thompson

* The number of emigrants sent out by the New Zealand Company to Nelson, was, in—

1841—77, belonging to the preliminary expedition.

1842—403, arrived before September, guaranteed "employment in the service of the Company," when "unable to obtain it elsewhere."

— 231, arrived after September, not having any promise of employment from New Zealand Company.

1843—96, without promise of employment from New Zealand Company.

Total, 789. Certified by immigration agent. Nelson, 28th July, 1843.

There was no employment for the greater part of these immigrants, and it was therefore incumbent on the Company to employ or otherwise support them.

† Parliamentary Papers, New Zealand, 8th April, 1846, page 17.

had so unwisely taken with him, when about to attempt the forcible capture of Rauperaha, and Ranghiaiaata having fallen into the hands of the natives, were sent throughout the Northern Island, from tribe to tribe,* as evidence of what the encroaching foreigners, who had at first been supposed to be Christian colonists and peaceful traders, intended to do to the Maories, by-and-bye, when they should become sufficiently powerful. It was then that the marked alteration took place in the tone and bearing of the natives, consequent upon the illegal encroachments of the New Zealand Company's settlers, who wished to make it appear that they (the natives) were striving to retain possession of lands which they had willingly alienated, which there is abundant evidence to prove was not the case.

The Wellington and Nelson colonists, after the Wairau affray, spoke and acted as if their unhappy countrymen had been the victims of an unprovoked, savage, and murderous attack upon them. They rose *en masse*, made the most hostile speeches regarding the natives, which they followed up by every warlike demonstration—drilling, exercising, constructing batteries, and practising themselves in the working of cannon.†

Acting-Governor Shortland, perceiving the necessity of taking some step to quiet the excitement of the population, both British and Maori, sent Major Richmond, with fifty-three men, (more than half the force at his disposal,) to maintain peace in the settlements on Cook's Straits, with orders for the immediate discontinuance of the irregular military preparations then actively carried on. The acting-governor, at the same time, issued a proclamation, warning all persons against exercising acts of ownership on land, to which their title was disputed by the original native owners, until the question of ownership should have been determined by the said commissioners. He likewise consulted Mr. Swainson, the attorney-

general of the colony concerning the legality or illegality of the proceeding of Mr. Thompson. Mr. Swainson at once declared it to have been "illegal in its inception, and in every step of its execution; unjustifiable in the magistrate and the four constables, and criminal in the last degree on the part of the rest of the attacking party." He also gave it as his opinion, (after receiving the depositions of various witnesses of both races,) that no act of felony had been committed by the chiefs, and that it was difficult to conceive on what legal grounds a warrant could have been issued for their apprehension.‡

The attorney-general's opinion was confirmed by that of Mr. Spain, her Majesty's land commissioner, also a lawyer, who, in a letter to the acting-governor, dated Port Nicholson, 28th June, 1843, says that this—

"Ill-advised and injudicious step was an attempt to set British law at defiance, and to obtain, by force,§ possession of a tract of land, the title to which was disputed, and then under the consideration of a commissioner specially appointed to investigate and report upon it."

He adds—

"All the information I have obtained goes to show, that in the commencement of the affair, the natives exhibited the greatest possible forbearance, and evinced the utmost repugnance to fight with the Europeans, requesting that the matter might be referred to me for decision, they not understanding any difference between the land question and the offence of burning the 'toe-toc' hut upon the land which they claimed as their own."||

Mr. Clarke, the protector of aborigines, thus expressed his view of the subject:—

"I cannot say I am surprised at what has taken place; I rather wonder at the long forbearance of the natives in the vicinity of the Company's settlements, receiving, as they have, such deep provocation, in the forcible occupancy of lands which they never alienated. * * * I am satisfied that such an unhappy affair as that of Te Wairau, could never have occurred, had not the natives been urged to it by extreme provocation. * * * The parties engaged in this rash and inhuman affray have inflicted a deadly wound on the interests of the colony, by means of the unfortunate impression with regard to native character which this circumstance, even after

* Intelligence is rapidly transmitted throughout New Zealand, whether the tribes are at war or at peace. Every traveller is expected to bring news to ensure his welcome; and as may be supposed, the Maories, like most other inveterate gossips, occasionally draw upon their imagination for their facts.

† Vide an able essay on the *British Colonization of New Zealand*; published by the committee of the Aborigines' Protection Society; 1846: p. 18.

‡ Appendix to Report of Select Committee for 1844; pp. 165 and 177.

§ That the expectation of Captain Wakefield was to

obtain forcible possession of a disputed tract, is evident from a letter addressed by him to his brother, Colonel Wakefield, dated Nelson, 13th June, 1843, in which, after mentioning that Thompson, himself, England, and a lot of constables, were off immediately, in the government brig, to execute the warrant, he adds, "*we shall muster about sixty; so I think we shall overcome these travelling bullocks*" (referring to the non-resident natives).—See Mr. E. J. Wakefield's *Adventure in New Zealand*, vol. ii., p. 385.

|| Appendix to Report of Select Committee for 1844; p. 170.

the fullest explanation, will create. They have also occasioned a breach of that confidence hitherto existing, which must prove alike injurious to both parties, and which time only will repair; and while I entertain the fullest confidence in the integrity of the natives, and am under no apprehension of any undue advantage being taken by them of their late success,* I at the same time, experience the greatest apprehension of danger from a number of our own countrymen, who, I fear, are using every possible means to widen the breach, for the unworthy purpose of *taking possession of the coveted lands, and throwing the onus of the aggression on her Majesty's government.*"

Mr. Shortland acted in accordance with the opinions of the three gentlemen referred to, and thereby rendered himself extremely unpopular with the Wellington and Nelson settlers, who, though prevented from continuing in public their warlike demonstrations, "began to practise rifle-shooting in their own gardens, and kept stands of arms and ammunition always ready in their houses," a proceeding which did not escape the observant natives.

Captain Sir Everard Home, Bart., arrived at Port Nicholson in the month of October, in command of H.M.S. *North Star*, and was immediately appealed to by the excited colonists to execute a warrant against Raupehaha and Ranghiaiaia for murder. He assured them that they had entirely mistaken his functions as captain of a man-of-war, and explained that troops had been put on board, on the express condition that they were on no account to be landed, except for the preservation of the lives and properties of British subjects. Sir Everard, on reaching Auckland, informed the acting-governor that, in his opinion, none of the settlements which he had lately visited had anything to fear from the natives, *so long as they (the natives) were fairly dealt with.*† At Nelson, he adds, "a force is wanted, not to repel the attacks of natives, but to restrain and keep in subjection the English labourers brought over by the New Zealand Company, who have, I believe, been in open rebellion against their employers more than once. At that place, also, the general feeling appears to be more inclined to revenge the death of their friends, than to wish impartial justice to be done; and vengeance and revenge are words that I have heard used when speaking of that affair."‡

* Fears were then entertained, both at Wellington and at Nelson, that the natives intended to attack those settlements, and massacre the residents, in revenge for their own people who had been slain at the Wairau.

Governor Fitz-Roy arrived at Auckland at the close of December, and found the local government without money or credit, and in debt more than one year's revenue. There were no means of paying any salaries, however long in arrear; scarcely could the most pressing and ordinary payments on account of the colonial government be made. Various local laws, urgently required on account of frequent disputes which occurred between settlers and natives, to whose condition English law is more or less unsuitable, had been too long deferred, the Legislative Council not having been assembled during Mr. Shortland's administration of the government, or for nearly a year previous to Captain Hobson's death, during which long interval no measure had even been prepared by the law officers. The complimentary addresses to the new governor from the various settlements, all teemed with expressions of distress and dissatisfaction. The inhabitants of Auckland, through their chairman, Dr. S. M. D. Martin, after congratulating Governor Fitz-Roy on the safe arrival of himself and his family, gave a painful picture of the state of the settlements, and adverted to "the bankruptcy of the local government, the great amount of its debts in a community so small, with the vast amount of privation and misery necessarily occasioned; the suspension of the land sales, as well as of emigration; the total destruction of the once flourishing commerce of the country; the state of starvation in which many of the emigrants are existing, with the complete prostration of the energies of the settlers generally, and their desire to leave the colony, unless an immediate change for the better can be brought about."§

Among the causes for this state of things especially noticed, were the non-settlement of the claims made by the old and original settlers, after the lapse of nearly four years, and the discontent widely spreading among the natives, with whom, the address goes on to state, "our relations, we believe, can never be placed upon a secure basis, until their full rights as British subjects are conceded to them; more particularly the power of selling their land to whom they please—a power which they ardently

† *Adventure in New Zealand*; by Mr. E. J. Wakefield: vol. ii., p. 418.

§ *Ibid*, 22nd April, 1845; p. 21.

desire to possess, and which their intelligence, as well as their natural rights, gives them the strongest claim to enjoy.* The restrictions on trade by custom-house regulations and duties, were bitterly complained of, and the want of punctuality in the payment of salaries and other pecuniary obligations due by the local government, was adverted to as having occasioned much inconvenience and loss of credit to individuals, and proved hurtful to the community generally. Another grievance was "the recent importation of juvenile delinquents from the Penitentiary of Parkhurst."

The addresses from Wellington and New Plymouth breathed the same spirit of depression, mingled with alarm at the tone and manner of the natives, in regard to the land claims.

In the Kororarika address, it is stated, "the country has become, beyond example, one general scene of anxiety, distress, and ruin, so that property has lost its value, personal security has been at stake, and happiness has almost ceased to exist." The causes named are, the unsettled state of the old land claims, and the imposition of custom duties, which had driven away both native and European commerce, and destroyed all agricultural enterprise, together with the market for all sorts of produce.

Notwithstanding the pressure of business at Auckland, Governor Fitz-Roy felt the imperative necessity of hastening to the southern settlements to check the hostile feelings rapidly increasing between the two races, and effect, if possible, an amicable adjustment of the New Zealand Company's claims to land near Port Nicholson.†

The pacific and conciliatory policy he there pursued, was as sound in principle as efficient in practice, yet it met with much opposition at the time, both at Wellington and Nelson, where the feeling of animosity against the natives was very strong.

Before leaving Wellington, Governor Fitz-Roy (in accordance with his instructions) appointed Major Richmond "Superintendent of the southern division of New Zealand," with a salary of £600 a-year; he then proceeded to Nelson, which he has

described in terms wholly confirmatory of Mr. Tuckett's statements, as a very unsuitable locality for an important settlement. "Far out of the track of shipping, at the bottom of a deep bay, shut in by high wooded hills, with scarcely any level land, except at a great distance, and with a confined harbour accessible only to small ships—it is, indeed, much to be lamented, that under any circumstances, such a situation should have been selected.‡ At Waikanaë, opposite Kapite or Entry Island, the Governor, accompanied by Sir Everard Home, Mr. Commissioner Spain, and the officers of the *North Star*, the police magistrates from Wellington (Major Richmond and Mr. Symonds), and the sub-protector (Mr. George Clarke, jun.) pronounced his decision with regard to the Wairau conflict. The meeting was held in the pah or village of Te Rauperaha, in the presence of the two chiefs and a large concourse of natives, to whom Captain Fitz-Roy made a short address, telling them of the grief which the intelligence of the death of his countrymen had caused him, and desiring them to give their account of the whole affair, that he might compare it with that of the settlers, and judge accordingly.

Rauperaha obeyed, and made a clear and explicit statement, agreeing in all material points with that which has been already given (see Mr. Tuckett's narrative); he then sat down, and the whole assembly waited in silence the Governor's decision. In about half-an-hour his excellency rose, and after severely censuring the natives for their cruelty in destroying the colonists who had surrendered themselves, declared that nevertheless, as the pakehas (strangers) had brought on and began the fight, and hurried the Maories into crime by their misconduct, he would not avenge their deaths.§

By this just and discreet decision, Captain Fitz-Roy avoided the evils which must have attended any other course. Had he yielded to the clamour of the settlers, and proceeded to try the chiefs, their acquittal by an impartial jury was morally certain; and their apprehension, even supposing the English to have had the power to effect

* In a memorial presented by the committee of the Aborigines Protection Society, to Earl Grey, in February, 1847, it is urged that even were there no Treaty of Waitangi in existence, "the power of disposal is an essential element of the right of property. Property is virtually taken away when the power of disposing of it is lost."—Vide p. 7. Without entirely

assenting to the latter part of this proposition, I quote it as the opinion of a very able as well as estimable body.

† Vide *Remarks on New Zealand*, by Captain Fitz-Roy, R.N.; p. 17. ‡ *Ibid*, p. 19.

§ Parliamentary Papers on New Zealand, 1845. p. 32.

it (which they had not), could but have exasperated all parties yet more. Or had he shrunk from the responsibility, referred the decision to the home government, and kept the question open meanwhile, the state of mind in which the natives then were, leaves little doubt that they would have lost no time in attacking the settlements, before the anticipated arrival of military reinforcements. As it was, they rejoiced to find they were to be again on friendly terms with the "pakeha," readily laid aside their fears and suspicions, and resumed their ordinary avocations forthwith; while the settlers proceeded, as usual, in clearing and cultivating their allotments. Had, however, Captain Fitz-Roy waited despatches from England, before taking any decided step in the matter, he would have found himself thereby enjoined, in the event of any future exigency (for on this, Lord Stanley rightly judged, a course of policy would doubtless have already been adopted), to do as he had actually done, namely, to be guided rather by considerations of equity and prudence, than by the technical rules and forms of English law. His lordship, at the same time, declared, with respect to the melancholy incident in question, that after examining the evidence forwarded by the local government, and the statements made by the agents of the New Zealand Company, as well as by less biassed witnesses, that whether he tried the proceedings of Mr. Thompson and his followers by general principles, or by the narrower rule of the law of England, he was compelled to adopt the same conclusion, and to record, notwithstanding his regard for the memory of the deceased, his belief that *they had needlessly violated the rules of the law of England, the maxims of prudence, and the principles of justice.*

After enumerating the leading facts of the case, Lord Stanley added:—

"So manifestly illegal, unjust, and unwise were the martial array and the command to advance, that I fear the authors of that order must be held responsible for all that followed in natural and immediate sequence upon it. I know not how to devolve that responsibility on the natives; they exercised the rights of self-defence, and of mutual protection against an imminent, overwhelming and deadly danger. Revolting to our feelings as Christians,

* Appendix to Report from Select Committee of Parliament, 1844, pp. 172, '3, '4.

† "The first payment in compensation of former deficiencies made at Wellington, in February, 1844, consisted of £730, and was paid over all in silver

and to our opinions as members of a civilized state, as was the ultimate massacre, it is impossible to deny to our savage antagonists the benefits of the apology which is to be urged in their behalf.

"They who provoke an indefensible warfare with barbarous tribes are hardly entitled to complain of the barbarities inseparable from such contests; and even in a state of society far advanced above that of the New Zealanders, some indulgence must be made for the fierce working of the vindictive passions of our nature at the moment, and on the scene of battle, when kindled by such provocation as the violent death of a wife and daughter protecting her husband's person at the sacrifice of her own. * * * In conclusion, I have only to express the earnest hope I entertain, that by a conduct towards the natives, distinguished alike by conciliation, sincerity, and firmness, it may be in the power of the governor to re-establish that confidence in the justice, and that respect for the strength of the local government, which the transactions at Cloudy Bay have been so much calculated to impair."

In a subsequent despatch (dated November, 1844), Lord Stanley, in reply to Governor Fitz-Roy's announcement of the decision he had given, says, "I am of opinion that in declining to make the Wairau conflict a subject of criminal proceedings, you took a wise, though undoubtedly a bold decision."

From Nelson the governor returned to Wellington, and assisted in the completion of the New Zealand Company's purchase of land about Port Nicholson† (except the upper part of the Hutt Valley), while H.M.S. *North Star* sailed for Sydney. Mr. Commissioner Spain proceeded along the west coast towards New Plymouth, to endeavour to effect a settlement of the disputed purchases at Porirua, Manawatu, Wanganui, and Taranaki.

A new obstacle had been thrown in the way of a speedy arrangement of the land claims of the New Zealand Company during the past year, which has not yet been referred to, namely, the assumption of a right on their behalf by Colonel Wakefield, to be allowed to possess themselves of all the lands referred to in Mr. Pennington's investigation; viz., about one million acres, *exclusive* of the "native reserves," on which the Company had laid such great stress, as proofs of their generous dealings with the natives. Mr. Spain and Acting-governor Shortland at once declared that this interpretation of the agreement of 1840 was erroneous, upon which Colonel Wakefield

money, to four different tribes of natives, without difficulty, disturbance, or quarrelling among themselves."—Vide Governor Fitz-Roy's despatch to Lord Stanley, 15th of April, 1844.

admitted that his first reading and understanding of the clause in question agreed with theirs, and said that he had written home for further instructions.

Lord Stanley, in a despatch to Governor Fitz-Roy, dated 18th of April, 1844, referring to the repudiation by Colonel Wakefield of the native reserves, says,—

"There can be no question that they should be taken out of the Company's lands. The Company had, in former instructions to their agent, provided for reserving one-tenth of all lands which they might acquire from the natives, for their benefit. By the thirteenth clause of their agreement, of November, 1840, the government was in respect of all to be granted to them to make reservation of such lands for the benefit of the natives, in pursuance of the Company's engagements to that effect. It seems quite plain, therefore, that the government is to reserve for this purpose one-tenth of the Company's lands. The fact is almost proved by the very language of Colonel Wakefield's accounts themselves; for in assuming that the government was to allow for native reserves, over and above the quantity assigned for the Company, he is obliged to designate those lands as *the eleventh of the total grant*, a proportion which was never heard of until the present statement arrived. The reserves in question must therefore be taken from some part or other of the Company's lands."

On his return to Auckland, the governor assembled the Legislative Council to assist him in the consideration of the measures urgently required to bring about a healthier state of things in the colony generally. The first object requiring attention was the relief of the local government from its financial difficulties. At the beginning of 1844, the debt of the colony, or in other words, the deficiency of means to meet current expenditure, was £24,000, and the entire revenue for the coming year was estimated at only £20,000; all salaries and ordinary current payments were several months in arrear. The establishment was reduced to the scale authorized by the Secretary of State, at the close of 1843, but the estimated revenue was inadequate to meet even two-thirds of the contemplated expenditure, and the governor was strictly prohibited from drawing bills on the British treasury to cover deficiencies.

In this emergency Governor Fitz-Roy, in accordance with the advice of the Legislative Council, resorted to measures, the expediency of which, under the peculiar circumstances of his most trying position, he has ably vindicated. In truth, he had arrived at a very critical moment, and seeing at once the necessity for prompt and de-

cided action, he threw aside all personal considerations, and though deeply impressed with the responsibilities he thereby incurred towards her Majesty's ministers, he yet felt it his duty towards them, as towards the colonists, at once to take the course which he conscientiously believed could alone avert impending ruin.

His own words best describe the steps he felt bound to take, and their immediate consequence :—

"In order to carry on the government until assistance and directions could be received from England; to relieve the creditors of government from distress; and to keep numerous families from extreme privation, some from actually starving, it was decided to issue notes, or debentures, bearing five per cent. interest after the expiration of one year; and as these debentures were at first refused by several speculators, and therefore seemed likely to be much depreciated, they were made a legal tender. It should be noticed that this paper currency was not intended to be permanent; it was intended to serve instead of coin, during a very limited period, not exceeding two years,—before which it was probable that some arrangement would be made by the home government for their withdrawal from circulation. These debentures enabled the government to carry on its functions, and saved an extremity of disorder and distress which can hardly be appreciated by persons in an old country. Their principle has been much condemned by some theorists, (who reason about a young struggling colony without capital, as if it were really circumstanced like any portion of the parent state—supported by banks and capitalists); but since their beneficial effects were practically felt, and fully appreciated by those who might have been actually starved without them, the objections of theorists may be less regarded. As there were then no exports—the colony was drained of its small stock of specie by payments for goods and the usual necessities of life; and scarcely any circulating medium remained except notes of the Union Bank of Australia.

"But as the issue of paper money was in direct contravention of the governor's instructions, of course he was prepared to bear the consequences. There have been many occasions, it will not be denied, on which deviations from instructions have been productive of public benefit, however indefensible according to a general rule which must be maintained. Whether this was one of such occasions, the wretched state of the colonists in New Zealand may shew. Impending ruin, and actual starvation, threatened the greater number of the working classes, and many others, at Auckland, who depended on the government expenditure. No assistance from England could be expected in less than a year.—No money could be obtained by the government, in the colony, or from Sydney, because no person would accept bills drawn by the governor without the express sanction of the Secretary of State.

"The practical effect of these debentures was not only the removal of all actual want, but the promotion of much industry, and general improvement. Instead of a complete stagnation, as at the beginning of 1844, activity and abundant employment

* Appendix to Report from Select Committee on New Zealand, p. 77.

soon prevailed. Auckland and its vicinity improved rapidly, and an export trade began.

"The necessity under which the principal holders of debentures lay to employ them in the colony, and as speedily as possible, lest there should be any deterioration of value, induced those persons to buy up gum, flax, timber, or copper, or other native produce—to be exported as remittances to their correspondents instead of money. Some built small vessels; others improved their landed property by fences and better buildings. The results were conspicuously beneficial.

"How to raise additional revenue amidst such general poverty and distress, was most perplexing; various methods were suggested, but strongly opposed by the non-official members of council; who wished to reduce the expenditure to the revenue actually raised, however small that sum might be. At last an increase of the customs' duties was decided on—not as a good measure, but as the only one that seemed practicable.

"The governor deemed it to be his duty to endeavour to raise a revenue adequate to maintain the establishment ordered by the home government, and necessary for the public affairs of the colony. The non-official members of council considered the establishment and expenditure too large, and tried to effect such reductions as would, if made, have prevented the local government from executing the duties demanded from it, not only by the wants of the colony, but for the information of the home government, which requires numerous and voluminous documents to be prepared and transmitted in duplicate. In an old country there are so many ways of raising revenue that a selection can be made. In New Zealand, a young colony, there are very few, and it is a great object to adopt such methods as may be least open to evasion, while executed with the smallest expense. Land, if taxed, yields but little, as so little is cultivated, and the tenure of wild land has been too uncertain to admit of its being taxed. Houses, animals, imports, exports, sales, licences, deeds, and the individual members of the community, were the only objects available for taxation.

"As much censure has been cast on the propositions of the governor to tax houses, cattle, and dogs, it may not be irrelevant here to remind the reader that there were no "rates" of any kind in New Zealand, such as are paid for houses in other countries; that a house is an object easily rated or taxed, without the possibility of any evasion: and that the number of rooms in it may form an easy scale for taxing. To say, as has been asserted, that such a tax would induce people to alter the construction of houses,—when it was only to be levied for a temporary purpose, during two years at most,—was obviously incorrect.

"It was proposed to levy an impost on imported cattle, because a large importation was expected, which could not be smuggled. Their number, it was considered, would not be affected by a moderate duty. Besides which, at that time the importers of cattle could afford to pay a tax better than most people. They were chiefly persons living in New South Wales. The tax on dogs (also much blamed)

was intended solely as a means of diminishing their number, which had become a nuisance. It has been said that this tax would affect sheep-feeders. There were not then half-a-dozen shepherds' dogs in New Zealand; but had there been more, it would not have signified, because the proposed tax was to affect those dogs only which were found in or about the towns: dogs used in the country being specially exempted.

"Very incorrect accounts of proceedings in that Legislative Council appeared in newspapers, and possibly they may have been thought true, however strange, by persons accustomed to the correct reporting of public proceedings in England. They were, however, very incorrect, being the results of notes in common writing (not short hand) taken by the editors or composers of the Auckland newspapers, who trusted much to memory, and frequently coloured their statements so as to suit the taste of their readers."

The chief difficulty which impeded the efficient administration of the government, namely, the want of funds, was at the same time being experienced most severely in the Company's settlements, where the consequences of the reckless and unchecked expenditure, by the London directors, of trust funds, was at length revealed by the dishonouring of the bills drawn upon the Company by its accredited agents, the cessation of its operations, and the total withdrawal of the employment and support, the promise of which had induced so large a number of the labouring class to emigrate.

At the commencement of their difficulties, (July, 1843,) the directors, finding their old expedient for raising funds by the formation of a new settlement (New Edinburgh,) less acceptable to the public than their former projects, sought and obtained from Lord Stanley a supplemental charter, empowering them to borrow and raise, at lawful interest, any sum or sums not exceeding £500,000, upon the security and credit of any portion of the subscribed capital of the Company not called up, and of the profit of the undertaking, and of the lands, tenements, hereditaments, and other property for the time being, of the Company.

This resource proved insufficient; for letters from New Zealand, quite opposite in their tenor to those circulated through the influence of the Company, and other unprejudiced communications, were beginning to tell upon the public, notwithstanding the systematic, and it must be admitted most cleverly organized "puffing"† which was eration, say, they can "personally testify that the colonizing friends of Mr. Wakefield have never stopped at any means of corruption or coercion in order to secure a favourable notice of their speculations, and to suppress any record of, or criticism on,

* *Remarks on New Zealand*, by Robert Fitz-Roy. London, 1846,—p. 25.

† Messrs. Samuel and John Sidney, who have devoted great attention to the colonies, and whose independent conduct entitle their remarks to consid-

kept up throughout; and on 29th February, 1844, the chairman of the Company, Mr. Somes, announced to Lord Stanley, that "the large amount of £521,000, which, since the establishment of the Company, had been placed in their hands, together with £42,500, raised by loan last year, has, with the exception of £35,082 10s., now invested in such a manner as not to be immediately available [it was pledged], and about £7,000 now in our banker's hands, been *entirely exhausted*."*

The Company, under these circumstances, requested her Majesty's government to become their guarantee for a loan of £100,000, which they proposed to borrow from the public, as, without that guarantee, their "power of borrowing" was completely destroyed. The directors had the assurance to offer to government, as security, the 960,000 acres to which they claimed to be entitled by the investigation of Mr. Pennington in 1840, although they had professedly sold a large part of this land to the persons who had purchased the allotments at Wellington, Nelson, and New Plymouth, and were besides aware that their claims to that territory, in the first instance, rested upon the extinguishment of the native titles, which was likely to prove a complicated and expensive business. This offer to *place in pawn the property of others* was not considered satisfactory by her Majesty's ministers, who declared that they could listen to no application from the Company for pecuniary assistance, except on the following conditions:—First, that such assistance should not exceed £40,000 in the whole; secondly, that it should be applied to the payment of the dishonoured bills, drawn in the colony to provide for the employment of labourers, and to the payment of such other bills as might be drawn for the same purpose, pending a report from Captain Fitz-Roy, as to the state of the Company's settlements; and thirdly, that the whole of the property of the Company, including

their deception and mismanagement." With regard to Mr. E. G. Wakefield himself, these writers add, "we admit the ability with which he organized systematic praise of his model colonies, and disparagement of all imagined rivals, in parliament, in the press, the 'court, the city, and the mart;' and we can record the almost regal courtesy with which, sitting in receipt of custom at New Zealand House, in the palmy days of his Grand Bubble, he congratulated his enthusiastic victims on their fortunate prizes of 'corner lots and double frontages' at Wellington and Nelson."—*Sidney's Emigrant Journal*, Nos. 23 and 24; March, 1849.

that part of its capital which had not been paid up (£100,000,) and which the Company would be required to raise within a limited period, should be made liable as an available security for the repayment of such advance.†

Mr. Somes, on the part of the Company, declined to accede to these conditions, declaring, that the circumstance of the government requiring a security, in addition and in preference to the Company's land, was calculated to diminish their proper resources, (i.e. the credulity of the public,) by throwing discredit upon the tenure of their property, and by lowering them as a body in the public estimation; beside which, £40,000 was in itself a sum quite insufficient to meet the emergency. The practical effect of the loan, the directors affirmed, if accepted, would be to relieve—not the settlers, for the sole relief of whom the government had entertained the proposition of making one, but the Union Bank of Australia, and other parties by whom the dishonoured bills had been negotiated, for an expenditure previously incurred. The lowest sum sufficient to enable the Company to renew its colonizing operations, "till such time as the restoration of public confidence shall supply those means from the proceeds of the sale of land," was again stated at £100,000, and for this sum, a renewed application was made to the government by Mr. Somes, who followed it up by requesting, that in the event of the government declining the loan above mentioned, they would "still lend the Company the sum of £40,000, allowing it, at the same time, to borrow from the public £57,500, in addition to the £42,500 already borrowed, *conceding to the lenders of the £57,000 a preferable security upon the property and assets of the Company.*"‡

In reply, Lord Stanley, through Mr. Hope, expressed "extreme surprise" at being then for the first time made acquainted with the fact that the solicited

* Documents appended to Twelfth Report of New Zealand Company, p. 9 A.

† It will be remembered that the bond debt of the Company of £42,500, was also a lien on the £100,000 not paid up by the shareholders; and as to the lands belonging to the Company, the directors acknowledged to Lord Stanley, on 20th February, 1844, that they were then, "in the eyes of the public, perfectly valueless, and they could raise no money by mortgaging them."—Documents in Twelfth Report, p. 9 A.

‡ Appendix to Twelfth Report of the New Zealand Company, p. 23 A.

advance, if granted, *would not* benefit the settlers, and that all the evils against it, which it was asked to protect them were irremediable, he declined "the discussion of any further propositions until a report of the state of affairs should be received from Captain Fitz-Roy. In this communication there are assertions which deserve notice, as they have remained quite uncontradicted by the Company, namely,—

"That the whole advance of money made by the Company on their own account, amounted only to £200,000, that on this the Company had received and distributed in the shape of dividends no less than £44,000, exclusive of the sums laid out in very extensive establishments, both at home and in the colony; that, exclusive of a claim to have confirmed to them the title to many hundred thousand acres of lands, *understood to have been purchased by them in New Zealand*, the Company were in possession of assets (some of which, however, were not immediately available) to the extent of £42,000, while their debt did not exceed a similar amount, and that there remained £100,000 of unpaid-up capital."*

Lord Stanley, in the above passage, adverts to "the very extensive establishments both at home and abroad" maintained by the Company; he might have used stronger language with equal justice, for perhaps a more inexcusable course of expenditure, both general and particular; wholesale "jobbery" and misappropriation of monies invested or intrusted for special purposes, never disgraced a public association, yet in an early report of the directors (1st of May, 1841), it had been ostentatiously proclaimed that "the practical details of systematic arrangements for emigration will be *much more cheaply and efficiently executed* by the representatives of such a body as this, than by the executive government:" and in the prospectus issued in May, 1839, to attract shareholding capitalists, the public were assured that "*the Company is capable of being managed at little expense for agency.*"

Both these vaunts were belied by facts, for the emigration was conducted at an enormous expense, but in a most unsatisfactory manner; and the practical working of the Company, even by their own shewing, was on an exaggerated and very costly scale.

It appears that up to the period when the Company declared itself bankrupt, it had actually sold land to the public as follows:—in *Wellington* settlement, 990 town, and 126,800 rural acres = 127,790 acres; in the *New Plymouth* settlement, 282½ town, 3,600 suburban, and 9,550 rural acres =

18,432½ acres; in the *Nelson* settlement, 432 town, 21,600 suburban, and 64,800 rural acres = 86,832 acres. The total in the three settlements was, town, 1,704; suburban, 25,200; rural, 191,150; grand total, 218,054 acres. These figures are derived from the accounts appended by the Company to their twelfth report, from which we also gather that the amounts acquired by the Company in the sale of this land, was,—at *Wellington*, £120,040; at *New Plymouth*, £26,560, and at *Nelson*, £129,600; total, 276,200. Thus the Company obtained from the public upwards of a quarter of a million sterling, for less than a twentieth part of the territory, over which they had professedly obtained an unimpeachable title from its native proprietors, for about £1,500, (see div. v., p. 158).

Doubtless, had this purchase, in the first instance, been to any extent real, instead of nominal, the commercial speculation, which it should be borne in mind was avowedly the sole object of the New Zealand Company, would have proved a very profitable scheme; as it was, the results have been anything but satisfactory to the shareholders in general, and ruinous to a large and highly respectable portion of the land purchasers.

In addition to the money received for sales of land, the Company acquired funds for passage money, freight, forfeited deposits, and other sources, amounting to £37,225; £10,000 was raised on loan; £32,500 on debentures, and £200,000 was the amount paid up by the shareholders; the total sum therefore of which the directors had the expenditure, up to 14th of February, 1844, exceeded half-a-million sterling; viz., £563,924.†

To trace this expenditure in a satisfactory manner is not possible, from the confused, often contradictory, and excessively diffuse style of the published accounts of the Company; items that ought to be distinctly specified, are jumbled up with others, as if on purpose to preclude investigation. The "*home establishment*," is put down under six items, at £87,574, i.e., for five years at the rate of more than *seven thousand pounds* annually; the emigration service, viz., the hire of ships and incidental expenses, is put down at £185,760, which, at £12 a head, would have conveyed more than 15,000 men, women and children of the labouring

* Appendix to Twelfth Report of New Zealand Company, p. 25 A.

† Documents appended to Twelfth Report of Directors of New Zealand Company, p. 32 A.

class to New Zealand.* The "miscellaneous" items are grouped together to the large amount of £118,435, and the colonial expenses are stated at the enormous sum of £184,371, or at the rate of more than £36,000 for each of the five years, irrespective of the civil, military, and naval expenditure incurred by the Crown.

Among the items of the "home establishment," the charge for "advertising and printing, books, maps, &c.," is put down at £7,788, or more than £1,500 per annum; the law expenses and professional services are quoted at £6,597; stationery, postages, &c., at £4,414; rent, taxes, furniture, &c., at £6,027.

It appears also that some person received £7,780 as "commission on the sale of land."†

The dividends to the proprietors on £100,000 capital for four years, and on a similar amount for less than three years, are put down at £44,264. The purchase of lands, including the ship *Tory* and her investment, is stated at £60,815, but to whom this money was actually paid it is not possible to ascertain. Mr. Pennington says, in April, 1841, that the New Zealand Land Company "paid and contracted to pay £20,000 to the New Zealand Company of 1825, for the lands acquired by that Company by purchase from the native chiefs, and they have likewise paid to the New Zealand Association of 1839, the sum of £40,000 for all the rights, interests, and lands which that association had acquired, or *might become entitled to* in New Zealand, and for the ship *Tory* and her cargo then on the outward voyage to that colony."‡ The value of the *Tory*§ was estimated at £9,000, and her cargo at £6,000 = £15,000, leaving £25,000 to be appropriated among the New Zealand Association of 1839, who, there is every reason to believe, were nearly identical with the New Zealand Company of 1840.

As an illustration of the annual rate of ex-

penditure, the chief items of the year ending 5th of April, 1842, may be quoted, under the heads given in the Company's accounts:—||

Salaries, colonial and home establishments, outfit of colonial officers, and allowances for services	£10,127
Commission on sale of land	3,201
Bills drawn from New Zealand	9,984
Advertising, printing, books, and stationery	2,802
Rent, taxes, law charges, postages, house and incidental expenses	3,471
Furniture	136
Passage of emigrants, their maintenance previous to embarkation, and incidental expenses connected therewith	68,591
Provisions, stores, &c.	9,194
Dividends to proprietors	15,842

The New Zealand Company, in the spring of 1844, found themselves in an equally embarrassed and considerably more discreditable position than that from which they had been relieved by the grant of a charter three years before. It was hopeless to continue urging upon the government that their title to lands had been admitted solely in consideration of their expenditure on colonizing purposes, after the explicit and emphatic denial which this unfounded assertion had received,—Mr. Hope, on the part of the colonial minister, having informed Mr. Somes that—

"Lord Stanley cannot now permit it to be maintained either that the natives had no proprietary rights, in the face of the Company's declaration that they had purchased those very rights, or that it is the duty of the Crown either to extinguish those rights, or to set them aside in favour of the Company. The fact of the validity or invalidity of the purchase was known to the Company, and to them alone; the assumed validity was the basis of the promised grant; and if the facts were incorrectly stated at the time, or were incapable of proof, with the Company must rest the inconvenience and loss resulting from their own mis-statements."¶

The Company being therefore in a condition, with all to gain and nothing to lose, directed their parliamentary influence once again to obtain a committee of inves-

* One instance will shew the reckless manner in which the emigration expenses were incurred: of six ships taken up for the New Plymouth settlement, the cost was £30 18s. per statute adult, irrespective of the victualling of the passengers, which was paid for at the rate of 1s. 3d. per head daily, or about £8 16s. Altogether the charge for each emigrant was nearly £40, or more than twice the sum which ought to have been paid. It should also be stated that the accommodation and general conduct of these vessels was far from being commensurate with the extraordinary cost.

† For these and other details see Appendix to Report from Select Committee of the House of Commons on New Zealand, in 1844, p. 393.

‡ Parliamentary Papers on New Zealand, 12th August, 1842; pp. 4, 5.

§ The *Tory* was lost (I believe, on or near the coast of New Zealand), and the New Zealand Company received £9,220 as insurance on her.

¶ See Fifth Report of New Zealand Company, Appendix B, p. 35.

|| Appendix to Report from Select Committee on New Zealand, 1844; p. 21.

tigation on the state of New Zealand. This time the result was more favourable to them, for after much discussion, the majority of the committee adopted a Report, which, though it commenced with the declaration "that the conduct of the New Zealand Company, in sending out settlers to New Zealand, not only without the sanction, but in direct defiance of the authority of the Crown, was highly irregular and improper," went on to disapprove of the treaty of Waitangi, and still more the view of it acted upon by the local authorities, and proceeded to assume to the Crown a right of sovereignty and disposal limited by little beyond such right of property as might be conceded to the native inhabitants in favour of those spots on which they had placed their pāhs or planted their vegetables,* and declared that the New Zealand Company had a right to demand from the Crown a certain number of acres, "without reference to the validity or otherwise of its supposed purchases from the natives."

The difficulty of how the Crown was to obtain the land it was thus advised to make over to the Company, was met by a proposition of confiscating it, in the first instance, by the imposition of a land tax, to be paid in advance. A counter-report was proposed and moved by the under-secretary of state for the colonies (Mr. Hope), which contained a lucid statement of the difficulties and dangers likely to result from the course proposed: but he was in the minority.

Mr. Cardwell (one of the lords of the treasury under Sir Robert Peel) also proposed a series of resolutions in favour of the policy pursued by the colonial office, which was likewise rejected by a majority of one. Among his recommendations was the following, which it is to be hoped will yet be adopted, viz.:—"that it would be expedient to admit native chiefs, and others, into the military and civil service of the colony."

The government, notwithstanding the report of the select committee, persisted in adhering to the conclusion which it had adopted respecting the validity of the rights of the natives, and was supported by a majority of the House of Commons in its deter-

mination, after a debate, originated by the late Mr. Charles Buller (the legal adviser of the Company), which lasted three days; and on 30th November, 1844, Lord Stanley expressed to Governor Fitz-Roy his general approval of the course adopted, and of the tone taken by him in reference to the various subjects by which, on his arrival, he had found the community distracted. His lordship referred particularly to—

"The strong sense of justice, and the earnest desire of reconciling differences by an effectual and authoritative mediation which appear to have influenced your conduct; to the boldness and promptitude with which you have promulgated and enforced your views, and met, by decided measures, the emergencies of your embarrassing position.

"If, in these circumstances, you have been compelled to overstep the letter of your instructions, I find sufficient vindication for your course in the necessity for prompt and efficient action, and in the impossibility, within a reasonable period, of obtaining my sanction to your proceedings. When her Majesty's government selected you to fill a very laborious, responsible, and ill-remunerated office, in a very distant colony, they were fully aware that the discharge of your duties would be impossible unless the largest discretion were left to you; and they felt that they had the best guarantee for your conduct in your high personal and public character, and in your peculiar fitness, at that time acknowledged by all parties most interested, for the post which was assigned you."†

At the time this despatch was written, the critical state of affairs in New Zealand had induced Governor Fitz-Roy to adopt measures which rendered him still more obnoxious to the Company, and which, though taken from a sense of imperative necessity, were yet beyond, if not in contradiction, to the instructions he had received from her Majesty's ministers. Two causes of immediate anxiety, affording unmistakable indications of the growing disaffection of the natives towards the government, as well as towards the settlers generally, were made known to him at the close of the sitting of the Legislative Council in July, 1844. The former of these may be best related in the words of the first bishop of the diocese of New Zealand, Dr. Selwyn, who arrived at Auckland in 1842. In a letter addressed to the secretary of the Society for the Propagation of the Gospel, he says—"About the middle of the year 1844, the flag-staff on the hill above Korarika [Russell] began to be talked of as a sign of the assumption of New Zealand by

* *Vide* the comments on the Report of the Select Committee of 1844, in an admirable essay *On the British Colonization of New Zealand by the Committee of the Aborigines Protection Society*, p. 26;

and also in a pamphlet by Mr. Dandeson Coates, entitled *The New Zealanders and their Lands*.

† Parliamentary Papers on New Zealand, 1845 page 49.

the British government. * * * Meetings began to be held, at which John Heké* was the chief speaker, the subject of discussion being the cutting down of the flag-staff. In the month of August, 1844, Heké assembled a party of armed men, and proceeded to Kororarika, where he spent Saturday and part of Sunday in alarming the inhabitants, and early on Monday morning mounted the hill, and cut down the staff. I was at Paihia [a mission station near Kororarika] at the time, engaged in the native school, at the close of which the first words I heard were, 'Kua hinga te kara,' 'the colour has fallen.' I shuddered at the thought of this beginning of hostilities, so full of presage of evil for the future. Heké then crossed to Paihia, and, with his party, danced the war-dance in my face; after which, many violent speeches were made, and they then returned to Kaikoke [Heké's pah, or village]. On intelligence of Heké's proceedings being received by Captain Fitz-Roy, he immediately made application to the governor of New South Wales for troops, and sent thirty men from the small detachment stationed at the capital to Russell, with directions to the police magistrate to replace the flag-staff, and to persevere in temperate and conciliatory measures until self-defence should render hostility unavoidable. The other tidings which reached him, almost at the same time, were, that very serious disturbances had taken place at New Plymouth, in consequence of Mr. Spain's having decided against the natives, in favour of the New Zealand Company's claims to the land comprised in the plan of that settlement. The governor proceeded thither by sea, and was met by the bishop, who had travelled overland from Auckland in only seven days (the usual time being a fortnight), to assist in restoring tranquillity. Here, again, it may be best to give Captain Fitz-Roy's own relation of his conduct and motives in this difficult and complicated business:—

"It appeared so clear to the governor that the view taken by the commissioner could not be adopted by the government without causing bloodshed, and the probable ruin of the settlement; because the

* This chief, who afterwards obtained so much notoriety, was then of inferior rank, and thought to possess but inconsiderable influence: he had, however, married the daughter of the celebrated E'ongi, or Shongi, herself a remarkable woman, by whom he had had several children, who, like himself and his wife, were baptized in the Christian faith.

injustice of awarding land to the New Zealand Company, which was well known not to have been purchased by them, was apparent to every native, that information was made known publicly at a large meeting of the settlers and natives, that the commissioner's award would not be confirmed by the governor.

"Arrangements were then commenced for securing the actual settlers in quiet possession of sufficient land; the natives being desirous that they should not quit the place, but determined not to sell them certain favourite localities. The substance of the case was this—the New Zealand Company's agents had endeavoured to buy a large tract of land from a few persons who owned about a thirtieth part of it, the great majority of the proprietors being then absent. When the absentees returned to their own places, after a few years, they found white men settled there and cultivating. Of course the few (about forty) who professed to sell to the Company's agents could not dispose of that which belonged to the absentees (many hundreds in number), therefore their land was forthwith demanded by them. However much this case may have been complicated or mystified by appeals to other laws than those of the New Zealanders themselves, the above will be found the simple fact. It may be asked what Englishman would give up his land under analogous circumstances, if sold without his authority during his absence? But, say some persons, these natives who returned to claim land occupied by settlers, were or had been slaves, and therefore they had no right to this land. Strange doctrine this to be held by Englishmen! These men had been made prisoners of war—captives rather than slaves—by the Waikato tribe, who, at the instigation of Christian teachers, gave them their liberty, and permission to return to their own land.

"Would an Englishman, after some years' confinement in a French prison, or being enslaved by Africans, admit that he had forfeited his estate in England? But even the New Zealand usages, which in this case are more to the purpose, do not prevent a man who has been captured (or a slave) from owning and retaining land."†—(See div. v. p. 170.)

Mr. Spain, in vindicating the grounds on which he formed the decision thus set aside by Governor Fitz-Roy, for the reasons above stated, says—

"I am fully of opinion that the admission of the right of slaves† who had been absent for a long period of years, to return at any time and claim their right to land that had belonged to them previously to their being taken prisoners of war, and which before their return, and when they were in slavery, had been sold by the conquerors and resident natives to third parties, would establish a most dangerous doctrine, calculated to throw doubts upon almost every European title to land in this country, not even excepting some of the purchases made by the Crown; would constantly expose every title to

† *Remarks on New Zealand*, by Robert Fitz-Roy, pp. 29, 30.

‡ According to Captain Fitz-Roy the absentees in question were *captives* but not *slaves*.

§ Governor Hobson (after the purchase of the Taranaki District from its few actual inhabitants) had paid a certain sum to the chief of the Waikato tribe, in satisfaction of his claims as conqueror.

be questioned by any returned slave who might assert a former right to the land, let the period be ever so remote, and would prove a source of endless litigation and disagreement between the two races."*

Leaving New Plymouth, the governor, accompanied by the bishop, proceeded to Auckland, and from thence to the Bay of Islands, being anxious to meet the troops then daily expected from Sydney. One hundred and fifty men had arrived and disembarked; fifty were added from the detachment at Auckland; and H.M.S. *Hazard* had fifty seamen and marines ready to land: the force being, in all, but two hundred and fifty. Previous to making a decided movement towards Kaikohe (Heké's stronghold), several meetings were held with the natives by the governor, to whom it appeared so obvious that the main cause of their discontent was the deserted state of the once crowded port, owing chiefly to the customs' regulations, that he determined to remove this root of evil, and forthwith took upon himself the responsibility of closing the custom-house. The troops were then moved to the Keri-keri river, and were about to debark and march inland, when Mr. Clarke, the chief protector of aborigines, arrived as the bearer of an urgent request to the governor, from a large majority of the head chiefs, not to land the troops, but to accept from them an acknowledgment of Heké's delinquency, and a pledge that such outrages should not be repeated. The governor complied, and proceeded, attended only by the senior military and naval officers, to the missionary station at Waimate, where, in the presence of the bishop and several of the clergy, he addressed a large concourse of natives, and explained to them clearly and fully the intentions of the British government. The chiefs offered, in atonement for Heké's offence, to forfeit land or property; but the governor declined to take land, and demanded only ten muskets, in acknowledgment of the insult. More than the required number were instantly laid at his feet by some of the oldest and most influential chiefs, to whom they were returned, to show that no desire existed to punish the well-disposed for the faults of their relative, or even to deprive them of their weapons. The return of the muskets has been sneered at as a piece of Quixotic chivalry; but, in the opinions of some of those best ac-

quainted with the native character, it is believed to have had a permanent effect in determining the conduct of Walker, Nene, Patuone, Tawhai, Taonui, and other actors in that scene, who have since proved most trusty and powerful allies to the British government. Heké, however, stood aloof from the meeting, but was subsequently persuaded—almost compelled to write an apology for his conduct. The additional troops then returned to Sydney, in accordance with the especial desire of Sir George Gipps, that they should be retained no longer than the particular emergency for which they had been sent should require.

In the month of October, Governor Fitz-Roy, who had previously waived the Crown's right of pre-emption, and permitted individuals to purchase land of the natives, on the payment of a fee of ten shillings an acre, finding that that sum, in most instances, exceeded the price paid to the natives, and virtually acted as a prohibition, reduced it to an almost nominal one, sufficient only to cover the expenses of legal documents (one penny per acre.) This measure was very gratifying to the aboriginal population, and peace seemed restored, but was again seriously interrupted. In December, the report of the committee of the House of Commons on the state of New Zealand, recorded July, 1844, reached the colony, and soon became known to the natives, who evinced great indignation on learning the opinion of members of the Imperial Legislature respecting the treaty of Waitangi, and their recommendations with respect to the so-called waste land of the islands. Symptoms of disaffection became daily more apparent, and a number of turbulent young men, encouraged by Heké, carried off horses under vague pretences. Threats were held out that the obnoxious flag-staff should not remain; and early in January, Heké went by night and cut it down. It was not then guarded, except by a party of natives, who, on hearing of Heké's intention, stated at first that they would oppose him, but subsequently declared they would not be the first to shed blood on account of a piece of wood. Heké departed unmolested, after sending word to the magistrate at Kororarika (Russell), that in two months he would return to destroy the gaol and custom-house, and to send away the officers of government.

On learning what had occurred, Governor Fitz-Roy dispatched the *Hazard* with a

* Vide Reports of Commissioners of Land Claims on Titles to Land in New Zealand. Parliamentary Papers, April, 1846, p. 63.

small detachment of troops, all that could be spared from Auckland, with a musket-proof block-house to be erected at the flag-staff. The settlers were armed and drilled; a strong stockade was erected, as a place of safety for the women and children, and some small guns were mounted. No anxiety as to the result of an attack was entertained, but on the contrary, far too low an opinion of native enterprise and valour prevailed.*

Parties of armed natives, to the number of several hundred, assembled in the neighbourhood of Kororarika during the first few days of March, 1845, and commenced hostilities by attacking and plundering the house of a settler, near the Kawakawa river. The *Hazard's* pinnace, armed with a gun in the bow, pursued the party and drove them ashore, from whence a fire was opened upon the boat by the fugitives, who had concealed themselves in the brushwood. These were the first shots fired. They were returned, but without effect, by the pinnace, which then proceeded to the ship.

For several days after this, the natives were evidently gathering their forces, and desultory skirmishes took place, but without occasioning loss of life on either side. Heké announced his determination to attack Kororarika, the day on which it was to be done, and even the particulars of his plan for the assault. At day-break, on the 11th of March, Captain Robertson, R.N., at the head of a party of seamen and marines, went out to reconnoitre a valley leading to Matavai Bay, through which the attack was expected to be made, and met a large body of natives advancing with that intent. An engagement immediately began, in which the natives were repulsed; but a party of the Maories, who had been lying in ambush, cut off Captain Robertson from the main body of his men; and a native coming within a few paces of him, fired a shot, which shattered his thigh. At this time he was surrounded by the enemy, but his men rallied and rescued him, and he was carried off to his ship. The flag-staff was soon after taken by the enemy, and the block-house was captured by surprise, (the officer in command having drawn off the men to some distance to strengthen the entrenchments.) The keeper of the signals was severely wounded; his wife and daughter were taken prisoners, and conducted to Heké,

who sent them down with a flag of truce to the nearest English post; the party of natives who conducted them remaining within gun shot till they saw the woman and child safely lodged.

It was apprehended that the natives, having possession of both ends of the town, and the command of all the paths along the hills, would collect their forces, and make a simultaneous attack upon the points still remaining in the possession of the English. It was therefore deemed necessary to remove the women and children from the stockade or fortified houses, which was accomplished by the boats belonging to the vessels in the harbour, which conveyed them, together with the wounded, on board the ships, the natives offering no opposition. One woman alone remained by her own desire to attend to those who might be wounded. About two hours afterwards the powder magazine exploded, shattering the house to pieces, and causing a fire by which the whole was totally destroyed. The brave woman, before mentioned, fell under the ruins, and was removed to the ship with a dangerous fracture.

An evacuation of the place was then determined upon, and the whole population were safely embarked on board the *Hazard*, the *St. Louis* (United States frigate), and the *Matilda* (English whaler), after which the natives plundered and burned the town, leaving only the churches and the houses of the missionaries standing.

On the British side thirteen were killed and twenty-three wounded, some of whom afterwards died of their wounds. Of the natives, thirty-four were known to have been killed and at least sixty-eight wounded.†

Bishop Selwyn, who was present at the destruction of Kororarika, and whose conduct on that occasion was worthy the character of a truly Christian minister, has given a most interesting narrative of the events connected with it; his description of the conduct of the natives especially deserves the attention of all who desire to understand the character of this singular and deeply interesting race. He says,—

“The state of the town after the withdrawal of the troops was very characteristic. The natives carried on their work of plunder with perfect composure; neither quarrelling among themselves, nor resenting any attempt on the part of the English to recover portions of their property. Several of the people of the town landed in the midst of them, and

* Captain Fitz-Roy's *Remarks on New Zealand*, p. 38.

† See Parliamentary Papers relating to New Zealand, 1845; p. 6.

were allowed to carry off such things as were not particularly desired by the spoilers. With sorrow I observed that many of the natives were wheeling off casks of spirits, but they listened patiently to my remonstrances, and in one instance, they allowed me to turn the cock, and let the liquor run out on the ground. * * * Altogether there must have been about 500 men [natives] on the ground. * * * On the way [from Paihia, whither the Bishop had gone to inter the bodies of some of the slain, to the Waimate,] one of those circumstances occurred which mark, more than words can express, the confidence with which the old settlers live among the natives of the country. I had gone about half-way to the Waimate when I met a settler from Hokianga, riding quietly down to the Bay, with one native behind him, to learn the particulars of the engagement. He had come thirty miles through the country from which Heké's forces were drawn, and was going to the scene of action, and I afterwards met him returning by the same route without the slightest apprehension of danger. The truth is, that there is something in the native character which disarms personal fears in those who live among them and are acquainted with their proceedings. All suspicions of treachery seem to be at variance with the openness and simplicity of their proceedings. * * * From a hill near the Waimate the whole outline of the town could be seen, lighted up by the blaze of the burning houses. My approach to the station was greeted by a large body of Christian natives, with a louder and heartier shout of welcome [Haere mai!] than I had ever heard before. They invited me to a general meeting, at which all the principal persons expressed their determination to defend the missionaries and their families to the last, and begged me earnestly not to think of removing them. Their feeling was responded to by Mr. and Mrs. Burrows and Mr. and Mrs. Davis, the missionaries of the station, who had resolved to stand firm, in the assurance that the same Power which had guarded the mission through thirty years of trial and anxiety, would defend it to the end. The native school, which I left with only thirty children, had thriven in the midst of the troubled times, and had risen to seventy. No sooner was it heard that I was in the house, than a stream of little children flowed down from the bed-rooms in the upper story, their black eyes and white teeth sparkling in the candle-light as they crowded about me, with smiling faces, to shake me by the hand. As some of the Christian natives remarked, "Though the heavens were black around us, this was the bright spot of blue sky, which gave hopes that the storm would soon pass away."

When the three ships which conveyed the refugees from Kororarika were seen in the offing, the Auckland people welcomed their arrival most joyfully, supposing they brought troops from Sydney, or perhaps from England. Their hopes were changed to deep forebodings when the truth became known; but the disappointment did not check their endeavours for the benefit of the unfortunates thus thrown upon their charity, and every exertion was made to succour the

wounded and provide for the pressing wants of the destitute refugees, about 400 in number.

It was now thought advisable at once to raise a militia, a measure which the home government had from the first enjoined upon Governor Fitz-Roy, but though proposed in the previous year (1844), his excellency had agreed with the legislative council in the propriety of deferring the enactment of a militia ordinance, as highly objectionable on the grounds of its being calculated to raise the suspicions of the natives, and quite inadequate to overawe them; as likely to prove most inconvenient to the widely-scattered settlers, and moreover, as being barely practicable, because there were not 400 stand of serviceable arms in the colony, and very little ammunition, while the local government had not the means of buying either arms, ammunition, clothes, or accoutrements, or even of paying adjutants or drill sergeants. These and other considerations had therefore made the council unanimous in postponing the militia bill; but in the following year, when one settlement had been destroyed, and the attack of others was threatened, the case was totally changed, and it became imperative to resort to every possible expedient in self-defence.

The sudden demand for Kauri gum, in which the northern part of the island abounds, happened providentially at this particular time, when the attention of the natives were most required to be drawn off from thoughts of Heké's exploits, and the plunder he had acquired; while it also gave immediate employment to numbers of suffering settlers, who must otherwise have been dependent upon their compassionate neighbours. Yet this good was not unmixed with evil. The natives obtained large supplies of ammunition in exchange for their gum; and although loyal natives were usually the direct traders, no doubt much found its way through their relatives to the rebels.†

The destruction of Kororarika, and the consequent stoppage of trade in the Bay of Islands by the natives' own act, had given a different aspect to the question of raising a revenue by direct taxation, or by a custom-house establishment, and the attempt to raise a revenue by direct taxation had failed in the southern settlements, where evasion was almost general, on the plea that until

* *Annals of the Diocese of New Zealand*, pp. 193 to 197.

† *Remarks on New Zealand*, p. 43.

the settlers obtained legal titles to their lands they could not be considered to have either property or income. "To enforce the payment of their just rates or taxes, it would have been necessary for the government to enter into legal proceedings against half the landholders at New Plymouth, and against nearly all those of Wellington and Nelson."* The custom-houses and their officers were therefore re-established, but on a much reduced scale, not exceeding one-half of their expense in 1843. Farther reductions in the estimated annual expenditure of the colony were proposed by the governor, and adopted by the Legislative Council. The estimated expenditure for 1845-6 was £26,000. The estimate for 1844-5 had been £36,000; that for 1842, in Governor Hobson's time, it will be remembered, was £56,000. These reductions were partly consequent on the termination of an expensive land claims commission; partly effected by reducing salaries, and partly by the alterations in the establishment for the collection of customs.

It again becomes necessary to revert to the proceedings of the New Zealand Company. In all their settlements great suffering and general depression had been caused by their sudden and unexpected declaration of insolvency: they dishonoured the bills drawn upon them in pursuance of their own instructions, and abruptly and without compensation broke up all contracts, to the great injury of many persons in their employ; yet at that very time they appear, by their own statement of accounts, to have had about £15,000 available at the Wellington and Nelson Banks, an amount which would probably have sufficed to satisfy the lawful claims of the contractors and other injured parties, including even those of the natives. Long before this crisis all classes of the Company's settlers had felt more or less painfully, according to the varying circumstances of their position, the cruel disappointment which a too credulous belief in its promises had entailed upon them. The case of the labourers who had been induced to emigrate on the positive pledge of being provided with constant employment at a fixed price in the event of their being unable to obtain better remuneration elsewhere, is alone sufficient to affix a lasting stigma on any association, however high the social standing of its real or nominal directors.

* *Remarks on New Zealand*, p. 45.

The manner in which the poor emigrants were treated at Nelson has been already described (see p. 205.) As a sample of what they endured at the other settlements, it needs only to quote the following extract of a letter from Mr. J. T. Wicksteed, Resident Agent of the Company at New Plymouth, to Colonel Wakefield, dated 31st October, 1843:—

"You are aware that the emigrants to this settlement hold what they call 'embarkation orders,' being a sort of hand-bill signed 'Thomas Woolcombe,' in which it is distinctly stated, that the Company 'will, at all times, give them employment in the service of the Company, if, from any cause they should be unable to obtain it elsewhere.' Being unable to give any other interpretation to this promise than the words quoted seem to imply; and yet bearing in mind, that the Court of Directors view their engagement in a different light, I endeavoured to evade it, by sending the applicants for employment a long distance from home, making no allowance for time spent in the journey, or for time lost in bad weather. The necessities of the men and their families were such as compelled them to submit for several weeks to these conditions; but many came home sick, and claimed the promised medical aid; and others commenced the trade of pig and sheep stealing, not having yet had time to raise potatoes for themselves. It then appeared to me, that the parties were really 'destitute,' and I endeavoured to find employment for them from the landowners, by paying their wages in part. . . .

"Looking at the stringent instructions of the Court (of Directors) not to admit the 'claim' of anybody who had once found work with a private individual to a re-engagement with the Company, I should deem it my duty to adopt the same rule with the whole population, were it safe to do so. The Company possesses a very valuable property here in houses, stores, boats, &c., which would assuredly be destroyed, did I refuse to recognise claims on the Company for employment or support. The private houses and stores would also be plundered."

On the 30th of April, 1845, Lord Stanley signified to Governor Fitz-Roy her Majesty's disallowance of the ordinance authorizing the issue of debentures to the amount of £15,000, and making the same a legal tender, on the grounds that the local legislature in passing it had assumed a power they did not really possess, and that the ordinance itself was a direct infringement of a principle "co-extensive in its operation with the colonial possessions of the British Crown." A despatch bearing the same date conveyed to the governor his recal, for reasons which were stated at considerable length by Lord Stanley in a communication dated May 14, 1845. The general causes assigned, were, "the defects in circumspection, firmness, and punctuality" which had occurred during his administration, and the repeated infringement of his instructions.

The more specific grounds of complaint were, the want of punctuality in acquainting her Majesty's ministers with his proceedings, the making paper money a legal tender, permitting the natives to sell land without a concurrent fee to the government, the temporary abolition of the custom duties, and other measures, of which the government had probably heard a most exaggerated account through the various organs of the New Zealand Company. In conclusion, Lord Stanley reiterated his sense of Captain Fitz-Roy's claims to the most implicit confidence in his personal character, and his zeal for the Queen's service, assuring him "with how general a consent" the House of Commons had acquiesced in the opinion expressed by him (Lord Stanley) in the subjoined paragraph of his dispatch of the 30th of April, when quoted by Mr. Hope in his place in that house:—

"The concern with which I announce this decision is greatly enhanced by the remembrance of the public spirit and disinterestedness with which you assumed this arduous duty, and of the personal sacrifices which you so liberally made on that account; nor can I omit to record, that in whatever other respect our confidence in you may have been shaken, her Majesty's government retain the most implicit reliance on your personal character, and on your zeal for the Queen's service. You will, therefore, readily believe, that I have acted on this occasion in reluctant submission to what I regard as an indispensable public duty."

The announcement of Governor Fitz-Roy's recal, although, as before stated, it bore the date 30th of April, was not dispatched until the 29th of May, his explanations of the extreme and pressing emergencies which had induced him to infringe his instructions, arrived at the Colonial Office only a few days later.

In an able vindication of his conduct addressed to Lord Stanley, and dated November, 1845, the recalled governor alludes to this circumstance. He writes,—

"Your Lordship kindly expresses anxiety to find an apology for such of my acts as you were not able to approve; but my own explanations of the reasons of those acts were not then before you. I cannot say that they would have been satisfactory under the circumstances of that period, but I think that a few days' delay would not have been ill bestowed on an honest and hard-working public servant. * * * I acknowledge most fully the obligation under which I lay to take my measures circumspectly, to pursue them with firmness, and to report them with punctuality."

"Of my circumspection, only those could then judge fairly who were on the spot; but now your Lordship may also be enabled to form an opinion from recent events—at that time only threatening.

Of my firmness in pursuing one main object, that of endeavouring to promote the welfare of the colony, and to prevent the white and coloured races from coming into collision, while the white race was entirely in the power of the coloured, your Lordship may be aware, now that the real power of the natives, and the truly precarious state of our countrymen is becoming at last understood, and fully acknowledged. I thought, as I still think, all matters of ordinary arrangement; such as the mode of raising revenue, or the description of circulating medium, altogether inferior in importance to that question on which, in New Zealand, to the present hour, every thing depends: namely, the relations between the two races.

"That I have not reported my proceedings with punctuality, has been a natural consequence of the distance of New Zealand from England, the uncertainty of communication, the months that had elapsed at times without the means of sending letters, the delays at Sydney, and my own absence from some part whence a vessel sailed.

"It appears to have been overlooked at the Colonial Office that vessels sail from one port of New Zealand without their being always previously mentioned at other ports. A month is usually required to obtain a reply from Wellington to a letter written at Auckland, and *vice versa*. But as every vessel, however small, conveys the latest local paper from one port to another, intelligence is often carried by such means unknown to the officers of government."

After adverting to the necessity he was under to visit Cook's Straits three times during the first ten months of his residence in the colony (which visits occupied together a period of eighteen weeks), and to the disturbances which had compelled his presence at New Plymouth, and at the Bay of Islands; he adds, that as it was impossible for him to move actively, and endeavour to prevent fatal disasters by personal influence, and at the same time employ himself in preparing sufficient accounts for the home government, he had been compelled to choose between two alternatives, and preferred acting first and afterwards writing. Alluding to the intricacies of the New Zealand question, all the bearings of which "a volume would not suffice to shew distinctly," he remarks:—

"In few words I may here remind your Lordship that the British Government has undertaken to deal with the numerous and well-armed descendants—the formidable 'fragments' [Toenga] as they express themselves, of a nation formerly half-civilized, of whose customs they still retain indelible traces, and to whose laws they still adhere with pertinacity, though they can now give no reason for them, except that their ancestors observed them. The 'Ritenga Maori,' or native 'Common Law,' cannot be set aside by force or hastily. Christianity has done much—strictly just conduct on our part may also do much towards civilizing the New Zealanders: but injustice or oppression will drive them back into utter barbarism."

After explaining the causes of his "ap-

parent vacillation of purpose," Captain Fitz-Roy adds,—

"While appearing to vacillate, I was firm to my purposes—of preventing collision between the white and coloured races, and of mitigating the distresses of many colonists, while endeavouring to promote the progress of others. From these objects neither slander, abuse, nor misrepresentation could divert me; and I acknowledge distinctly that I considered all other objects inferior to these. I looked at the totally exposed and defenceless state of all the settlements, without walls, stockades, or any kind of efficient protection, without even a place of refuge for women and children. I remembered the destruction in Chili of seven Spanish towns in one night by Aboriginal natives, far inferior to the New Zealanders in arms and warlike qualities, and I reflected on the inutility of fiscal arrangements, should our settlers be similarly destroyed. The colonists' houses being generally of wood, and scattered over the country in the most unguarded manner, there was absolutely no kind of security against fire and plunder; except the influence of respect and good feeling, of friendship and self-interest. But this would have ceased at once had a serious dispute, or an act of decided injustice on the part of the government taken place. Even now, with ships of war and troops at hand, the security of the settlers is very precarious, depending entirely on contingencies which cannot be foreseen."

That the New Zealand Company had used every exertion to bring censure and obloquy upon Governor Fitz-Roy,* as they had formerly done upon Governor Hobson and Acting-Governor Shortland, there can be little doubt. Their influence was employed in so systematic and organized a manner, that, directed to a right end, it might have produced great good, instead of being made the means of perverting truth and circulating falsehood. Captain Fitz-Roy, in a dispatch dated October, 1845, says, "as it appears certain that the combined efforts of persons interested in the New Zealand Company have injured me most deeply, I may remind your lordship that three, if not four, colonial newspapers are violent advocates of that company; that the statements of those papers, *known in the colony to be false*, are repeated with various exaggerations in London newspapers; and that ever since I was found to be sincere in my endeavours to act honestly towards the natives, for the safety of the settlers, as well as from principle, there has been an unceasing

endeavour to make me resign, or get me recalled."†

In the spring of 1845, the Company made a desperate effort to reopen a negotiation with the government, and on the 1st of May the directors, as a preliminary step, adopted a resolution to the effect that this court, being "sensible of the extreme delicacy and importance of the present position of the Company's affairs, deems it advisable that the practical proceedings now to be adopted, should be entrusted in a spirit of unlimited confidence to a small number of its members. That the undermentioned gentlemen be therefore appointed a secret committee, with full authority to conduct and conclude any arrangement which they may deem most expedient, namely: Mr. Somes, M.P. (Governor); Mr. Aglionby, M.P.; Mr. Buller, M.P.; Sir Isaac Lyon Goldsmid, Bart.; Lord Ingestre, M.P.; Mr. Lyall, and Mr. [Edward Gibbon] Wakefield."

The secret committee proposed to the government on the part of the Company a project which they afterwards described "as an endeavour, by a change of system, to render needless any direct decision on the precise points of previous controversy; and by means of a large and bold policy, to reconcile satisfactorily the interests of the natives, the colonists, the missionaries, and the Company, and to put matters on an entirely new and sound footing, without compromising the honour of the government. The mode in which it proposed to effect this was by erecting a New Province, comprising the middle and a portion of the northern island, and *conferring the government of it upon a new company (in which the present company was to merge).*"‡

This proposition was rejected by her Majesty's ministers, who, however, intimated, that if the New Zealand Company had any other to offer, founded upon a *wholly different principle*, for relieving themselves, the colony, and the government from the embarrassment consequent upon the present state of their affairs, the discussion of it would be entered upon with an earnest desire to find a satisfactory solution of ex-

* Among the many complaints urged by the company against Governor Fitz-Roy in their petition of April, 1845, was that of his having issued an "inconvertible currency in notes for very small sums." At least he had not been the first to introduce a paper currency into the colony, since their own payments in the New Plymouth settlement, if not else-

where, had been constantly made in debentures varying in value from 8d. upwards, which were nothing more than written scraps of paper issued by the agent. Many of these were lost.

† Parliamentary Papers, New Zealand, 1846.

‡ Eighteenth Report of the New Zealand Company, p. 11.

isting difficulties.* Here the matter ended for the time, the company not choosing to offer any proposal calculated to confer on them a diminished monopoly. In the following July we find them again soliciting from the government an arrangement of their land claims, and a fresh loan of £150,000, to enable them to resume their "colonizing operations." These requests were urged in separate communications. To the first Lord Stanley, through Mr. Hope,† gave a decidedly favourable reply; though not to the extent of the Company's demands: since his Lordship repeated his previous declaration, that he could not, "on any account, agree to guarantee to put the Company (forcibly, if necessary) in possession of lands owned by others; or to compel the original possessors to surrender their acknowledged property." With respect to the decisions given by Commissioner Spain in his judicial character, or delivered by him as an arbitrator, whose adjudication had been authorized by the representatives of both parties, Lord Stanley expressed his opinion that "possession of the land included in such award or arbitration should be given to the Company," but beyond this limit compulsory proceedings against the natives would not be sanctioned. Mr. Hope goes on to state, that with respect to the proposed settlement at Otago, the governor of New Zealand should be at once instructed to make to the Company an unconditional grant of the 400,000 acres they had there purchased, excluding that reserved for the natives; the Company engaging, within a limited period, to select the 150,000 acres proposed, and also such further quantities as they might desire, and reconvey the remainder to the Crown.

The application for the loan was, as usual, founded on the expenses and losses of the Company, which were adduced as forming a valid claim on her Majesty's government. Lord Stanley, in his reply of the 30th of August, 1845, refused in the most unequivocal manner to admit or recognise any such claim. But on considerations of general policy, and principally on account of the large body of her Majesty's subjects, who had expended much of their own capital in forming settlements in full reliance on the continuance of the Company's opera-

tions, her Majesty's ministers agreed to recommend Parliament in the ensuing session to grant a loan of £100,000 for seven years to the New Zealand Company, to be applied solely to satisfying and purchasing native claims, and for surveys and surveying staff. The lands of the New Zealand Company were to be mortgaged to the Crown, which mortgage might be foreclosed at the end of seven years; interest to be paid at the rate of three per cent. per annum. The extra £50,000 asked by the Company for the "completion of the engagements entered into with the settlers at Nelson, for expenditure on religious and educational purposes, and for steam navigation," was refused for the very sufficient reason that the Company was bound to satisfy those claims from their own resources.

This loan of £100,000 was, however, "accepted without hesitation," and the Nelson settlers, to whom the Company acknowledged they were indebted £50,000, were, to use a nautical phrase, "thrown overboard;" yet, not three months before, the directors had paraded their preference of honour to profit, and their resolution "to forego rather the certain prospect of immediate pecuniary advantages than to purchase that advantage by the sacrifice of the colonists" they had been the means of planting in New Zealand.‡

While these negotiations were carried on between the government and the Company, open hostilities were being waged in New Zealand. Troops were sent from Sydney, and Heké and Kawiti were twice defeated (in June and April); but their strength and bravery had in both instances been greatly underrated, and although successful in the main, an unexpected loss of life was incurred by the British troops.

When the report first reached the colony that Governor Fitz-Roy was recalled, it was rumoured that "her Majesty would send a very different kind of man to govern New Zealand—one who would soon teach the natives to know their proper place."§ Official intimation of his recal was not received by the governor until September. The gentleman appointed in his stead was Captain (now Sir George) Grey, who was summoned from the government of South Australia, a colony whose affairs he had ad-

§ Final Report of the Chief Protector of Aborigines.

ministered during a very critical period with singular ability and success, who had deeply studied the character and capabilities of the Aborigines of Australia, and whose name it will be remembered has been mentioned in describing the progress of discovery and exploration in that vast island-continent.

Great excitement prevailed among the Maori population on hearing of the supercession of Governor Fitz-Roy, and its reputed cause, and a considerable number of friendly and influential chiefs proceeded to Auckland, to learn from his own lips the true state of the cause. He used his utmost influence to dispel their apprehensions, and assured them, with a generosity which, under the circumstances, it would be difficult to praise too highly, that if he had been permitted by her Majesty to choose a successor, whose administration he thought would be just and equitable towards the natives, and studiously attentive to their interests, his choice would have fallen upon Captain Grey; than whom, judging from what was publicly known of him, no one could be better qualified for the government of New Zealand.

The new governor arrived in the middle of November, and on the 18th was duly installed. Money and troops to a considerable extent were at once placed at his disposal, his salary as governor was fixed at £2,500 per annum, and almost unlimited confidence was reposed in him.

It is no disparagement to the indisputable merit of Captain Grey, and it is but bare justice to Captain Fitz-Roy, to call attention to the different position of a governor with money, abundance of troops, and a personal income of £2,500 per annum, to that of another without money, almost without troops, and with the confessedly insufficient income of £1,200 per annum, which meagre sum could have been but irregularly paid, the salaries of all the officials, from the highest to the lowest, being, at the period of his assuming the reins of office, considerably in arrears.*

* In a debate in the House of Lords, 1st of March, 1848, Lord Stanley described Captain Fitz-Roy as having "found himself called on to legislate between a warlike and active population, armed with their rights, and familiar with their laws, numbering 120,000 soldiers, at the lowest calculation, on the one hand, and, on the other, a scattered European population of about 12,000 persons, distributed over seven or eight settlements, 500 or 600 miles between each settlement, and without soldiers, or almost without soldiers. On Captain Fitz-Roy devolved the task of preserving peace and preventing the annihila-

Governor Grey used the means entrusted to him with prudence and success—Governor Fitz-Roy had them not, though he saw and declared them from the first to be absolutely essential to an efficient administration, the want of them compelled him to resort to measures which he would otherwise have zealously eschewed. Too true a Christian, too brave a sailor, and too honest a man, not fully to appreciate the evils inevitably attendant upon a temporizing and apparently vacillating policy, he was yet driven into its adoption, by the state of anarchy and bloodshed which threatened to overwhelm the colony. What else could he do? He had no troops to overawe the natives—no money wherewith to confer upon them those substantial benefits which would have effectually secured the allegiance of this brave, intelligent, and, to a great extent, civilized race, at little cost, even in a pecuniary sense, without involving the sacrifice of a single life. Had but one-tenth the money since expended on military defences and actual warfare been invested by government in the fair purchase of land from the natives, and in direct measures for their benefit, even the dealings of the New Zealand Company would have been insufficient to provoke them to hostilities. The much talked-of native reserves had been nominally vested by Governor Hobson in the bishop, the chief justice, and the chief protector, but no available fund appears, up to the recal of Governor Fitz-Roy, to have arisen from them, for the local ordinance brought forward by him, empowering the trustees to act on behalf of the natives, without which no proceedings could have been legally taken in respect to leasing or otherwise obtaining any revenue from them, had not then been confirmed. Governor Hobson had been very greatly to blame in not adhering to the instructions strictly enjoined upon him by the home government, and suffering the surplus of the 15 per cent. upon the produce of the land sales, which was to be appropriated solely for the benefit of the colony by the natives, who regarded the settlers as persons who had encroached on their dearest rights. It was less difficult for Captain Grey, and it was less merit to him that he should have surmounted these difficulties with increased means at his command. It was not fair to visit Captain Fitz-Roy with censure, because, with diminished resources, he could not do as much. With regard to the colony itself, he believed the error had been that the colonists had underrated the powers, the means and the civilization of the natives."

been nominally vested by Governor Hobson in the bishop, the chief justice, and the chief protector, but no available fund appears, up to the recall of Governor Fitz-Roy, to have arisen from them, for the local ordinance brought forward by him, empowering the trustees to act on behalf of the natives, without which no proceedings could have been legally taken in respect to leasing or otherwise obtaining any revenue from them, had not then been confirmed. Governor Hobson appears to have been to blame in not strictly adhering to the instructions enjoined upon him by the home government, and suffering the surplus of the 15 per cent. upon the produce of the land sales, which was to be appropriated solely for the benefit of the natives, to be swallowed up in the pressing requirements of his general administration. The amount of this surplus (£4,000) was entered by Mr. Shortland upon the schedule of the debts of the colony, which were to be paid by a vote of Parliament; but this item was struck out by the Commissioner of the Treasury, who refused to recognise it as part of the debt of the colony. The New Zealand Company's reserves* had been a total failure, chiefly from the worthlessness of great part of the tenth or eleventh portions allotted for them [see Div. v. p. 171], but partly also from the general decline of the settlements, and from an ambiguity in the original plan, by which it was left uncertain whether the reserves were for the actual occupation of the natives, or intended to be let to English settlers, and the proceeds to be applied to the maintenance of native institutions. Under these circumstances, the natives naturally asked what benefits, of those held out to them, they had received from British sovereignty. To this Captain Fitz-Roy could only, in reply, tell them of the advantages conferred by the presence of a civilized government, which time alone could teach them to appreciate; but unhappily he could point to no such unmistakable evidence of care for their welfare as would have been afforded

by the erection of an hospital or the establishment of a school. No place of shelter for the natives (excepting one small building at Nelson) had then been erected out of the colonial funds, nor had any contribution been made towards the erection of a church for the Aboriginal population. The Church and Wesleyan societies were left alike by government and (as Mr. Coates and the Rev. J. Beecham had predicted) by the all-promising New Zealand Company, to pursue unassisted the labours to which both parties were so materially indebted; and to the missionaries the natives turned as to their only disinterested advisers. The influence of the Chief Protector, Mr. Clarke, who had lived among them for twenty-three years, and his son, was doubtless considerable, and of their assistance, as well as that of the missionaries, Governor Fitz-Roy wisely availed himself, in the endeavour to hold his ground during a most critical period. His own unimpeached integrity of character† gave him great weight in the eyes of the natives, and contributed mainly to the efficacy of the "moral force" by which he was enabled to ward off for a time impending danger.

Had he fanned the flame as he was urged and goaded to do by many of the infatuated settlers, instead of using every exertion to smother it, even though conscious that in doing so, he was compelled to adopt measures, the motives for which being misrepresented, would probably cost him character and position—his successor would probably have found on his arrival more deaths to avenge, than lives to preserve.

ADMINISTRATION OF GOVERNOR GREY.—The new governor at once perceived the deeply-rooted anxiety concerning the intentions of the British government with respect to the land question, which, notwithstanding the zealous and disinterested exertions of Captain Fitz-Roy, prevailed even among the most friendly and influential of the Maori chiefs. He took the only means of calming their excitement, by assuring them, "in the most public manner, in the strong-

* "It appears that in some instances the native allotments included or might have included, a desirable water frontage, the prospective value of which must be sufficiently obvious. Some of these native allotments it has been found expedient to exchange against mountain tracts, which, the Parliamentary Committee were informed, are equally valuable to the natives."—*British Colonization of New Zealand*, by the Committee of the Aborigines' Protection Society, p. 8.

† In his private capacity, the good done by Captain Fitz-Roy under most unfavourable circumstances, and with limited means, was acknowledged by all parties, and he was zealously assisted by Mrs. Fitz-Roy. A well-informed colonist, writing from Auckland in 1844, says, "Mrs. Fitz-Roy is establishing various schools and other useful and charitable institutions in the settlement, and she is doing it in such a manner as not only to benefit the poor, but also the higher classes, by enlisting in the same cause all the other ladies of the settlement."—Dr. Martin's *New Zealand* p. 214.

est terms, and on repeated occasions," that he "had been instructed by her Majesty, most honourably and scrupulously to fulfil the terms of the treaty of Waitangi."* Very shortly after his installation, he repaired to the Bay of Islands, to ascertain whether Heke and Kawiti would accept the terms of peace which had been offered to them, and to institute, on the spot, a careful inquiry into their real objects and intentions, as also into those of the other chiefs. He found the disaffected natives to consist of two classes, namely, those who had been actively engaged in hostilities, and those who, under the guise of neutrality, were quietly awaiting the event of the contest, intending ultimately to side with the strongest party. This state of things was at once changed, by the declaration of the governor, that he would not recognise neutrality on the part of any chief, but that whoever failed to come and see him, and refused to afford him any assistance he might require, or information on the state of the country, would be considered and treated by him as one of the rebels. Upon this intimation, all the neutral chiefs, with two exceptions, waited upon him, and gave assurances of their loyalty. Heke and Kawiti, however, returned unsatisfactory replies to the communications made to them, and military operations were recommenced.

In the beginning of December the governor returned to Auckland. His first measures were to refuse to permit the sale of land, by waiving the Crown's right of pre-emption, as his predecessor had done in special cases, and to introduce an ordinance to prohibit the importation, and regulate the sale, of arms and warlike stores in the colony. He then enrolled a native corps, under the direction of British officers, consisting of sixty men, each of whom was to receive rations and ten shillings a month as pay. He also appointed some of the chiefs native magistrates, with a salary of about £20 a-year, paid monthly; chiefs serving as non-commissioned officers to receive additional remuneration. Having made these arrangements, he proceeded in the East India Company's ship, *Elphinstone*, to the Bay of Islands, where he found H.M.S. *Castor*, *North Star*, *Racehorse*, and *Osprey*, at an-

* Governor Grey to Earl Grey, Dec. 10th, 1845.

† Colonel Despard, who commanded the troops, declared that the extraordinary strength of the place, particularly in its interior defences, far exceeded any idea he could have formed of it; every hut was a complete fortress in itself, being strongly stockaded

chor. The seamen and marines from these vessels increased the force available for inland warfare to 1,100 men, exclusive of the native allies, many of whom, but especially Walker Nene, and his brother, Timotiu, Ripa, Macquarie, and Nopera (Noble), distinguished themselves by indefatigable zeal and courage. After some skirmishing, Heke and Kawiti were finally shut up in the pah belonging to the latter chief, at Rua-peka-peka. A company of the Royal Artillery, which had been sent from England, had not arrived; but some of the ships' guns were dragged, with great labour, through the woods and swamps.

The first days of 1846—the seventh year since the establishment of the colony—were spent by the troops in front of Rua-peka-peka. Batteries were erected at the distance of 160 and 365 yards from the pah, and on Saturday, the 10th of January, a constant fire was kept up for several hours, which succeeded in breaching it, though with little, if any, loss to the enemy, who had formed bomb-proof excavations, in which they were safe both from shot and shell.† Walker Nene and other natives, aware of the strength of the pah, entreated the British, in the most urgent manner, not to persist in their attempt to take it by assault, as even in the improbable event of their succeeding, it must be at a heavy cost of life on both sides, but to wait until the ensuing morning (Sunday), when the enemy, not anticipating hostilities, might be easily surprised. The result proved that he was right in his conjecture; but it is not possible, even under the peculiar circumstances of the case, to avoid expressing regret, that the belief in the sanctity of the sabbath, so markedly evinced by the natives, was not respected by their Christian opponents.

Nene, accompanied by two or three other natives, approached the pah in the morning, and found it empty. A signal was made to the nearest stockade, and Captain Denny, with the grenadier company of the 58th regiment, immediately effected an entrance, and was supported by troops and sailors, who rapidly poured in through the breach. The insurgents were on the outside of the pah, and behind it, some occupied in preparing food, others in celebrating divine service all round with heavy timbers sunk deep in the ground and placed close to each other, few of them being less than a foot in diameter, and many considerably more, besides having a strong embankment thrown up behind them.—Parliamentary Papers on New Zealand of June, 1846; p. 9.

vice. Notwithstanding this surprise, they made a desperate attempt to retake the pah, but were repulsed with loss. That of the British amounted to twelve killed and thirty wounded, the greater part of whom fell while rashly pressing on the natives in their retreat through the forest.* Heke, Kawiti, and their followers, after the destruction of their chief stronghold, suffered greatly from the want of provisions, and shortly after entreated Walker Nene to negotiate on their behalf with the governor for peace, on any terms, offering to give compensation in land for their past offences. The fact of Walker Nene's coming forward as mediator was peculiarly opportune, because, according to Governor Grey's despatch, 22nd January, 1846, some indefinite promise had been made to him, and to other friendly chiefs, that their services to the British government should be rewarded by the grant of land to be confiscated in punishment of the rebellion of its native owners. This arrangement Governor Grey considered that he could not conscientiously carry out: he therefore informed Walker Nene that he and his associates must forego any claims they might have upon the lands of the rebels, arising from promises previously made to them by the local government. In a subsequent despatch (26th January, 1846), in detailing, at some length, his views on the subject, the governor says—"I therefore resolved frankly to tell Walker Nene, that I would at once give the rebels a free pardon, and that I would not fulfil my predecessor's promise of dividing the lands forfeited by the rebels amongst the loyal natives; because I believed that my doing so would be injurious to the reputation and interests of himself and the other friendly chiefs; for that the moment I adopted such a course, every one would cease to believe that the loyal natives had been contending for the re-establishment of peace and good order, and would think that their real object had been to obtain possession of the lands of others. I, moreover, pointed out to him, that if I did bestow these lands upon the friendly chiefs, the war must become one of utter extermination; because there could be no doubt that, so soon as the

British force was withdrawn, the original possessors of these lands would attempt to recover them by force of arms, and that it would, moreover, be impossible so to divide it, as not to give rise to quarrels and feuds amongst the loyal chiefs themselves. I added, that in order that it might be clearly seen that I did not refuse to give the lands to the loyal natives *from a desire to obtain them for the Crown*, I would give a free and unconditional pardon to the rebels, leaving it to her Majesty to determine in what manner the services of the loyal natives should be rewarded; and I asked him to explain these my intentions and my views to the other chiefs." Nene† cordially, and without hesitation, assented to the justice of this reasoning. The governor then accorded a free pardon to all concerned in the late hostilities, and soon after sailed to the southern settlements, where the Maories were maintaining a species of guerilla warfare against the settlers, especially those who had established themselves in the upper part of the valley of the Hutt.

Her Majesty's steam-frigate, *Driver*, the first vessel of that description which had visited the Australasian colonies, anchored in Port Nicholson in the afternoon of the day on which the governor arrived in H.M.S. *Castor*. The colonial government brig and the *Slains Castle* (transport) followed, likewise bearing troops, and increasing the disposable force to nearly 1,000 men. Several influential chiefs of the Middle Island at once expressed their intention of maintaining the cause of the government; and Puaha (the Christian chief, who played so conspicuous a part in Mr. Tuckett's narrative, and of whom Governor Grey makes very favourable mention) travelled all night, in his anxiety to embrace the earliest opportunity of tendering his allegiance to the Queen's representative. Te Rauperaha likewise waited upon the governor; both he and Ranghiaiaata expressed their willingness to assist in expelling the natives from the valley of the Hutt, which the governor, (considering the claims of the New Zealand Company to have been fairly established,) had given the natives notice to evacuate by a certain day. They agreed to this, but the cost of a wheat mill, for the use and benefit of Heke, to whom he said, "I do this to convince you that I am your friend, and was so when I took up arms against you. Is it not a good thing to have white men here, who teach us to grow wheat and have mills, and live in peace with the white men and among ourselves?"

* *Sketches in New Zealand*, by W. Tyrone Power, D.A.C.G.; introduction, p. 41; and *Annals of the Colonial Church of New Zealand*, p. 207.

† Nene has recently given a noble proof of his disinterestedness by relinquishing all immediate benefit from the royal grant made to him in acknowledgment of his services, and appropriating it to defray

demanded payment for the huts and crops (amounting to nearly 300 acres of potatoes) which they must leave on the land. The governor refused to enter into this question until the Europeans should have been suffered to take peaceable possession.

Intimidated by the unexpected presence of so large a force the majority of the natives gave way, and of the three hundred fighting men who had occupied the disputed territory, all but about twenty speedily removed from it with their families and properties. Those who remained were most daring in their conduct: they took up their position among the wooded hills, where they appear to have been soon joined by others, and on one occasion, having succeeded in passing the troops in such a manner as to escape detection, they plundered sixteen or seventeen of the houses of the settlers, and then suddenly retired to their fastnesses, whither it was worse than useless for British troops to follow them.*

The strength of these retreats, and the judgment exercised by the natives in selecting and fortifying them, may be illustrated by the following account of one near Wellington, which was visited after its abandonment by the natives.

The forest which had been held by the enemy was traversed by a single narrow path, almost impassable for armed Europeans. This path ascended a narrow ridge of rocks, having a precipice on each side covered with jungle. The ridge of rocks was so narrow, that only one person could pass along it at a time, and it led to a hill with a broad summit, upon which a fortress had been constructed in such a manner as completely to command the path, which was rendered more difficult by an abbatiss placed across it. The rear of this position was quite as inaccessible as its front, and on each flank was a precipice; from the number of huts placed upon it, it must have been occupied by from 300 to 400 men. Altogether Governor Grey described it as the strongest position he had ever seen in any part of the world. In the beginning of April, (1846,) a barbarous murder was committed by some of the natives under the protection of Ranghiaiaata, who refused to give them up, and began to evince open hostility to the government. Ambitious of the fame acquired by Heke and Kawiti in the north, he busied himself in the construction of a pah, from whence he boasted

* Governor Grey's despatch, March 8th, 1846.

British troops and artillery would be necessary to drive him, which was eventually the case. Rauperaha continued to profess friendship, but there were circumstances in his conduct which inspired doubts of his sincerity. The governor had desired to delay the commencement of field operations until the summer weather; but the repeated outrages of the natives defeated this intention: he therefore sent round troops to occupy and fortify the point at Porirua (see map of New Zealand), and commenced opening out communications with the interior, a measure which the unfortunate position of Wellington, hemmed in by forest-covered mountains, rendered necessary for military as well as agricultural purposes. The rebels, though still in arms, at first offered no interruption to the formation of the roads (on which a large number of the friendly natives were engaged), and ceased to molest the settlers, but this calm was of very brief duration. Half-an-hour before sunrise, on the 16th May, a party about 200 strong, led by a Wanganui chief, named Mamaku, unexpectedly attacked a non-commissioned officer's guard, in front of a military post stationed in the valley of the Hutt. The men composing the guard were surprised and slain, after having given great proofs of personal gallantry. Another affray took place in the following month between a detachment of forty men under the command of Captain Reed, and a party of the rebels, of whom Ranghiaiaata was the principal leader, in which the British were again compelled to retreat.

Encouraged by these successes the rebels assumed a most contemptuous tone, and the parties from the interior who were proceeding to join them, as well as those from other parts of the islands, were so elated that the necessity for decided and speedy measures became urgent, not only to discourage the disaffected, but to inspire the native allies more fully with that confidence which they were rapidly losing.† The vigorous steps adopted were successful, and were happily attended with comparatively little bloodshed. The ships of war hovered upon the coast, the soldiers and marines were stationed at favourable points, while the friendly natives pursued Ranghiaiaata into the fastnesses whither Europeans could not penetrate. The suspicions which had for some time been entertained of the treachery of Te Rauperaha having been confirmed through a

† Governor Grey's despatch, July 21st, 1846.

letter addressed to him by some of the disaffected chiefs, who therein apprised him of their intention of joining him, it was determined to seize him by stratagem. To lull the suspicion of the wary chief, the governor, after an interview with him, left Porirua in H.M.S. *Driver*, but returned quietly about two hours before daybreak on the following morning. The boats' crews, under the command of Captain Stanley, of the *Calliope*, supported by a company of soldiers from the camp at Porirua, stealthily approached the pah, and guarded its different entrances, while Captain Stanley, with a party, dashed in to seize Rauperaha. The old chief,* roused suddenly from sleep, did not suffer himself to be captured without a vigorous struggle: he was at length secured, and, together with four other chiefs of inferior rank, conveyed on board a ship-of-war, where he was detained ten months a prisoner. At the expiration of that period, it being found impossible to obtain the evidence considered necessary to prove his guilt, and a large portion of the natives asserting their belief that his alleged continued detention was a mere blind made use of by the authorities, who were ashamed to confess that they had put him to death, it was deemed advisable to release him at the urgent solicitation of his relations, as also of Walker Nene and Te Whero-where, who pledged their words for his future good conduct.†

The unexpected capture of Rauperaha appears to have struck terror into the natives; and the *Ngatitoo*, his own tribe, to prove their fidelity, volunteered to assist in attacking Ranghiaiaata, and actually did take the field, though, according to Power, it was a matter of great doubt which side received most benefit from their services. The result, however, was the dispersion of the disaffected natives, and the capture of several of their chiefs. Ranghiaiaata, though, like Rauperaha, far advanced in years, persisted to the last in defending his pah; when at length compelled to quit it, he contrived to elude pursuit, but was reduced to the condition of a fugitive, nearly the whole of his followers having, at least for the time,

* Power describes Rauperaha as a small man, with a spare wiry frame, possessed of great muscular strength and activity, notwithstanding his advanced age, and adds, "he says himself, that he was a boy when Cook visited the country; which would make him upwards of eighty years of age."—*Sketches in New Zealand*, p. 51. Mr. Tuckett speaks of the extraordinary length of the teeth of Rauperaha, as

deserted him. A court-martial was held at Porirua to try the prisoners, some of whom were transported to Van Diemen's Land, from whence they were at a subsequent period permitted to return. One, however, said to have been the brother of Ranghiaiaata, and a chief of considerable influence, was tried and found guilty upon two counts, the first charging him with having been engaged in the attack on the troops on the 16th of June, and the second with having been taken in arms against the peace of the Queen, and with having joined the rebels under Ranghiaiaata. Sentence of death was pronounced against him, and he was hanged.

This circumstance is noticed in the *Annals of the Diocese of New Zealand*, p. 210, and in the *Colonial Intelligencer* of August, 1847, vol. i., p. 91: an extract recording the particulars of the execution is quoted from a local paper entitled the *New Zealand Chronicle*, and the sentence is commented on as of unwarrantable severity. In the despatches of Governor Grey, published among the parliamentary papers of that date, no allusion is made to the matter, neither have I been able to trace from any source the reason of this man's having been selected for an example, though it is most probable that he must have been distinguished from his companions by some special act of violence or aggression.

Military reinforcements were despatched to New Zealand, in conformity with the opinion of Governor Grey. Captain Fitz-Roy had been considered as over-rating the necessities of the colony, in requiring the presence of two regiments of the line (2,000 men), and an armed steamer. Governor Grey, after visiting many portions of the islands, recommended that the troops should be increased to 2,500 men, and stated (May, 1846), that upon the arrival of a sufficient military force, the naval force might possibly be reduced to one steamer and one vessel of war; but he fully agreed with his predecessor that the presence of a steamer would be always indispensable.‡ The Secretary of State for the Colonies, in reply, informed the governor, that her Majesty's ministers being unable to supply the whole one of the few manifestations of age observable in him. Another personal peculiarity which distinguishes the old chief, is that of possessing six toes on each foot.

† Governor Grey's despatch, July 6th, 1847.

‡ Parliamentary Papers on New Zealand, published January, 1847; p. 16.

of the required reinforcement from the regular army, a part of it would consist of a force of a different description, to be designated the Royal New Zealand Fencibles, and to be composed of six companies, including in all about 500 men, to be selected from the discharged soldiers of the British army, either with or without pensions. These men were to be established, with their families, in villages prepared for their reception, each one to have a cottage or hut ready for him, and an acre of land, of which one quarter was to be cleared, with an assurance of regular employment at fair wages:—to be liable to be called out in a military capacity only, for the preservation of the public peace, within the district in which the company they respectively belonged to should have been formed, or in districts immediately adjoining.*

An important feature of the early part of Governor Grey's administration was the abolition of the protectorate department. Concerning the expediency of this measure, very different opinions have been entertained; some considering the office of protector of vital importance, others deeming its existence an anomaly, which could not too soon be extinguished, as the governor being alike the ruler of all British subjects, whether colonists or natives, ought equally to be the protector of both races. In justice to the gentlemen who had filled the arduous duties of protectors of aborigines, and in proof that no imputation rested on their characters, it should be stated, that the chief protector (Mr. Clarke), was offered the position of native secretary, an office created in the place of that of chief protector, while the subordinates in his department were offered employment as clerks or interpreters, as vacancies occurred. Captain Fitz-Roy has borne high testimony to their services, declaring that their knowledge of native usages and language, and their personal influence among the aborigines had enabled them to allay many a fast increasing feeling of vindictive anger, and to prevent many a serious quarrel; he adds, "they were the eyes and ears of the executive authorities at each settlement."

In his final report, dated March, 1846, Mr. Clarke states one especial instance in which the British government had imper-

fectly discharged their obligations to the New Zealanders. He says,—

"The natives, as if to try what government would do for them in their new relationship as British subjects, speedily brought forward their quarrels and disputes with each other, respecting their landed possessions, expecting assistance and protection; but they soon found that these were questions about which the government took little or no interest; and that so long as their intestine broils were confined to themselves, and were unattended by injurious consequences to the persons and property of Europeans, they were deemed too unimportant for interference, although known to be the fruitful sources of strife and bloodshed. To the present day there is neither a court to take cognizance of disputes of this nature between different tribes, nor even the probability of the organisation and establishment of tribunals, which could efficiently try and adjust such cases."†

The measures which Governor Grey describes himself to have taken to replace the protectorate department,‡ were in themselves unquestionably judicious, and greatly needed. Savings' banks were established at Auckland and Wellington; means were taken for the crection of hospitals for Europeans and natives at Auckland, Wellington, Wanganui, and Taranaki; a lawyer of ability was engaged as standing counsel, to whom all the natives resorting to Auckland for justice were referred, a fixed fee of £100 a year being paid to him, from funds applicable to native purposes, and a further fee of five per cent. on all amounts which he might recover for them. Peculiar courts, called Resident Magistrates' Courts, were created for the purpose of determining all civil cases involving claims of less than £100 in amount, arising between natives and Europeans. An ordinance was also enacted to prevent Europeans "from abandoning, in a state of utter destitution and misery, their half-caste children, as they were previously in the habit of doing." Governor Grey, in the despatch from which these particulars are taken, alludes, with reason, to the beneficial results to be expected from the extensive employment of the natives upon public roads, by which means they were taught the use of the principal European agricultural implements, the advantages of combined and continuous labour, and were becoming accustomed to a better diet, to better clothes, to discipline, to regular hours of work, and were at the same time opening up their

* Parliamentary Papers on New Zealand, January, 1847; pp. 18—20. Further particulars respecting the military villages and the native militia will be given in the chapters on topography and population.

† Parliamentary Papers relating to New Zealand, published June, 1847; p. 16.

‡ Vide despatch from Governor Grey, dated 4th February, 1847.

country, and insuring to themselves the power of easily transporting their produce to market.

With regard to the annual revenue and expenditure of the colony, Governor Grey gives the following brief estimate in his despatch, dated 12th of May, 1846:—

Probable general ordinary annual expenditure of local government	£27,000
Probable extra expenditure, on account of natives, police, roads, &c., &c.	31,000
Total expenditure	£58,000
Probable revenue from this date, but rapidly increasing in amount	22,000
Immediate annual deficiency, yearly decreasing in amount.	£36,000

The proceedings of Parliament in the session of this and the following year, (1846, '47,) had a very important bearing on the affairs of New Zealand. Before entering upon them, it is necessary to state that at the commencement of 1846, Mr. Gladstone became Secretary for the Colonies, in the stead of Lord Stanley, whose line of policy with regard to New Zealand, he appears to have steadily maintained. In the ensuing June another change of ministry took place, and Mr. Gladstone was succeeded by Earl Grey, whose accession to office was hailed by the New Zealand Company with extreme satisfaction, his opinions being known, to be far more favourable to that body, than those of either of his predecessors. A few months before his lordship became colonial minister, we find Mr. E. G. Wakefield describing him as "the statesman who has most completely mastered the subject of New Zealand affairs,"* and the *New Zealand Journal*, the chief organ of the directors, and more especially of Mr. Wakefield, pointed out in the strongest terms the perfect fitness of Lord Grey to grapple successfully with the many difficulties of the New Zealand question. In one article, after passing the highest eulogiums, both on his public and private character, the writer adds, "we believe that his sense of justice and comprehensive sympathies will care for all,—the colonists of Cook's Straits, the more irregular (?) settlers of the northern peninsula, the deluded land-jobbers of Auckland—last, though not least, the natives. We have confidence in his ability to reconcile their seeming jarring and conflicting interests, and in his energy to carry through

* *Vide* Twentieth Report of the Directors of the New Zealand Company, p. 38.

the undertaking. The national councils, so long as he remains in them, will not be disgraced by that perverseness and paltriness which have exposed the settlers in New Zealand to be duped and plundered by savages, and insulted by swindlers in office."†

This extract may serve as an illustration of the spirit of factious opposition, and of the grossly disrespectful tone still maintained by the directors of the Company towards the authorities, both at home and in the colony, and likewise of the ill-disguised hostility evinced towards the "savages," whose first and great offence consisted in not quietly submitting to be "duped and plundered" of their lands. It is likewise important that the strongly and publicly expressed opinions, both of the Company and of Mr. Wakefield, concerning Earl Grey, should be borne in mind, because the final failure of the Company has occurred during the administration of the very minister whose accession to office was hailed as its surest harbinger of success.

During the session of 1846, an act of Parliament (9 & 10 Vict. c. 184, sec. 11,) was passed by the Imperial Legislature, for the better government of New Zealand, under the authority of which a charter was issued for the introduction of a new constitution, under which the colonists should enjoy the privileges of representative institutions. The following abstract of the chief objects contemplated by the charter, is given in Earl Grey's dispatch to Lord Grey, of 23rd December, 1846:—

"For the institutions established under the charter of November, 1840, it contemplates the substitution of municipal corporations for the government of each separate district of New Zealand, which is or which shall be settled by colonists of European birth and origin. Every such district is to be erected into a borough; every such borough is to elect a common council, from which are to be chosen a mayor and a court of aldermen; every such common council is to elect members to serve in a House of Representatives, forming one of the three estates of a Provincial Assembly. For this purpose the whole of New Zealand is to be divided into two or more provinces. In every such Provincial Assembly, laws will be made for the province by the House of Representatives, by a Legislative Council, and by the governor, who together will constitute the Provincial Legislature.

"But as there are many topics of general concern to all the inhabitants of New Zealand, respecting which some uniformity of legislation and of administration will be indispensable, it is further provided, that a general assembly of the New Zealand Islands

† *New Zealand Journal*, No. 156 December 20th, 1845; p. 313.

shall be holden by the governor-in-chief. That General Assembly will be composed of himself, and of a Legislative Council, and of a House of Representatives. But no one will be a member of the Legislative Council of the General Assembly who is not also a member of one of the Legislative Councils of the Provincial Assemblies; neither will any one be a member of the House of Representatives of the General Assembly who is not a member of one of the Houses of Representatives of the Provincial Assemblies.

"In order to adapt the system of the local executive government to this scheme of provincial and general legislation, the charter (if the mere text of that instrument be alone regarded) provides for, and supposes, the creation of five different offices. They are a governor-in-chief of New Zealand, a governor of each province, and a lieutenant-governor of each."

For the present, however, the five offices mentioned at the close of the foregoing paragraph, were to be combined in two persons, the superior remaining with Captain (now Sir George) Grey, and the inferior being intrusted to Mr. Eyre, a gentleman who, like Captain Grey, had won considerable renown as an Australian explorer, and was known to take a deep interest in the welfare of aboriginal races. A letter of instructions, issued under the royal signet and sign manual, appended to the charter, gave copious and detailed explanations of its provisions, and of the manner in which they were to be carried out. The course of policy to be adopted with regard to the land question, was very different to that heretofore followed. Lord Grey enters upon this topic by announcing the repeal of the Australian Land Sales Act, so far as lands situated in New Zealand were concerned, and the consequent absence of any statutory regulations on the subject. His lordship then states that the Queen, as entitled in right of her crown to waste lands in the colony, is free to make whatever rules her Majesty may see fit, and the charter accordingly authorises the governor to take immediate measures for the alienation of such lands, by ordering the registration of the extent and limit of all lands considered as the property, either of individuals, of bodies politic or corporate, or of the native tribes; the whole of the remainder was then to be declared as constituting the royal demesne. No claim to land was to be admitted on behalf of the aboriginal inhabitants, until it should have been proved to the satisfaction of a court to be holden for the purpose,—

"That either by some act of the executive gov-

* Parliamentary Papers, January, 1847, p. 64.

† *Vide* New Zealand Question by L. A. Chame-

ment of New Zealand, as hitherto constituted, or by the adjudication of some court of competent jurisdiction within New Zealand, the right of such aboriginal inhabitants to such lands has been acknowledged and ascertained, or that the claimants or their progenitors, or those from whom they derived title, have actually had the occupation of the lands so claimed, and have been accustomed to use and enjoy the same, either as places of abode or for tillage, or for the growth of crops, or for the depasturing of cattle, or otherwise for the convenience and sustentation of life, by means of labour expended thereupon."

In the above clause there is one point to which it may be well to draw attention, namely, that in which it is laid down, "that the claimants or their progenitors, or those from whom they derived title, have actually had the occupation of the lands so claimed, and have been accustomed to use and enjoy the same," &c. In the charter of 1840, however, in which these words were first employed, they did not stand in conjunction, for clause thirty-seven of that instrument enacted, that "nothing in the said charter shall affect or be construed to affect, the rights of any aboriginal natives of the said colony to the actual occupation or enjoyment in their own persons," &c. An able writer, in commenting upon this apparently trivial distinction, remarks that, "according to the true and general acceptance of the word, 'occupation' may exist in respect of individual right of property independently of enjoyment;" but that "a right of enjoyment is necessarily dependent upon a precedent right of occupation, wherefore, whilst 'occupation or enjoyment,' would leave intact the very amplest construction of the treaty, 'occupation and enjoyment' would limit proprietary rights to a very narrow compass; wherefore the peculiar virtue of the substitution of 'and,' for 'or,' becomes apparent. Occupation is the larger right; enjoyment, the lesser; save definite boundary, occupation or enjoyment imposes no limitations upon proprietary rights; on the contrary, occupation and enjoyment imply a restriction of the greater right by the lesser. The treaty of Waitangi, and the charter of 1840, confirmed and guaranteed the greater right; the charter of 1846, and the letter of instructions, impose the lesser."†

The third and last feature of especial importance in the proposed constitution, refers to the government of the aborigines. In the fourteenth chapter of the Royal in-

rovzow, secretary to the Aborigines' Protection Society, pp. 363, 364.

structions, the governor-in-chief was directed to set apart, as he should see occasion, "aboriginal districts," the limits of which he was empowered from time to time to contract or enlarge, and within which the laws, customs, and usages of the Maories, so far as they were not repugnant to the general principles of humanity, should be for the present maintained, under the authority of native chiefs or others to be appointed or sanctioned by the governor-in-chief.*

Until further orders should be given, the three islands of New Zealand were to be formed into two provinces, to be called "New Ulster" and "New Munster;" the former to comprise the whole of the Upper or Northern Island, except such parts adjacent to Cook's Straits (Wellington, Wanganui, &c.) as the governor-in-chief might exclude; the parts so excepted, together with the Middle and Southern Islands, to constitute "New Munster." Each province was to have an executive council (composed of the colonial secretary, attorney-general, colonial treasurer, officer in command of the troops, and such other persons as may be deemed necessary,) to aid with their advice the administrator of the government.

The constitution bears internal evidence of the care and labour with which it had been prepared, but it was not the less grounded on a mistaken view of the actual and immediate requirements of the population generally, both European and native. To the former it conceded more than the majority of them desired, or were, in fact, in a position to receive; while it indirectly

* This plan of "aboriginal districts" bears some resemblance to one propounded by Mr. E. G. Wakefield, in an extraordinary and most mischievous letter, addressed by him to Mr. Gladstone, when colonial minister (21st January, 1846). It is very painful to find so high an authority as Earl Grey unquestionably is on colonial matters, even apart from his position in the cabinet, advocating a measure which those best acquainted with the New Zealanders declare to be, however modified in minor points, calculated to exercise a most injurious effect on the native character. That Mr. E. G. Wakefield, who has not hesitated to describe the treaty of Waitangi as having been "on our part a fraud on the ignorant natives, and a sham towards more intelligent people," should advise that beyond the limits of certain municipalities, the *New Zealand savages should be allowed to follow their own devices in a lawless territory whither no colonist of ordinary prudence would venture, because the protection of British law would in no case be extended to them, and which would, as he foresees, be preferred "by a lawless class, such as now prowl about these islands, (that is*

excluded the latter from the slightest participation in the legislative privileges so lavishly bestowed upon the white race, by declaring that the elective franchise was not to be exercised "by persons unable to read and to write in the English language;" in other words, that the Maories, of whatever station, influence, and natural ability, were to be allowed to enjoy it only on condition of being able to read and write, not their own, but a foreign, and to them, most difficult tongue.†

The time for promulgating and carrying out the charter was left to Governor Grey, who wisely availed himself of the discretionary power granted him, by delaying its introduction, and lost no time in representing to the home government his reasons for doing so. In several of his dispatches, but especially in that dated the 3rd of May, 1847,‡ the chief objections to the proposed constitution are clearly and convincingly shewn; especially the injustice of giving to a "small fraction" of one race, the power of governing the large majority of another, and of appropriating as they may think proper, a large revenue raised chiefly by taxation from the latter. The governor adds:—

"And these further difficulties attend the question, that the race which is in the majority is much the most powerful of the two; the people belonging to it are well armed, proud, and independent, and there is no reason that I am acquainted with to think that they would be satisfied and submit to the rule of the minority, whilst there are many reasons to believe that they will resist it to the utmost. And then it must be further remembered that the minority will not have to pay the expenses of the naval and military forces which will be required to compel the stronger and more numerous race to submit to their escaped convicts, runaway sailors, &c.) is no great matter of surprise, or even that he should again urge the disgraceful and utterly inexcusable plan of seizing upon the possessions of a noble, intelligent, and improving race, and confining them like wild beasts, within a sort of large lair, viz., the northern part of the North Island, under "a system of separation or anti-colonization," this northern peninsula being, it should be remembered, according to numerous accounts put forth by Mr. Wakefield and his "colleagues in the New Zealand Company," the most barren and uninviting portion of New Zealand.—*Vide Twentieth Report of the New Zealand Company, pp. 37 to 64.*

† Governor Grey, in his despatch of May 3, 1847, says, "that he does not know one native who can read and write the English language, although out of sixty-seven natives who had been employed in the Ordnance Department, sixty-six of them could write their own language, and the whole of them could read it."

‡ Parliamentary Papers on New Zealand, December, 1847, pp. 42—45.

rule, but that, on the contrary, these expenses must be paid by Great Britain.

After adverting to the extent to which the Maories already contributed to the revenue, and the probability that each year, as they continued to advance in civilisation, they would do so still more largely, so that the proportion paid by the European population would form but a small portion of the whole revenue; his excellency proceeds to say:—

"It must be borne in mind that the great majority of the native population can read and write their own language fluently; that they are a people quite equal in natural sense and ability to the mass of the European population; that they are jealous and suspicious, that they now own many vessels, horses, and cattle; that they have in some instances considerable sums of money at their disposal, and are altogether possessed of a great amount of wealth and property in the country, of the value of which they are fully aware; that there is no nation in the world more sensitive upon the subject of money matters, or the disposal of their property; and no people that I am acquainted with less likely to sit down quietly under what they may regard as injustice. A great change has also recently taken place in their position, the mutual jealousies and animosities of the tribes have greatly disappeared, and a feeling of class or race is rapidly springing up. * * * Their intercourse and power of forming extensive conspiracies, and of executing combined and simultaneous movements upon different points is daily increasing. * * * It is, I think, doubtful, therefore, if it would be prudent to hazard the attempt to force upon a nation so circumstanced a form of government which would at the same time irritate their feelings, and I think insult their pride, which there can be no doubt would separate them from the Europeans, placing them in an inferior position as a race, and thus at once create this feeling of nationality, the consequence of which would, I fear, be so hurtful. * * * The foregoing arguments have been applied solely to the great native population throughout the country, and to the general revenue raised from duties of customs; but they apply equally, perhaps even with more force, to the natives who would reside within the limits of boroughs, and who would be subjected to direct taxation, with form of assessments, &c., which, I fear, might often be collected in a manner highly offensive to them, and who would speedily become discontented and exasperated if they had no voice in the subject. The same arguments apply also equally to the naturalized Germans, who are likely to become a very numerous and important portion of the population, and who are at present contented and good citizens, whom I should be very sorry to see excluded from any privileges accorded to the rest of her Majesty's subjects; whilst the inhabitants of the French colony at Akaroa, whom her Majesty's government have directed to be naturalized, will, in like manner, be wholly excluded from any share in the management of their own affairs."

The governor was not singular in his anticipation of the evils which would result from any attempt to carry the proposed

constitution into effect. The bishop and chief-justice, both men of acknowledged ability and high principle, temperately but decidedly expressed their views on the subject; the latter, in the shape of a pamphlet; the former, in the subjoined protest. The pamphlet was printed only for a very limited private circulation, and although referred to in the Parliamentary Papers on New Zealand, bearing date July, 1849, is not, and, I believe, has not since been published, either at home or in the colony; the protest was transmitted to Earl Grey through the governor, by the bishop, who expressly states, that previous to its publication as an official document, few, even of his own friends, knew that it had been written, and not one of the native race.* It could not, therefore, have had the effect, it was from ignorance of the facts of the case, at first asserted to have had, in exciting a spirit of disaffection among the natives.

"St. John's College, Bishop's Auckland,
"July 1, 1847.

"May it please your Excellency,—I, George Augustus, by Divine permission, bishop of New Zealand, on my own behalf, and on behalf of the clergymen of this diocese, employed by Captain Hobson to interpret and explain the treaty of Waitangi to the native chiefs of New Zealand, do hereby record my deliberate and formal protest against the principles expressed in a letter of instructions addressed by the Right Hon. the Earl Grey to your excellency, bearing date, Downing-street, 23rd December, 1846, to the effect that,

"'The savage inhabitants of New Zealand have no right of property in land which they do not occupy, and which has remained unsubdued to the purposes of man.'

"Against this doctrine I feel myself called upon to protest, as the head of the missionary body, by whose influence and representations, the native chiefs were induced to sign the treaty of Waitangi, not one of whom would have consented to act as an agent of the British government, if the assurances given to them by Captain Hobson had not been directly contrary to the principles now avowed by the Right Hon. the Earl Grey.

"It is my duty also to inform your excellency, that I am resolved, God being my helper, to use all legal and constitutional measures, befitting my station, to inform the natives of New Zealand, of their rights and privileges as British subjects, and to assist them in asserting and maintaining them, whether by petition to the Imperial Parliament, or other loyal and peaceable methods: but that, in so doing, I shall not forget the respect which I owe to your excellency, nor do anything which can be considered likely to add to the difficulties of the colony.

"I have further to request, that this communication may be forwarded to the Right Hon. the Earl

* Parliamentary Papers on New Zealand, published July, 1849, p. 37.

Grey, secretary of state for the colonies, with whom I am privileged to communicate through your excellency.

"I have, &c.,

"G. A. N. ZEALAND.

"His Excellency Captain Grey, &c., &c., &c."

The Wesleyan missionaries fully participated in the apprehensions expressed by their brethren of the Church Mission, and their superintendent, the Rev. Walter Lawry, strongly urged the subject on the consideration of the Society in England, who, in consequence, memorialized Earl Grey, as did also the Aborigines Protection Society, in earnest and forcible language.

These various remonstrances were not disregarded, and the result was the speedy passing of a bill to suspend the charter for five years. Meanwhile, a Legislative Council was authorized to be formed at Wellington, for the New Munster province, under the administration of Lieutenant-governor Eyre (who arrived in the colony in 1847); Governor Grey superintending the affairs of the New Ulster province with a Legislative Council at Auckland, and at the same time, fulfilling the functions of governor-in-chief. To have repealed the charter altogether, would have been more satisfactory, as several of the cogent reasons urged against its being brought into operation in 1847, would seem to apply with undiminished force to its probable effect in 1852; meanwhile, the allowing its most obnoxious clauses, especially the one relating to the "settlement of the (so called) waste lands of the crown,"* to remain unrepealed, and only in temporary abeyance,—could scarcely fail to keep the native population in an unsettled and anxious state, calculated to check their advance in civilization, and, by consequence, to retard the progress of the colony. The importance of coming to a decision with as little delay as possible, may be illustrated by the following extract from a letter published in the *Colonial Intelligencer* of December, 1847. The name of the writer is withheld, but it evidently proceeds from some one who, by position and ability, is qualified to offer very valuable testimony:—

"Auckland, 5th July, 1847.

"At present I can do nothing more than advertise you of the critical state of things in this colony; and assure you that it appears to many thoughtful and disinterested men to have become a matter of vital importance to this colony, that the doctrines recently laid down by the colonial minister, in his despatch explaining the new instructions respecting native

* Thirteenth chapter of the Royal Instructions which accompanied the Charter.

titles to land, should be at once and seriously considered in all their bearings.

"For though it may be true that the theory put forth by Earl Grey is regarded by him simply as a doctrine sound in the abstract, yet practically inapplicable to New Zealand, by reason of past avowals here made of the opposite doctrine; and though it may be true that the instructions themselves are capable of being so carried out as to work no injustice, yet it is not less true that *any application* of the theory now propounded must involve a breach of national faith, from which Earl Grey and every nobleman in England would shrink at once, if the facts were clearly before him; and further, that in that breach of faith would lie the necessary loss of our moral influence, and therein of every hope for the improvement and advancement of this people; nay, the certainty of the loss of that hold which our faith and our better usages have already gained upon them. Every thing has been taken by them, of necessity, upon our authority—upon the credit of the Pakeha Teacher's being a true man, seeking the good of those whom he instructs.

"If this new theory were promulgated amongst the natives (as it will be), and believed to be the deliberate mind of the Queen of England (as I trust it never will be) towards them, we should not have one friend.

"The one practical difficulty which every man who has been conversant with the native people has been forced to see again and again, has been the suspicion which the natives have entertained of our intention to act here as they know us to have acted in Australia—a suspicion which a race of shrewd and foreseeing men could not but form. This is the one repelling force, against which it has been necessary to strive constantly. Yet many—very many—especially amongst those who have accepted Christianity, do believe that we mean what we say. In this belief lies all our strength and all our hope. If this spell be broken, our power for good is gone. But that will not leave us in a condition of indifference and repose. At that very point the determination and power of this people for evil will begin. Our settlements are at their mercy. Every month of the last three years has strengthened in them a national feeling, and removed hindrances to their combination against the Pukeha.

"Now this is essentially a fighting people, though the tendency to war has been greatly checked by the progress of the Christian faith, and by a daily increasing sense of the benefits of peace and order. The extent to which that faith has been distinctly and soundly apprehended by these people I do not inquire into now; but thus much is undeniable, that they understand their new faith to be inconsistent with their old system of warfare. So far, at least, the Christian influence has been strongly effective. Yet the old spirit is there, and needs only to be roused, to burn as fiercely as in time past. Any direct encroachment on any territorial right will rouse it. And the important point to remember is this, that the New Zealanders will not stop to ask us to define territorial rights for them nor will they defer to the authority of writers on the *Jus Gentium*. Wherever any benefit to be derived from any portion of the surface of the land has been, by the immemorial usage and habit of the people, appropriated to one set of men (and distinctly guaranteed to them by treaty and numerous assurances), that set of men will never consent to see it taken by any man, by

mere force. Could Englishmen respect them if they would? That such appropriation does exist over the surface of this country is certain. To us here, who move up and down the land, this I say is certain. We need not to ask questions. You hear two natives arguing on some story told, and you find this kind of appropriation to distinct tribes or (*hapus*) sub-tribes, sometimes to distinct families or individuals, implied. We are as much under a physical necessity of knowing this, as some honourable gentlemen at home appear to be under a mental incapacity of conceiving it. But if this theory were to take a material and practical shape in these islands, it would appear not as an encroachment on some slightly important interest, but it would in reality be (however little it may be so conceived at home), in its consequences (and few men are quicker in discerning consequences than the natives), a destruction of their most valuable rights; of rights essential to, under present circumstances, their physical existence. Earl Grey cannot be aware of this; yet a single day's walk in the bush would force upon him a conviction of the truth of what I assert.

"The occupation of these islands by the Maori has been in this fashion. The first immigrants proceeded inland from the sea coast, clearing away the forest before them, and raising their crops upon the soil which, from year to year, was newly cleared. The lands actually cleared are still found to be fringed and bounded by forest land, into which the tribe is still working its way. When you come to the edge of the forest you find a village, generally not a fortified village or pah, but a collection of cottages. The forest recedes, and after a time the settlement moves on. In the tract which the cultivators leave behind them, some villages are retained as strongholds, or for reasons of local convenience, as of sea or river fishing, &c. This tract having been reclaimed by the labour of the present generation, or of their progenitors, or of those through whom they claim, would be saved to the natives by the theory. Yet its value to them is far less than that of the woodland which lies before them, and upon which they have not actually bestowed labour. The former yields runs for their pigs, flax-swamps for clothing and trade, ducks, eels, &c., but the latter is the cover under which the pigs breed: from it they obtain timber for their *pahs* (houses) and their canoes; but, above all, from it they obtain by far the larger part of their daily food. The ordinary mode of cultivation is to burn and fell the forest trees, and to put their seed into the soil upon which the burning has taken place. This portion of the soil is in fact at present the main source of subsistence to this people. It is the staff of their life, the bread which they eat. Yet, as no labour has actually been applied, it is the very part to which the new theory would attach. To claim these lands, and to attempt to enforce the claim, would be in fact (however it may be conceived of by Earl Grey) to declare a war of extermination; for it can never be expected that these people will yield up that which they, by common consent amongst themselves, regard as a matter of property, because they may be informed that speculative writers think otherwise, especially when no compensation is to be offered for what they know to be of the utmost value to themselves. It may be that the serious and explicit avowal of the philosophical claim may be met by the natives with a smile, as a ridiculous pretension of the Pakeha; but if they regard it as our serious determination, there will be

an end of all peace in this land. The colonization of New Zealand will be postponed, to be begun again by another generation. England will have gained only the shame of a failure, caused by our own injustice.

"The good fame of England is worth a struggle. The natural rights of human kind are worth defending. As to this native people in particular, I have neither space nor time (for the post is on the point of closing) to speak minutely. The character they bear in England appears to vary with circumstances. A few years back they were described as a most hopeful—an already half-regenerated race of uncivilized men. Since it was discovered that they did not admit the principle, that men ought to part with that for which they and their forefathers had shed their blood, merely because other persons professed to have bought it, they appear to have lapsed into the class of treacherous and bloodthirsty savages. No doubt there have been good reasons for all this. But speaking of this people as a body, I assert confidently, that British colonization has never come in contact with a race of uncivilized men more capable of improvement, more serviceable or useful, more disposed to repose a perfect confidence in England, or more willing to live at peace, if it be clearly shown that British sovereignty is intended to be (as was promised in the beginning) a source of benefit, as to other British subjects, and not of enslavement and spoliation."

At home, and in New Zealand, all parties concurred in commending the promptitude with which Earl Grey had taken measures to suspend the charter, as being at least a move in the right direction, except the New Zealand Company and a minority of its ill-starred land-purchasers, who had hoped to see "all the treaty of Waitangi nonsense"* swept away by the operation of the proposed charter. Besides the prospect of thus obtaining the object which they have so long and perseveringly sought, viz.—the possession of lands which they had never bought, and the native owners had never sold; there would seem to have been another motive which rendered them particularly desirous for the immediate establishment of "representative institutions," and wilfully blind to the fact that the colonists, neither in regard to numbers or wealth, had attained the position which could alone fit them to enjoy the privileges and bear the expenses of representative institutions. Even in their own settlements there were men who clearly set forth this fact, and did not hesitate to avow that for the present, at least, and until their land-purchasers should obtain legal conveyances, "real or complete self-government would be out of the question. The control exercised by the agent over the fortunes and position of a large number of

* *Vide Spectator*, January 2nd, 1847.

colonists, would render independence inconvenient, confer upon him an influence fatal to liberty of action, and render him the depository of political power." The foregoing words are those of Dr. Monro, one of the most accomplished and intellectual of the fine body of colonists whose confidence in the integrity of the New Zealand Company had been so cruelly abused. He remarks, as a reason for "the extraordinary proceedings of the Company in withholding from us our conveyances, after having promised them up to the eleventh hour and fifty-ninth minute," that,—

"In a settlement already established, such as Wellington or Nelson, with no great field of extension, if conveyances were once issued, the influence of the Company or its Agent would be comparatively trifling. But in any settlement of the Company's in which the purchasers have not yet got their title, in all settlements in course of progress, and throughout the colony generally, if emigration were advancing, the influence of the Company and its agents, wielding the monstrous, unconstitutional, and irresponsible power which the British Parliament, in a fit of insanity, placed in its hands, would be overwhelming."*

The concession made by the government to the New Zealand Company, to which Dr. Monro adverts in such strong terms of condemnation, was the arrangement entered into in 1847, and confirmed by "An Act to promote colonization in New Zealand, and to authorize a loan to the New Zealand Company," who, in the month of April, (having then received £80,000 of the loan of £100,000 guaranteed to them by act of Parliament in the preceding session,) applied to her Majesty's ministers for compensation for the injury which had been done to them by various acts of the government at home, and of the local government of New Zealand. This assertion was supported by statements so plausible, that only those who had followed the Company in all its tortuous windings, and who were acquainted with the systematic perversion of truth, either by the suppression of part of the facts which were assumed to be wholly manifested, or the misrepresentation of them altogether, would be likely to examine their assertions with the searching scrutiny necessary to detect their hollowness. Those, however, who had done so, and who had consequently traced the line

* Vide *Nelson Examiner* of October 26, 1850.

† "The addition to be decided on," is stated in a previous paragraph to be "a large unascertained amount."

of policy which the Company had invariably adopted in each separate transaction with the government, of asking considerably more than even they could possibly expect, would feel no great surprise at finding them request from Earl Grey, in language equivalent to a demand:—"Either the payment of a sum of £225,000, together with the addition† which may be decided on, as the amount of the loss alluded to above, as not yet estimated; leaving the Company's engagements to be satisfied out of these sums and the proceeds of its land. Or, the transfer to the government of the 1,073,000 acres of land to which the Company has at present a right, together with an obligation to satisfy the engagements of the Company as above stated, in this country and in New Zealand."‡

According to the documents which accompanied this extraordinary communication, the expenditure of the Company from the 2nd of May, 1839, to the 5th of April, 1847, exclusive of £41,890 paid to the Company's shareholders, as interest upon its capital, to the 5th of October, 1843, had been as follows:—

Expenditure.	May 2, 1839, to April 5, 1845.	April 6, 1845, to April 5, 1846.	April 6, 1846, to April 5, 1847.	Total.
Home Establishment	£50,106	£4,025	£3,652	£57,784
Emigration.	211,754	635	108	212,498
Colonial.	172,704	29,686	20,163	222,555
Miscellaneous.	133,435	3,183	6,674	143,292
Total	£568,001	37,530	30,598	636,131

Note.—The colonial expenses from April 6, 1846, to April 5, 1847, include £15,000 deposited with Messrs. Overend, Gurney, and Co., to cover the guarantee given by the Company's bankers upon bills to be drawn from the colony by the principal agent.

The shillings and pence having been struck out, leave the totals slightly incorrect.

The above statements shew an expenditure in eight years of £681,021, of which no more than £200,000 had been subscribed by the shareholders. The principal expenditure took place previous to 1845, and amounted to £612,891, or at the rate of more than £100,000 a-year; yet not more than 6,000 persons were provided, during that time, with free passages to New Zealand. On landing, the emigrants had to build their own habitations and clear their own land, that is, provided they were so fortunate as to obtain permission to occupy on suffer-

‡ Letter to Earl Grey from T. C. Harington, secretary to the New Zealand Company, 23rd April, 1847. Parliamentary Papers on New Zealand, June, 1847, pp. 106-7.

ance a sufficient portion to supply their more pressing requirements. The so-called public works (of the Company), in which enormous sums are said to have been sunk, consisted chiefly of bridle-paths through the forest, dignified with the name of roads; and bridges of such imperfect construction, that the first flood swept them away; while any preparation for the observance of religious worship, either in Wellington or Nelson, or even the appointment of a minister of the Gospel, would seem to have been wholly disregarded by the propounders "of one of the greatest missionary projects ever suggested."—(Sec Div. v., p. 147.)

The obligations and engagements of the Company, (in April, 1847,) "exclusive of those to their land-purchasers and shareholders, and of open accounts in New Zealand," are thus stated:—open accounts and contingencies in England, say £10,000; debentures not yet paid off, £54,000; interest thereon, £2,625=£56,625; advanced by her Majesty's government, £80,000;† total, £146,625. In addition to this sum, the directors said they were indebted to the Nelson settlement, £25,000;* to their shareholders, £235,000. Making allowance for some securities and investments, it was announced that "the total of the Company's liabilities may therefore be estimated at £394,000."

The assets set forth consisted of a right to 1,049,000 acres, and 24,000 acres, being the quantity still unsold out of the 1,300,000 acres claimed under Mr. Pennington's investigation in November, 1840, and by subsequent correspondence.

Earl Grey, who appears to have taken a far too favourable view of the proceedings of the Company, received this last proposition in a very different manner to that in which somewhat similar ones had been met by his predecessors—Lord Normanby, Lord Stanley, and Mr. Gladstone. Lord Stanley, indeed, had been sufficiently long at the head of the colonial office, to become conversant with their various schemes and manœuvres, their plots and counter-plots, and, judging from the experience he must have acquired of their past dealings, would probably have concluded, that so far from having any well-founded claim upon the

government for compensation, it was rather a question whether a rigid and searching investigation, ought not to be instituted into the truth of the heavy charges brought against the directors by settlers of all grades who had emigrated under their auspices, and who, having long and vainly sought for justice at their hands, appealed to public opinion and to the legislature of their country.

Extracts strongly corroborative of the deep and general sense entertained by the colonists of Wellington, of the inexcusable injustice with which they had been treated, have been already quoted (Div. v., pp. 162, 175,) from a pamphlet, entitled *A Letter to the Directors of the New Zealand Company, from the land-purchasers resident in the first and principal settlement, claiming compensation for the Company's breach of contract, and calling upon the Directors to fulfil the terms of purchase.* This letter was framed by a committee of gentlemen appointed at a public meeting held on the evening of the 29th of July, 1846, which was attended by nearly every "owner of land-orders in the settlement of Wellington," by whom the following resolutions were unanimously adopted. In reading them, it should be remembered that they are not the opinions of a few individuals, but the common voice of the "first and principal" of those settlers whose interests the New Zealand Company, whether addressing the government or the public, always assumed to be identical with its own, whereas its actual, though not right'ul position, was that of a lawyer, who receives his fees whether his client wins or loses his cause:—

"Resolved, 1.—That the purchasers of land in the New Zealand Company's first and principal settlement have hitherto refrained from pressing their claims upon the Company, in the full confidence and expectation, that the Directors, as soon as they were relieved from the difficulties in which they have been placed, would have adopted immediate measures for fulfilling the engagements entered into with the purchasers of land, and would have compensated them for the loss they have incurred from the inability of the New Zealand Company to complete the contract made seven years ago with such purchasers.

"2.—That the purchasers of land, seeing the disregard of their interests evinced by the directors, in the arrangement recently made† with her Ma-

* When the representation made by the Company to Earl Grey, estimating its liabilities to the Nelson settlers on account of their trust funds at £25,000, became known in Nelson, it created much surprise and dissatisfaction, and a memorial was

drawn up and forwarded to the Court of Directors in November, 1847, clearly shewing that the fund available for the purposes of the settlement, was or ought to be, not £25,000, but £60,000.—Parliamentary Papers on New Zealand, of 1850, p. 186.

jefty's government (in which there is not a single stipulation in favour of the settlers), seeing also, with equal surprise and regret, that the directors, in their reply to Dr. Evan's application on their behalf for compensation, distinctly repudiate their liability to make any such compensation, feel that the time has arrived when it is incumbent upon them to call upon the directors of the New Zealand Company to fulfil the conditions upon which the settlers purchased their land.

"3.—That although one of the terms of purchase was, that the purchasers should have power to select the most fertile and available land in the territories of the Company, yet the quantity of land thrown open for selection has not only been extremely limited, but the most fertile and available districts in this settlement (as for example, the Wairarapa, and the right bank of the Manawatu,) have been kept back for the purpose (now openly avowed,) of forming new settlements, and that the purchasers have, in consequence, been compelled to select land, the greater portion of which is utterly unavailable and worthless.

"4.—That the directors agreed with the purchasers of land to expend £75 out of every £100, for their exclusive benefit, retaining the remaining £25 for their commission; that the Company have been awarded by government for every £75 (so agreed to be expended for the exclusive benefit of the purchasers,) 300 acres of land, of which they have given 100 acres to the purchasers, appropriating the other 200 acres to their own use, so that the Company have actually expended only twenty-five per cent. for the exclusive benefit of the purchasers, and have reserved to themselves seventy-five per cent. as their commission.

"5.—That inasmuch as the directors have sought compensation from government for their losses arising from the delay that has occurred in their obtaining possession of their lands, they have virtually admitted that compensation is due from themselves to those who purchased land from them.

6.—That a memorial be addressed to the directors, calling upon them to fulfil the conditions referred to in the preceding resolutions, viz.,—1st, That all the available districts in the neighbourhood of this settlement (as the Wairarapa, &c.) be purchased, surveyed, and thrown open for selection to the purchasers of land, who shall be at liberty to throw up the unavailable land they have been so unjustly compelled to select; and, 2ndly, that the land, amounting to 256,330 acres, awarded to the Company by the government, in virtue of the money paid to, and agreed to be expended by the Company for the exclusive benefit of the purchasers, forming the first and principal settlement, be placed at their disposal."

A still stronger case against the New Zealand Company was set forth in the subjoined petition of the Nelson settlers, presented by Benjamin Hawes, Esq., to the House of Commons, on the 8th of February, 1847:—

"The humble Petition of the undersigned Owners of Land and Agents of Absentee Proprietors in the settlement of Nelson, New Zealand,

"Sheweth,—That your petitioners purchased land from the New Zealand Company, the great majority

of them so long ago as the year 1841, for which they paid £300 for 201 acres.

"That they did so, relying upon the high character and position of the directors of the New Zealand Company, and upon the faith of certain letters sanctioned by them, in which it was stated that the Company possessed the right of selecting land in any part of the colony, and that a body of capitalists desirous to emigrate to New Zealand had applied to the Company to form a new settlement. These letters are published in the Parliamentary Papers upon New Zealand for the year 1841.

"That it was proved that the New Zealand Company did not possess the right of selection assumed by it, by the fact of Governor Hobson refusing to allow it to form the settlement at Port Cooper, as it desired to do.

"And that your petitioners have since had reason to believe that no body of capitalists desirous to emigrate, such as those alluded to, ever had any existence.

"That your petitioners bought their land in accordance with certain terms for purchase, published at the time by the New Zealand Company, and which will be found in the same volume of Parliamentary Papers. By these terms of purchase, the Company undertook to form a settlement, which should consist of 221,100 acres, the site of which, it is stated, shall be the best that may be available at the time of the selection being made, and that the position, with reference to Port Nicholson and the rest of New Zealand, shall be such, that the land may reasonably be expected to advance in value with the utmost rapidity. The Company, by the same terms for purchase, pledged itself to appropriate the purchase-moneys of the land offered for sale, amounting in all to £300,000, in the following manner, viz.:—

£150,000 to the exclusive purpose of emigration to this particular settlement:

50,000 to defray the Company's expenses in selecting the site and establishing the settlement; any surplus of this fund to be applied to the public purposes next mentioned:

50,000 to public purposes, for rendering the settlement commodious and attractive; as such purposes, it is intended to apply £15,000 to religious uses and endowments, for colonists of all denominations; £15,000 to the establishment of a college in the settlement; and £20,000 towards encouragement of steam navigation, for the benefit of the settlement, by way of bounty:

50,000 to the Company for its expenses and profit on the use of its capital:

£300,000 Total.

"That the site chosen for the settlement has been found to be wholly inadequate to the fulfilment of the Company's liabilities, nor can the just claims of the purchasers be satisfied, unless an equitable adjustment be effected by a remodelling of the original scheme, or by compensation.

"That up to the present times, only 51 acres have been offered for selection out of each allotment of 201 acres, which your petitioners paid for so long ago, and that no title has been obtained to any part of the land.

"That of the land thus distributed, one-half at the lowest calculation, is utterly worthless, and without any prospect of ever acquiring value.

"That in consequence of these circumstances, your petitioners have sustained much loss and injury, and are not placed in that situation for the exercise of their industry which they had a right to expect.

"That the New Zealand Company, although under contract to expend the public funds of this settlement in the stipulated manner above mentioned, although calling itself the trustee for the purchase-money of the land in the settlement (see Parliamentary Papers), and although at the present time it admits, by its seventeenth Report, a liability to Nelson of £57,000, did, in the month of June, 1844, suddenly and without warning cease all expenditure in the settlement, throwing a body of 300 labourers out of employment, causing thereby the greatest insecurity, and much suffering from destitution, nor has it, from that date up to the present time, expended any money in fulfilment of its engagements.

"That the New Zealand Company has lately communicated to the colonists some regulations for the disposal of lands in the settlement of Nelson, until further notice, which appear to your petitioners unjust and injurious, and have produced a very general apprehension that it is not the intention of the Company to fulfil its contracts or make any compensation to its purchasers.

"That no legal redress can be obtained in this colony from the New Zealand Company, or its agents, while it is next to impossible for most of your petitioners to have recourse to the courts of law in England.

"Your petitioners therefore pray that it will please your honourable House to pass an act enabling your petitioners to obtain legal redress in the colony of New Zealand, by suing the principal agent or other officer of the Company, or to take such other measures as to your honourable House may seem most fit and expedient to forward the views of your petitioners.

"And your petitioners will ever pray.

"C. A. DILLON.

"D. MONRO.

"DONALD SINCLAIR.

"HUGH MARTIN.

"&c. &c. &c."

In April, 1846, certain remedial measures for the grievances of the Nelson settlers, into the nature of which it is not necessary to enter, were proposed by the directors in the form of regulations for the disposal of lands in that settlement. The colonists assembled, drew up and forwarded to the Company, by common consent, an indignant protest against the newly issued regulations, on the following sufficient grounds:—

"Because they are an infringement, without our consent, of the contract under which we purchased our lands.

"Because from the words, 'until further notice,' we infer that it is in contemplation by the Company to make still further changes.

"Because a larger proportion of our funds is ap-

propriated by the Company than under the original agreement.

"Because the surveys are to be charged to the settlement.

"Because the principle that every purchaser is entitled to good and available land for his money is not admitted.

"Because the allotments, too small already, ought not to be further subdivided.

"Because the calculations of 'New Proceeds' are founded on utter misapprehension.

"Because the religious and educational funds were subscribed without any such conditions as are now attempted to be annexed to their employment.

"Because these regulations have a tendency to induce purchasers of land, under the pressure of adverse circumstances, to compound and accept less than they are justly entitled to under the original contract."

At the commencement of the next year a rumour reached Nelson that the governor was to be removed from New Zealand, and that the powers of government were to be delegated to the New Zealand Company; upon which the settlers again called a public meeting and passed several resolutions, copies of which were forwarded to the colonial minister by Governor Grey, deprecatory of the anticipated change, as objectionable in theory, and not calculated practically to improve their condition. In the fifth and sixth resolutions, the colonists declare,—

"That, apart from such general considerations, we feel most strongly opposed to any such delegation of the powers of government as is sought for by the New Zealand Company; because *our experience of the administration of the affairs of this settlement by that body has convinced us of its incapacity, and destroyed all confidence on our part, either in the wisdom of its measures, or in the integrity of its conduct.*

"That the twentieth report of the directors of the New Zealand Company lately received the letter of Mr. Edward Gibbon Wakefield appended to it, and the report of the committee upon that letter, are all characterised by a most extraordinary ignorance of the state of the colony, and of their own settlements in particular, by predictions of which the subsequent course of events has shown the absurdity in the most striking manner; and by the suggestion of a course of policy for the future, based upon error, visionary and impracticable."*

One more appeal from Nelson, the most touching of all, still remains to be noticed, namely, the "Memorial of mechanics and labourers claiming compensation from the New Zealand Company." After describing the difficulty which they had had in inducing the agent to give them employment, notwithstanding the distinct pledge given to them in that respect by the Secretary of the Company before leaving England; they say that they were at length compelled to work, or starve, under a system which was

* Parliamentary Papers on New Zealand, December, 1847, pp. 11, 12.

the nearest approach to pauperism that could have been adopted—not at their respective trades, as they had been led to suppose, but at the clearing of forests and the making of ditches and roads:—

"Some of our fellow-emigrants, after a short stay, found means, some by working their passage, others by selling their clothes, tools, and other little effects, to leave the settlement,* and we trust thereby escaped those miseries, amounting almost to starvation, which most of us were subjected to. * * * We commenced the work ordered to be done by leaving our families, and proceeding, with a week's provisions, our bedding and tools on our backs, to a distance, varying from one to thirty miles, through districts of hills, swamps, forests, and rivers, penetrable only by excessive exertion: those of us who were stationed farthest off would reach our destination almost exhausted, where we had to erect temporary huts of fern, or such other material as the locality afforded, to shelter us at night; and how inadequate these hovels were to shelter us from the inclemency of the weather, many have had too sorrowful proofs on being afflicted with rheumatism and other disorders, consequent upon exposure to damp and night air. Our work consisted in clearing timber, digging roads and ditches, being in this part of our work for days up to our knees in water, intensely cold, for which we received the following wages:—Single men, per week, ten shillings; married men, with two children, sixteen shillings; married men, with three or more children, eighteen shillings. * * * At last the period arrived when the whole of us, even those who occupied land, were discharged, and a state of distress arose almost impossible to describe; food of every description became so scarce, that seed potatoes, which had been in the ground a fortnight, were dug up to appease hunger; for months most of us never tasted bread, but were forced to eat wild greens, and in some instances rats were eaten to satisfy and sustain us. Many were thus forced to abandon the land they had commenced cultivating, and go to work for those of the land-purchasers who were able to employ us, we may say at the nominal rent of 12s. per week; for, having to take just such goods as they happened to possess, and at their own prices, we believe we state the outside when we say we had not more than 8s. per week. For a great many months a large number of us had no other food than potatoes, and cheap as salt was, few could raise even that necessary to eat with them: the consequence of living on this and worse food for so long a time, produced in our families most distressing cases of diarrhoea, and such a general prostration of physical strength as to incapacitate us from doing the labour within a day that we had been accustomed to do, and from the effects of which we doubt not our health has been greatly impaired, and if we were in England, could scarcely obtain that medical certificate which was essential to our obtaining a passage out here.

* "When I took charge of the Company's affairs in 1843, there were only fifty labourers regularly employed by the agriculturists. Also out of about 3,000 sent out by you, 937 re-emigrated."—*Vide Report of the Settlement of Nelson*, by W. Fox, Esq., 1849, p. 14. The above avowal reads strangely from the pen of the agent of a Company, who professed to have succeeded in solving the difficult problem of rightly adjusting the proportions of capital and labour.

DIV. VI.

"We feel we should not fulfil the whole of our duty if we omit to bring before you the case of the widows and orphans of those of our fellow-labourers who were induced, and in some instances forced, under the penalty of losing their employment, to accompany your agent to the Wairau; and suggest on their behalf, that whatever may be the result of our own claim, that full justice may be done to them, and that their loss may in some measure be mitigated by the presentation of such a portion of land to the children, as, when they attain to sufficient age, may enable them to provide for themselves, and assist their widowed mothers."†

The sorrowful tales of individual suffering endured by the settlers of Wellington, Nelson, New Plymouth,‡ Wanganui, and Manawatu, can have no place in a work of this nature. Sufficient evidence has already been adduced from public documents, to show the general sense of wrong and injury entertained by them against the Company, whom they unite in accusing of wilful disregard of their interests. Their statements are corroborated by the testimony of Governor Grey, upon whom the ungracious task of settling their land-claims had devolved. The amount of compensation to which he considered the natives entitled, was deemed excessive by the Company, especially in the case of the Porirua and Wairau districts, to which the Land Commissioner had decided the claim of that body to be wholly unfounded. With regard to the Wairau, Mr. Spain had reported, that though aware that the question necessarily involved a reference to the melancholy occurrence connected with it, he had, nevertheless, come to the decision expressed above, after much and careful deliberation, after a consideration of the evidence which had been given on the whole case, and which he could not but declare, had failed to prove in any way that the district in question had ever been alienated by the parties from whom the Company asserted, through its agent, that it had been purchased.§

The sum of £2,000, by instalments, was agreed to be paid to the native owners for the Porirua, and £3,000 for the Wairau district, by the governor, who thus states the circumstances under which the arrangements were made, sets forth the view

‡ The New Plymouth colonists forwarded a memorial to the Court of Directors, to much the same effect as those already quoted from Wellington and Nelson, which I have seen, but at the present time am unable to obtain a copy.

§ Parliamentary Papers relating to New Zealand, April, 1846, p. 41.

of the land-question acted upon by the Company, and exposes the culpable indifference manifested by them, and not by her Majesty's government, to the great distress occasioned by the non-settlement of their land claims:—

"After I had been for more than fifteen months in the colony, I found that the agent of the New Zealand Company was making no effort to acquire the tracts of land required by the Company to fulfil their engagements; and, as great distress from the non-settlement of their land-claims existed amongst the settlers, and as it was impossible for the country to settle down into a thoroughly tranquil state until these questions were definitely arranged, and her Majesty's government has so repeatedly urged upon myself and my predecessor the necessity of a prompt adjustment of them, I felt it to be my duty, although I would most gladly have avoided engaging in so difficult and ungracious a task, to make the most advantageous settlement of these questions which I could effect.

"I should also observe that the position I understand to be adopted by the New Zealand Company's agent, that if tracts of land are not in actual occupation and cultivation by natives, that we have, therefore, a right to take possession of them, appears to me to require one important limitation. The natives do not support themselves solely by cultivation, but from fern-root—from fishing—from eel ponds—from taking ducks—from hunting wild pige, for which they require extensive runs—and by such like pursuits. To deprive them of their wild lands, and to limit them to lands for the purpose of cultivation, is in fact, to cut off from them some of their most important means of subsistence, and they cannot be readily and abruptly forced into becoming a solely agricultural people. Such an attempt would be unjust, and it must, for the present, fail, because the natives would not submit to it: indeed they could not do so, for they are not yet, to a sufficient extent, provided even with the most simple agricultural implements; nor have they been instructed in the use of these. To attempt to force suddenly such a system upon them must plunge the country again into distress and war; and there seems to be no sufficient reason why such an attempt should be made, as the natives are now generally very willing to sell to the government their waste lands at a price, which, whilst it bears no proportion to the amount for which the government can resell the land, affords the natives (if paid under a judicious system) the means of rendering their position permanently far more comfortable than it was previously, when they had the use of their waste lands, and thus renders them a useful and contented class of citizens, and one which will yearly become more attached to the government.

"I am satisfied, that to have taken the waste lands I have now purchased by any other means than those adopted, would once more have plunged the country into an expensive war, which, from its supposed injustice, would have roused the sympathies of a large portion of the native population against the British government, and would thus probably have retarded for many years the settlement and civilization of the country."

To the various extracts quoted in the last few pages, one more may be added

from a very brief but admirably condensed pamphlet, which well deserves the careful perusal of all interested in the powerful association, whose proceedings have, from their commencement, formed an important portion of the history of the colony whose name they bear:—

"The system of sale, selection, survey, and distribution of land, in sections of an allotment, was alone fatal to success—and kept the unfortunate colonist without land, until the little capital which remained to him after the purchase of the land, was absorbed in the expenses of his maintenance, whilst waiting for the discovery, survey, and delivery of the land.

"The writer would maintain that those who have purchased land from the New Zealand Company, and others who have been induced to proceed to New Zealand, or otherwise have been deceived and injured by it in its service as surveyors and contractors, are the parties really entitled to reparation and compensation.

"And that the government should not aid—but restrain the New Zealand Company, because it is great wickedness and cruelty (and by the New Zealand Company confessedly incompatible with the dignity of the government,) to induce persons of small capital to buy land which they have not seen—or to induce such, if unaccustomed to manual labour, to emigrate to New Zealand, where they cannot compete with the emigrant labourers who have become cottiers, or with the natives in the cultivation of land."*

The foregoing arguments have all been unfavourable to the Company; on the other hand it was urged, that whatever their errors and short-comings might have been, they had promoted the cause of colonization by bringing it in various ways before the public; that they had founded settlements, that large sums of money, whether lavishly or providently, had been expended through their instrumentality, in emigration, in the conduct of which one great merit was incontestible, viz., that of having carefully avoided that disproportion of sexes which forms a fruitful source of immorality in most new colonies. These arguments, and many less reasonable ones, urged both in and out of parliament by eloquent and deeply interested advocates, among whom the late Charles Buller was ever foremost, and backed by a strong political party, were used with so much success, that not only were greatly extended privileges to those granted to the Company in 1840, conceded to them in 1847; but, in addition to the loan of £100,000 sanctioned by the House of Com-

* *A few Plain Facts concerning the Settlement of Nelson*, pp. 11, 12. Printed by T. C. Newby, 72, Mortimer-street, Cavendish-square, 1848.

mons in the previous session, another large portion (£136,000) of the taxes levied in the United Kingdom was advanced to enable them to resume those very operations which had been attended throughout by signal and disastrous failure. The joint-stock company itself, formed, as we have seen, "with an exclusively commercial object," although it had received "by anticipation," an extravagant price for lands which it did not possess, and, therefore, could have no power to sell, had become avowedly bankrupt, and the "self-supporting colonies" which it had founded had entailed very heavy charges on the mother country. Earl Grey, however, looking rather to the good so influential an association might accomplish, if their means and energies were rightly directed, and considering of what great importance to imperial interests it was that the colonization of New Zealand should go on steadily and rapidly, and that the ancient disposition to plant settlements of Englishmen in her Majesty's distant possessions, should be revived and established, was "inclined, before resorting to any less satisfactory course, to see whether it may not be possible to put the Company itself in a position, by renewing its operations, to repair its losses, and, at the same time, to restore the prosperity of the existing settlements, and make New Zealand the seat of an extensive and thriving colony. * * * Lord Grey is therefore willing to make the government a party to the fair trial of the experiment, whether the Company can be placed in a position that will enable it, after a certain period, to continue its operations without further assistance and with reasonable prospects of success. He is willing, for this purpose, to give the Company the amplest means that can be afforded by the exclusive use of the crown lands in the southern government of New Zealand. He is willing to stipulate for the advance, during a limited period, of considerable sums, for the purpose of enabling the Company to *meet its present liabilities*, and the outlay necessary for the vigorous prosecution of its operations."* The subjoined terms which his lordship, on the part of the government, proposed to the New Zealand Com-

pany, were so extremely advantageous to that body, that they were, of course, immediately accepted:—†

"Memorandum of Agreement with the New Zealand Company.

"I. (1.) It is proposed that a commissioner be appointed by her Majesty to be a commissioner for the New Zealand Company.

"(2.) That the name of the person selected by her Majesty be submitted to the directors of the New Zealand Company, and the appointment take place on their signifying their approval.

"(3.) That this commissioner attend all meetings of the directors, and have access to all books, papers, and accounts of the Company, and that the Company shall agree that no resolution shall ever be adopted at any meeting of the directors without the assent of the commissioner.

"(4.) That the commissioner be paid a salary of £1,500 a-year out of the funds of the company.

"II. That during the period for which the present arrangement shall last, the government shall give up to the Company the entire and exclusive disposal of all Crown lands, and the exercise of the Crown's right of pre-emption of lands belonging to the natives in the southern government of New Zealand, and undertake during such period to execute any grants, leases, or mortgages, for which the court of directors and commissioners shall engage.

"III. That during three years commencing the 6th of April ultimo, the government shall engage to place at the disposal of the Company, during the first year such sum of not more than £28,000 over and above any sum now payable to the Company under any former loan, during the second year such sum not exceeding £72,000, and during the third year such sum not exceeding £36,000, as shall be required by the Company and the commissioner from time to time, for the purpose of discharging the existing liabilities of the Company to an extent not exceeding £79,000, and of conducting its colonizing operations.

"That all sums accruing to the Company in each year, beyond those which it is bound to expend for the benefit of the purchasers of its lands, shall be expended in furtherance of the general objects of the Company, with the view of diminishing the amount of advances which may be required from her Majesty's government.

"That during that period no interest shall accrue from any debt to the government, nor for any claim to compensation on the part of the Company.

"That during the first year no dividend shall be paid to the proprietors of the Company's stock, nor any in either of the two following years, without the express sanction of her Majesty's government.

"That the Company shall at once give up all claim to lands in the neighbourhood of Auckland, and take the whole amount awarded to it elsewhere.

"IV. That if the Company shall be in a condition at the end of the three years to continue its operations, the present arrangement with respect to heads I. and II. shall continue, and shall be made permanent either by a new charter or by act of Parliament, upon the Company agreeing to such restriction on its disposal of land, dividends, and application of funds, as shall then be agreed upon between the Company and her Majesty's government.

"That the Company shall in that case abandon all claim to compensation from the government.

* Parliamentary Papers, June, 1847, pp. 111-12.

† This "agreement" was carried out by virtue of an act of Parliament, intitled "an act to promote colonization in New Zealand, and to authorize a loan to the New Zealand Company."

"That all advances already made, or within the period of three years to be made, to the Company by the government, shall be in that case constituted as the Company's debt, the principal of which the Company shall be bound to repay by an annual payment of not less than one-fourth of its clear profits after payment of all expenses.

"V. That if at the end of the three years the Company shall be unable to continue its operations, her Majesty's government shall take the Company's assets, together with the liabilities contracted by it to third parties during that period with the assent of the commissioner, and any debt which may still be due from it to the Nelson settlers.

"That all debts due from the Company to the government shall be remitted, in consideration of the Company's admitted claims on the government.

"That the lands now belonging to the Company, consisting of 1,048,991½ acres awarded to it and as yet unsold, together with 24,491½ acres held by it in virtue of purchase within its settlements, shall be taken by the government at the rate of 5s. an acre.

"That the Company shall be entitled to payment of the sum so due to it, together with interest at the rate of three and a half per cent. thereon, out of the proceeds of all returns over and above the outlay for surveys and emigration, accruing from the sale of Crown lands in New Zealand, but not from any other source.

"That the New Zealand Company shall thereupon be forthwith dissolved, except for the purpose of receiving such annual payment.

"VI. That neither the Crown nor the New Zealand Company shall, in any part of New Zealand, sell any lands not previously sold by them for any sum less than 20s. an acre, nor expend less than 10s. an acre of the proceeds of such sale in carrying out emigrants."

Once again the New Zealand Company was placed in a position to make amends for the past, and to adopt for the future, a wiser theory—a more honest practice. Its first step after receiving from government such abundant means for the express purpose of "enabling it to meet its present liabilities," ought unquestionably to have been the fair and full investigation of the various collective and individual claims brought against it, with a view to their immediate liquidation. And its doing so, ought not in justice to the interests of the public to have been merely implied in the agreement as a matter of course, but on the contrary should have formed a leading proviso, the non-fulfilment of which should have rendered every other void. Had this precaution been taken, the injuries sustained by the great body of enterprising colonists, which Earl Grey justly deplores, and especially those of Nelson, would not in the spring of 1851, be still unredressed;

* The directors did not shew the same indifference to their own personal claims, for we find them immediately appropriating £8,277 : 7s. : 2d. "for attendances of directors at courts and committees, from

nor would they have had so much reason to describe themselves as having, between two stools, fallen to the ground.*

The next important transaction in which the Company engaged, was the establishment of the long projected Scotch Settlement of New Edinburgh, the site for which had been fixed, and the requisite quantity of land purchased in 1844, under the following circumstances:—The directors who, in the first instance, especially desired that Port Cooper should be the locality chosen, through their principal agent, Colonel Wakefield, offered Mr. Tuckett the appointments of chief surveyor and acting agent of "New Edinburgh" on that understanding. Mr. Tuckett's melancholy experience at Nelson, of the ruin, blighted hopes, and poverty, consequent on the ineligibility of that district for the requirements of the colonists, induced him to decline being connected with the formation of another settlement, unless he should first be enabled to ascertain the district itself to be calculated to answer the reasonable expectations of the land purchasers and the emigrants. Colonel Wakefield accordingly consented to intrust to him the unfettered selection of the best district in the Middle Island, for the projected settlement, and Governor Fitz-Roy cordially entered into the plan by appointing a gentleman, Mr. J. J. Symonds, to assist (on the part of the government,) in effecting the purchase so soon as the site should be determined.

Mr. Tuckett chartered a small vessel, and proceeded to explore the Middle Island; after careful examination, he fixed upon the country between Otago (or more properly Otakau) and Tokata Point, considering it not merely very superior to the great plain adjacent to Port Cooper, but also far surpassing in natural advantages the most sanguine expectations his previous experience in New Zealand would have permitted him to form. Being possessed of the entire confidence and good-will of the native owners, he found no difficulty in negotiating for the land. He submitted to them a sketch in which the desired district and their intended reserves, were clearly defined, and received in return an offer for the sale of nearly 500,000 acres (more than double the required quantity), for £2,400, signed by the 1st of March, 1842, to the 31st of March, 1848." In the following year, £1,180 : 4s. : 8d. was applied for their benefit. *Vide* 24th and 25th Reports of the Directors of the New Zealand Company.

the chief men on the part of all concerned, without a single dissentient voice.

In transmitting to Colonel Wakefield the offer of so valuable a district at so inconsiderable a price (less than three half-pence per acre for some of the best land in New Zealand), Mr. Tuckett expressed his conviction, that it would be good policy on the part of the New Zealand Company in the scheme of their future settlement, to appropriate as much as sixpence per acre to the remuneration of the natives, to be paid in four annual instalments; he at the same time explained that he could not have obtained an offer of the land at such a price but through the influence of an energetic colonist (Mr. John Jones) with the chiefs.

So different, however, was the opinion of the principal agent on the subject, that we find him in reporting the business to the Court of Directors, adopting a deprecatory tone, and saying that "the purchase-money of the block at Otago, may appear large; but it must be borne in mind that the block contains about 400,000 acres, with 150,000 only of which the Company will be charged, the remaining portion being available for the depasturing the flocks and herds of the settlers. It is probable that the natives would have consented to receive something less; but the sum having been fixed upon by Mr. Tuckett before my arrival at Otago, I thought it better not to disturb his arrangement."* Adverting to Mr. Tuckett's rejection of Port Cooper, Colonel Wakefield says, "the decision he has come to, to fix the New Edinburgh Settlement at or near Otago, is satisfactorily accounted for by his description of the relative merits of the places he has explored. I need not make any remarks on the zealous manner in which Mr. Tuckett has performed his task, further than to express my entire satisfaction at having had the advantage of his judgment and unwearied exertions in determining so important a point as the locality of the proposed settlement."† The directors thought fit to withhold from publication the "description of the relative merits of the places explored," forwarded to them by Colonel Wakefield, and so favourably commented upon, on the plea of its length; the more obvious reason being that they continued bent upon forming a settlement at Port Cooper, and did not choose to publish any but favourable

reports of that locality. The native interests at Otago were well cared for by Mr. Tuckett in respect to large and valuable reserves. One of these commencing at the southern headland of the harbour of Otago extends along the south-east shore of the harbour for about four miles, and along the sea-shore outside for six miles. Almost immediately after the completion of the purchase, this large reserve was occupied as a dairy-station by squatters, from Wellington, who made an arrangement for this object with one chief, Karitai, from which it is not likely that the natives in general will derive any benefit, whilst the pasture, and consequently the opportunity of keeping stock themselves will be lost to them. The first settlers sailed for Otago in November, 1847; in the same year another "class" settlement was projected which at the present moment occupies a considerable share of public attention, viz., that of New Canterbury.

The directors of the New Zealand Company in their first official notice of the intended settlement, and of the association by which it had been set on foot, entirely identify themselves with the interests and views of both the one and the other, stating in the twenty-fourth report to the court of proprietors (p. 6), "Its site will be fixed in the territory confided to your administration; its strength be sustained by the aid of your (? the public) funds till such time as the lands purchased from you shall be laid out and resales effected to some considerable extent; and while in all probability it will obtain, by means of a royal charter, the power of separate and independent action, it will remain a perpetual and most gratifying record of the principles of colonisation at which you have always aimed, and of the usefulness of which, had not adverse influences thwarted, you might long ago have become the frequent instrument."

This pompous declaration appears to be so far true, that in the system adopted by the Canterbury Association, there may unhappily be traced several of the primary errors which have peculiarly marked the proceedings of the New Zealand Company, especially that of fixing a ruinously high price on land. At a public meeting of the Association (after its incorporation by royal charter, in November, 1849, with a view to the formation of a settlement, "in which, from the very first, all the elements of a sound and right state of society shall be in

* Seventeenth Report of the Directors of the New Zealand Company, pp. 142, 143.

† *Idem*, p. 131.

active operation,"*) Lord Lyttelton, as chairman, stated that—

"With regard to the details of the plan, the first that he thought it necessary to notice was a matter of considerable importance,—the price of land. The association had placed upon the whole of the extensive district held in trust for them, comprising considerably more than 2,000,000 acres, the price of £3 an acre. On this point some explanation was necessary, for that value was considerably more than had been placed on the land in any of our colonies at the period of their original occupation; and many of those present might be aware that the price of £1 an acre, demanded by the government throughout the Australian colonies, was very generally complained of as being too high. The whole of the land of the southern province of New Zealand, including the whole of the Middle and a portion of the Northern island, was for selling purposes in the hands of the New Zealand Company. Now, of the £3 an acre charged by the Canterbury Association, one-sixth, or 10s., was to go to the New Zealand Company as the actual price of the land; another sixth was to be applied to the general expenses of the association in this country and in the colony; one third, or £1, was to be applied to promote emigration, in order to meet the demand for labour; and the remaining £1 was to be devoted to the leading and cardinal feature of the undertaking—the provision, from the very beginning of the colony, of religious and educational establishments. To the provision, on this scale, of such establishments, he wished particularly to call the attention of the meeting. This was a chartered association, and was bound to constitute a colony according to the principles of the Church of England."

Mr. Samuel Sidney, in an able and honest speech, exposed several of the evils attendant upon fixing so high a price, particularly that of its excluding the most valuable and enterprising class of emigrants, but without effect; at least so far as the leading members of the Association were concerned. The utter fallacy of the notion of a body of colonists going out to form at once a "daguerreotype miniature of England, complete in every respect, in religious principle, in education, and in all social influences; and only incomplete in the reproduction of those vices, which, most unfortunately, crept into an old country, and that pressure from without, which fell so heavily upon all classes of society here,"† could scarcely fail to be understood by all conversant to any extent with the practical details of the first establishment of colonies. At all events, the Canterbury Association have no excuse for shielding themselves under the plea of ignorance, having received the following very

explicit warning on this and some other points, from one of their warmest well-wishers, Dr. Selwyn, Bishop of New Zealand—

"You are a body which ought and will be able to dispense with all trickery and gambling.

"In the first place, it is a pure delusion to talk of founding a colony at once. . . . A more wasteful system could not be devised than that of congregating large bodies of settlers at once upon the same spot, requiring at once exactly the same supplies, and tempted by their discomforts and their necessities to acquiesce in the most extortionate prices for everything that they buy. If a settler has to pay £100 for a house worth only £50, it is a clear loss to the community, especially as the money generally goes to some other settlement, from which the supplies must, in the first instance, be derived. The loss which is sustained by a new community from the excessive price of all the necessaries of life is incalculable. My advice, therefore, is, form as large a plan as you please, but carry it out gradually and cautiously. Let each section settle itself before the next arrives, that it may be a help instead of a hindrance to the new comers. An interval of at least a year would secure this, and would enable each detachment to arrive at such a time as to have the summer before it, which is a point of great importance in a wet climate.

"On the organization of these sections I would suggest that the arrangement should not be merely numerical, but local and topographical. Let a good leader, like a queen bee, undertake to form the township of Oxford, or Stratford, or Mandeville, or what you will, and secure a right good clergyman and schoolmaster as the first step. Then, as in the old Roman armies, *legit virum vir*: let all the Oxford men send in their names to their own leader, with recommendations of good, hardworking, honest, and sober labourers for the free emigrants. When the Oxford leader is able to announce that land is bought at Oxford to a sufficient amount to yield an endowment for a clergyman, and to build a church and school, then let due notice be given to the agent in New Zealand, that on the 1st day of November, 185— or thereabouts, he may expect the Oxonians. If possible, a bishop will be there to meet and receive them, and accompany them at once to their own place, where a pretty wooden spire will be already built, and visible far over the plain, to guide them to the house of God, where they may offer up their thanksgivings for their successful voyage. There they ought to find a store of building timber and firewood already laid in, at fixed, but not extortionate prices, and will be able to settle themselves in peace, and be ready to give a helping hand on reasonable terms to the flight of Stratfordites, who will arrive about the same time on the following year."

The bishop then proceeds to discuss the best means of securing the objects aimed at by the Association, namely, to supply the colony with a sufficiency of labour at the

Canterbury Association.—*Vide Times*, 19th April, 1850.

† *Vide Times*, of December, 1850, for notice of Captain Simeon's speech, at a meeting of the Canterbury Association.

* Speech of Lord Courtenay, M.P., at the above-named meeting, which was held at St. Martin's Hall, Long-acre, on the 18th of April, 1850, "for the purpose of giving information concerning the objects, plans, progress, and prospects" of the

least cost to the emigration fund, taking care that the supply should always bear a due proportion to the demand.

"To secure these objects, many ingenious calculations have been made, with about as much effect as the numeration which we used to practise on our brass buttons at school, allotting to each its due title of soldier, sailor, tinker, tailor, gentleman, apothecary, ploughboy, or thief. That all these elements do enter into the composition of all societies cannot be doubted, but no chemistry of the emigration commissioners will ever discover beforehand, in what proportions they must be mixed to form a healthy community. But all these things will find their own simple and natural adjustment, if neither the tinker nor the apothecary be employed. Colonies will work well if they are let alone. When your Oxford section has taken up its ground, they will soon find out their own wants. A blacksmith will be found to have been left out, and every one will be crying out for some one to mend his plough. 'Why, I have a cousin that's just the man we want,' some one will say; 'Could we not get him out to help us?' 'I will give £1 to his passage, and he can pay me in work.' 'I will give another.' 'May be the association will go halves in the expenses.' 'Write and ask.' The next year, out comes the Oxford blacksmith at half-price. 'Which is the way to Oxford?' 'Where you see that spire out yonder. But won't you stay in the emigration-harrack till you hear whether you can get work?' 'What do I want of an emigration-harrack? Is it not bad enough to have been shut up in a ship? I know Mr. Goodfellow; he is my cousin; he will put me up till I can get a place for myself.' The above is a true description of what is going on every day in a thriving colony. One man has more food than he knows what to do with, and he wishes for some poor relation to come and help him to eat it; another remembers some country lass, whom he did not dare to ask to marry him when he had nothing to offer her; a tradesman has business on his hand, and wants a youth to keep his books; a mechanic has more work than he can do, and would be glad of a mate. All these know exactly the sort of person that is wanted, and will not send for him unless he can be well employed. Demand and supply represent one another by the simplest and most natural adjustment, and at the cheapest rate of expense.

"The next great point is, that I advise you most strongly to give up, for the present, at least, all the usual trickery of town acres; I mean at the central or post-towns, for the country towns will not much excite the mania of speculation. In Port Cooper this seems to be more especially necessary, because a few lucky purchasers, engrossing the whole of the small quantity of available land near the anchorage, will have it in their power to put the public to the greatest inconvenience. The defects also of the site of Christchurch are so great, that I would not advise you to put it in the power of any body of purchasers to demand a great outlay of public money to give them a better access to their townland. The plain is the great point at Port Cooper. A good road over the hills, and a few public stores on the beach, where goods can be warehoused by the association at paid charges, and a small quantity of land let to retail shopkeepers, will enable the settlers to be in their operation. The

excess of mercantile speculation is a cause of great loss to a new community. It seems to be so much easier to buy and sell than to dig and plough, that half the population become shopkeepers as if by magic, the gentry dignifying their employment by the name of storekeeping. You would suppose that 'slops,' rice, and sugar, were the spontaneous produce of the soil, and that men believed that they could grow rich by merely exchanging one with another the fruits of the labours of others, without working for themselves. Of course, what is easy to all will be done by too many, and therefore will be profitable to very few. And thus the country, with its mine of wealth, is robbed of the industry which would have made it profitable, and the town, like a great lazy tumour, drains and wastes the resources of the body, without contributing anything in return. My advice is, plant the country, and let the town grow of itself. Let the course and progress of the colony show when, where, and by whom, stores, manufactories, &c., ought to be established. When the need is shown by a demand, town land can be sold or let with a privilege of purchase, and then the actual merchant will become the proprietor, instead of having to buy or rent his land on exorbitant terms from some absentee owner, who has pre-occupied the best positions for business.

"To pass on to the higher and more important branches of your plan: the provision for education and religion. The example of the China bishopric is a warning how long good plans may be delayed if you wait till the endowment fund be complete. The American system seems to be the best. Have a bishop at all events. It is not at all certain that you will get a better man for £1,000 than for £100 a-year. Such matters are no question of money. Let him get his money as he can for a time—whether as warden of the college or as a parish priest; till the growth of endowments and the increase of duties lead naturally to a subdivision of labour. A colonial bishop in a new colony cannot at first be fully occupied with the duties of his office. If he confines himself to them, he may grow an idle man without knowing why. But in the practical working, as well as superintending institutions not strictly within his own duties, he will find the means of keeping up that habitual energy which his own office will require before many years are past. If you can find a bishop of all-work, he ought to be the first clergyman to land in New Zealand."

There is another portion of Dr. Selwyn's letter, which intending Canterbury settlers would do well to peruse carefully, viz., that in which the Bishop, picturing a meeting of such persons engaged in canvassing their future resources, supposes them to argue thus:—

"£3 an acre is a large sum to give for land, and one acre will only feed four sheep;* their wool will weigh about twelve pounds; and we shall be lucky to get from 7d. to 9d. per pound from the merchants at Port Cooper, so that the clear profits cannot well

* Mr. Tuckett states most decidedly that "the Great Plain adjacent to Port Cooper will not feed one sheep to the acre, but that the upland grasses of Banks' Peninsula, will probably feed two or even three to the acre."

be more than 6d. per pound, or 6s. for the acre, that is, just ten per cent. on our purchase-money. Well, so long as we can live and bring up our families, we have no wish to make fortunes. In fact, the school, the church, and clergyman, are the true interest for the outlay, and not the produce of the land, or the increase of flocks and herds; for this profit has found its limits in the Australian colonies by an excess of all the necessities of life, and by reducing nine-tenths of the settlers to be their own tallow-chandlers."

Now, if the intending emigrants have really, one and all, arrived at this conclusion, after a careful examination of the various circumstances likely to exercise a practical bearing upon their future position,—there is nothing further to be said on the matter, save to express the earnest desire for their prosperity, in which every member of the Church of England cannot but participate; and not churchmen, only, but likewise all who desire to see religion recognised as a vital principle, equally essential to the well-being of an infant settlement or an extensive empire. In their careful and systematic provision for the due observance of religious ordinances, the Canterbury Association have indeed set a bright example to all colonising bodies; nor is it in this respect alone that their proceedings contrast strikingly with those of the New Zealand Company,† inasmuch as they can at once give their purchasers an equitable and legal title, as well as immediate possession of the land which they offer for sale; whereas the Company (except in the case of Otago,) could do neither the one nor the other.

But the question still remains, whether among the large body of colonists who it is reported intend leaving their native land in June, 1851, there are not many individuals who have been led to form very exaggerated notions of the natural advantages of the country whither they are going, and especially of that portion of it

* The Bishop of Norwich, in a speech addressed to the first expedition of the Canterbury settlers, at a public breakfast given to them by the Association shortly before their departure from England, remarked that "it was about twelve years ago that he was present at a great colonists' breakfast like that, and the present occasion reminded him of the circumstances. The first body of colonists to New Zealand (Wellington) were then taking their departure, but they carried out with them no minister of religion, and there were none already before them, nor did they know whether any would follow."
—*Times*, July 31st, 1850.

† *Vide* a little work entitled *Remarks on the Past and Present State of New Zealand*, by Walter Brodie, p. 118. A letter from the author, who returned to England about a year ago, was published

in which they are most materially interested. Has the fact been fully and fairly set before them, that the territory sold by the New Zealand Company to the Canterbury Association, at 10s. per acre, for the express purpose of forming a very extensive settlement, had been previously rejected by the surveyor of the former body, after careful and approved examination, as absolutely unfit, and affording an insufficient quantity of good land for the considerably smaller requirements of the scheme of New Edinburgh?

Have the intending emigrants really, each one for himself, counted the cost, and carefully weighed the grounds upon which they are asked to give £3 per acre for land in one part of New Zealand, when they might select for themselves, as good, if not better, in other localities, for half or even a third of that price? It is well known, that in all new colonies an emigrant with ready money at his disposal, can scarcely fail to meet with more advantageous opportunities for its investment in land suited to his wants, than he could reasonably hope for at the hands of any body of men in England, however energetic and well-intentioned. The temptation of a cheap passage out has induced many a man to take a land-order, which has subsequently proved a heavy clog upon his freedom of action, and compelled him either to remain in a disadvantageous position, to dispose of it at a heavy sacrifice (should he have had the opportunity, which is very doubtful), or to treat the parchment for which he has paid so highly like a piece of waste paper.‡

It is difficult to understand upon what resource the projectors of the Canterbury settlement rely for its exports, or their land-purchasers for the recovery of the capital sunk in purchasing, which should in *The Times* of May 16th, 1851, in which he declares that he cannot imagine how men with wives and families can be so foolish as to pay £3 per acre to the Canterbury Association, when they might go into the northern part, and buy it of government at £1 per acre, with as good a title as they expect by paying £3 per acre for. By paying £300 for 100 acres, £35 goes towards the passage out, leaving £165 for the support of the church, school, and roads, a very large item, and one which no colonist can afford. Mr. Brodie adds, that a colonist, by taking his money out with him, will not only benefit the colony generally, but himself, as ready money there will command many good farms at £1 per acre, and much good land at 10s., from settlers wishing to sell.

have been spent in improving their land. The emigrant labourers cannot be sent out as serfs, and it is not likely that any other inducement than the temporary one of high wages will lead them, as a body, to remain in a settlement where they cannot hope to become cultivators of their own land. And how long will the resident proprietors be able to afford this scale of remuneration? and (strangely as it may sound in English ears,) how long will they be able to compete as producers with the Maori chiefs, who are daily acquiring proficiency both in agriculture and mechanics, and who can command a very considerable supply of native labour? There is reason to believe that they cannot do so even now, for it is stated on very good authority, that "the natives can always undersell the European competitor, and they therefore supply most of the wheat, maize, potatoes, pigs, poultry, and such other articles required by the colonists as are the produce of the colony."* Where, then, will they find a market, when the military force, whose presence now creates so large a demand for home consumption, shall be materially reduced?

The preliminary expedition of surveyors, accompanied by the Resident Chief Agent of the settlement, J. R. Godley, Esq., reached Port Cooper in April, 1850; the first body of colonists (1,200 in number,) sailed from Plymouth in the autumn of 1850, and, it is stated, will be followed by the "main body" in June, 1851; notwithstanding the warnings of the Bishop and other authorities on the inexpediency of this mode of proceeding. Up to November, 1850, the quantity sold amounted to 14,000 acres; and the extent of pasturage let, with a pre-emptive right of purchase, was 70,000 acres.†

A few leading features in the history of New Zealand remain to be noticed. In April, 1847, an unfortunate circumstance occurred, which produced a temporary renewal of hostilities on the part of the natives. Mr. Crozier, a midshipman of H.M.S. *Calliope*, was paying a chief for some work done in thatching his hut, when a pistol he had in his hand exploded,

* *Vide* Letter, dated Government-house, Wellington, 18th of April, 1848, and evidently written by Lieutenant-governor Eyre, published in *Colonial Intelligencer*, of September, 1848, p. 86.

† *Vide* a tract, entitled *Brief Information about the Canterbury Settlement*, published by the Association, p. 5.

seriously wounding the native in the head. A number of the Maories, who had witnessed the act, became greatly excited, believing it to have been intentional. In the afternoon, a deputation came to the principal stockade, to request that the young officer might be given up to them, promising that no harm should come to him, unless their friend died. This being refused, six of his relatives, in a furious access of revengeful feeling, attacked the house of an out-settler, Mr. Gilfillan, who, having received a severe wound from a tomahawk, and seeing the impossibility of making any effectual resistance, made his escape through a side window, in compliance with the urgent solicitations of his wife, who represented to him that his life alone was aimed at, that she had no fear for herself or her family, "because the Maories never injured women or children."‡ On reaching the military station (six miles distant), Mr. Gilfillan declared that the natives were out in all directions, and this, together with its being a very dark night, and the road to the farm an ill defined track, only known to a few of the settlers, and not easily found even by daylight, prevented any one going until daybreak on the following morning, when a party, while proceeding thither, met on their way two little children, wet through with the heavy dew, and shivering with cold, who told them that their mother and the rest of the family had been murdered, and the house plundered and burned to the ground. Soon after their father's escape, their mother had contrived to get them out of the house unseen, and they had remained hidden in a neighbouring ravine all night. The lifeless bodies of the unhappy lady and three of her children, confirmed, to a melancholy extent, the truth of this horrible tale, but a young girl of about seventeen was found in a neighbouring cow-shed, still living, though with a deep tomahawk wound in her forehead, and holding in her arms an infant, who was uninjured. Another babe lay outside the shed, sleeping and unhurt.§ The following night the officers at the military stockade were aroused by a messenger, bearing information that five out of the six murderers had been taken by six

‡ Mr. Gilfillan's evidence at the Court Martial, held at Wanganui, on the 23rd of April, 1847.—Parliamentary Papers on New Zealand, of December, 1847, p. 74.

§ *Vide Sketches in New Zealand*, by Tyrone Power, D.A.C.G., p. 86 to 93, for a simple but pathetic narrative of the whole affair.

natives of the Putiki village, who had hazarded their own lives, to prove that they had had no participation in so barbarous a crime, and felt no sympathy with the perpetrators. The men were tried by court martial, four of them were immediately executed, and the fifth, (a mere lad,) was sentenced to transportation for life.* The fear of an attempted rescue, and the difficulty of sending the prisoners from Wanganui to Wellington, a distance of 120 miles, doubtless induced this proceeding; but the more legitimate, and therefore, satisfactory course, would certainly have been to have delivered up the culprits, to be dealt with by the civil authorities. Power, in his graphic account of the whole proceeding, says "the relations and friends of the men who were hanged, are all in the taua (war party), and are infuriated against us," and, without questioning the justice of the sentence, he describes it as having excited, more or less ill-will throughout the country.

Skirmishes with the troops, of whom about 300 were then at Wanganui, commenced, the outsettlers were compelled to abandon their farms; no one ventured to stir out of the town unarmed, and every man was to be seen driving his sheep and cattle with a gun on his shoulder, and pistols in his belt. In commenting upon this wretched state of things, Power remarks, that it had been supposed by some, that the presence of the troops would be a protection, but wiser men predicted that their coming would be the harbinger of war. "The troops certainly protect the pork butchers of the town, and the drunken riff-raff of which its inhabitants are principally composed; but the real settlers, who have cattle and land to attend to, cannot work under the guns of a stockade, and are therefore particularly exposed to any sudden attack, and cut off before assistance can reach them. To make them secure, nothing less would do than a sentry over every cow, and a serjeant's guard in attendance on each labourer; and even this is scarcely as much as some of them expect."†—*Sketches in New Zealand*, p. 97.

On the 18th of May, the Maories made a regular attack upon the town, advancing on all sides, and getting possession of the bullet

proof houses in the outskirts of the town, from which they kept up a steady fire, while parties of them carried off the plunder; at length their leader, Maketu, was shot through the head, on which they immediately retreated. They then resumed their ordinary guerilla style of warfare, stealing the cattle and sheep, and burning down the dwellings vacated by the out-settlers, until, at the expiration of about a fortnight, Governor Grey arrived from Auckland, accompanied by Walker Nene, Te Whero-Whero, and other natives, and bringing with him reinforcements, both military and naval. An encounter took place on the 19th of July, in which the loss on the side of the Europeans was two killed and twelve wounded; that of the natives was supposed to be considerably more, an unusual circumstance, the British having on previous occasions been the greatest sufferers, even in respect of the amount of bloodshed, and in all other points incomparably so; the impracticable nature of the country leaving them no resource but to remain in fortified positions, until the enemy should see fit to come and attack them; their opponents, meanwhile, sustaining no injury but what might result from contests provoked by themselves, or from the temporary deprivation of such articles of convenience or luxury as their advance in civilization should have rendered customary and valuable to them.

How little interruption to their ordinary pursuits had been occasioned by the warfare which had well-nigh completed the ruin of the remnant of the unfortunate band (consisting at first of about 600 persons, but at the commencement of these hostilities reduced to less than 200,) who had been induced by the delusive promises of the New Zealand Company to locate on the disputed Wanganui territory, may be understood from the following facts. No sooner had peace been proclaimed and intercourse resumed between the natives and the colonists on a friendly footing, than the former poured in supplies of potatoes for sale, and that very year are stated, on trustworthy authority to have reaped nearly 2,000 acres of wheat, all of which must have been planted during the most active

* Bishop Selwyn, in a letter to Governor Grey, (Parl. Papers, July, 1849, p. 38,) states that the only two instances upon which he had ever offered any remarks upon the acts of the government, were the military executions at Porirua and Wanganui.

† From March, 1845, to July, 1847, the total loss on the side of the British was 85 killed and 167 wounded. According to the governor's estimate, every 100 men who fell must have cost at least £10,000.

part of the war.* Governor Grey instances the proceedings at Wanganui, as clearly showing how much the settlers were still dependent upon the natives, and how essential it was that nothing should be done, which by alienating the affections of the great mass of the native population, should drive them all into open rebellion.† This conclusion was precisely the same that Governors Hobson and Fitz-Roy had previously arrived at, and Captain Grey, acting upon the same principle as his predecessors, took the course which common sense and common honesty alike dictated. It had been by this time clearly ascertained that the only rallying cry which would unite the scattered tribes of New Zealand, and induce them to commence a war of race, would be any attempt on the part of the government to assume a territorial right over their land. The shadow of the land was to go to Queen Victoria, the substance to remain with them; this had been their original, their only reading of the treaty of Waitangi—from it they had never swerved. That construction they had been assured by the missionaries to be the true one, and successive governors, the bishop, and the chief-justice, in answer to frequent appeals, had invariably repeated the same assurance of the total absence of any intention on the part of the crown, to encroach upon their territorial rights, or infringe upon the spirit or the letter of the treaty of Waitangi.

The question once settled, that all lands desired by Europeans, whether by government, by associations, or by individuals, could not be obtained without the full and free consent of the native proprietors; and the fact established, (as it had been, most satisfactorily,) that those proprietors were ready and willing to dispose of it on very moderate terms, the governor's path would seem to have been as straightforward as could be desired—a little more to be expended on the natives, and a great deal less on military defences, that was all. Unhappily for the three parties most deeply interested—the government, the colonists, and the natives—there was yet a fourth, now more influential than ever, whose mischievous policy had long threatened to produce exterminating warfare. The extraordinary

powers vested in the hands of the New Zealand Company by the agreement of 1847, had raised much serious and well-founded apprehension throughout the colony, and Lieutenant-governor Eyre, on becoming acquainted with the clause (see p. 243,) by which the government surrendered to the Company all the crown lands in the Middle and Southern Island, during a certain period, as well as the exercise of the crown's right of pre-emption of lands therein situated belonging to the natives, and undertook to *execute any grants, leases, or mortgages, for which the Court of Directors and Commissioners should engage*;—immediately addressed the Governor-in-chief on the subject, requesting him to observe, that the last promise was quite unconditional, no reference being made to the natives, either with regard to the reservation to them of the lands they occupied and cultivated, or the purchase from them of their interests in those over which they claim a general ownership. He adds, "I need hardly point out to your excellency how impossible it will be for a Court of Directors and a Commissioner, resident in London, to ascertain or decide what are the just rights of the natives; and still less need I urge, how utterly impracticable it would be to put the New Zealand Company in possession of the lands which might be granted them, unless those rights are *first acknowledged and satisfactorily disposed of*. No one who has not been in New Zealand, can have any true idea of the real state of this subject, or of the many difficulties and disasters which cannot but occur, if a summary and final decision upon questions connected with the land be made in London, and ordered to be carried out by the local authorities here. I feel quite satisfied, that no number of troops which England can send, would be sufficient for the purpose, if those decisions are not founded upon the circumstances actually existing in the colony, and based upon the strictest justice." Governor Grey, in reply, stated that the crown had only undertaken to place its own rights at the disposal of the Company, and was, consequently, not bound by the agreement to any interference with the rights of any third party, whether natives or Europeans.‡

* *Vide* Letter of Lieutenant-governor Eyre, before referred to (p. 249), and published in the *Colonial Intelligencer, or Aborigines' Friend* of September, 1848, p. 82.

† Parliamentary Papers on New Zealand, published December, 1847, p. 55.

‡ Parliamentary Papers relative to New Zealand, published in 1848, p. 19.

This, however, though true and satisfactory to a certain extent, was very far from affording a sufficient explanation of the main point at issue; namely, what the territorial rights delegated to the Company actually were. The definition of the vague terms "crown," "waste," and "unoccupied" lands given by that body was equally comprehensive and convenient. They considered that the demesnes of the crown would be found [or made] to comprehend almost the whole of the Middle Island, and with partial exceptions, all the land in the vicinity of the Company's settlements on the Northern Island; and that consequently large tracts, in addition to the Company's own estate, would be instantly placed at the command of the directors.*

This view of the case their principal agent, Colonel Wakefield† and his successor, Mr. Fox, urged with great pertinacity, maintaining that the government were bound to put the Company in possession of a certain amount of lands, to be obtained either by confiscation or purchase from the natives, but in either case to be bestowed gratuitously on them. The instructions of Governor Grey were, however, quite incompatible with these expectations. He had been directed to retain the exclusive management of all negotiations with the natives for the sale of their lands; and informed that when any transactions of this sort were concluded in the Southern Province, the New Zealand Company were to provide the means of payment from funds placed at their disposal, and to have the disposal of the lands so acquired.‡ When, therefore, Lieutenant-governor Eyre informed him that Mr. Fox maintained that her majesty's Secretary of State for the Colonies had "laid it down as an incontrovertible position" that the natives were only entitled to a proprietary right in such lands as they actually occupied, according to the definition of "occupation" given in the royal instructions, and that consequently the title of the crown to nearly the whole of the Middle and Southern Island, ought at once to have been asserted by the local government on behalf of the Company, who would thereby have been spared the necessity of laying out large sums of money in negotiating purchases from the natives,§ he at

once appealed to Earl Grey. In an able despatch, dated March, 1849, he expresses his fear that the Company might "continue to endeavour to compel the government to adopt principles which could not be carried out without giving rise to a war, for causing which no responsibility would rest upon the New Zealand Company, nor would they be liable for the heavy expenses which it would occasion. The succeeding paragraphs are too important to admit of abridgment, especially as the greater part of them refer to questions of immediate and primary importance:—

"Your lordship will, I think, see that the present arrangement with the New Zealand Company creates a state of things which must cause confusion and disaster. It might have answered as a temporary arrangement for the purpose of winding-up the affairs of the New Zealand Company with the late agent of the Company, who acted in entire accordance with the government; but the welfare and peace of a country ought not to be left dependent upon the fortuitous occurrence of a state of things which cannot be expected to continue uninterruptedly. Moreover, such an arrangement would, under the most favourable circumstances, create great discontent, not only in these settlements, but in the neighbouring colonies, as I think it might be regarded as a very dangerous precedent to hand over the land-fund of a colony to entirely irresponsible persons.

"Upon the whole, I think that nothing could be more conducive to the future welfare of this colony than to allow the Crown lands to be sold here as in the other Australian settlements, by public competition; to cause the proceeds of the sales of those lands to be paid, in the usual manner, into the public treasury; and then to allow fifty per cent. of these proceeds, after deducting the cost of the purchase and administration of the waste lands of the Crown, to be devoted to the purposes of emigration: twenty-five per cent. to be expended for the benefit of the natives, and twenty-five per cent. to be expended upon public works in those provinces where the amount of the native population might render such an appropriation of the land revenue necessary; it being further provided that the last amount of twenty-five per cent. should be expended in aid of the object to which it was to be devoted, in such a manner as the legislature of each province might direct. I have been particular in stating that it should be required that twenty-five per cent. of the land-fund should be spent upon public works, because this colony differs from the Australian settlements in having in it a large number of native labourers, who are at once controlled and improved by having employment afforded to them upon the public works. If your lordship would sanction such arrangements as I have above proposed, I am sure they would work well for a long series of years; and whilst they would eminently promote the interests of the

* This statement is made in the twenty-seventh (printed but not published) Report of the Directors of the New Zealand Company, p. 3.

† Colonel Wakefield died suddenly at Wellington, September, 1848.

‡ Earl Grey, Despatch 19th June, 1847.—*Vide* Parliamentary Papers of June, 1847, p. 115.

§ Letter of Mr. Fox to Lieutenant-governor Eyre, February 20th, 1849.—*Vide* Parliamentary Papers of 1850, p. 72.

colony, they would, I think, be in all respects satisfactory to the European and native populations.

"I should mention to your lordship, regarding this tract of territory which the New Zealand Company, through their agent, contend should have been taken from the natives without their consent, that its area comprehends several millions of acres; and that the sum to be paid for the purchase of any rights which the natives might have over any portion of this territory, except the small reserves kept for their use, was only £2,000: an amount which the late Colonel Wakefield concurred with me in thinking was a fair and just amount to give the natives.

"To act upon the principle that, where the natives are so weak that they cannot defend their lands, the government should assert what the New Zealand Company now represent as the rights of the crown, and forcibly take the natives' lands from them; and again, to refrain from asserting the so-termed rights of the crown, when the natives are so strong that they could protect themselves, would certainly acquire for the government the contempt as well as the distrust of the whole native population; and that especially when, as in the present case, the natives made no factious opposition to the occupation of their lands, but cheerfully yielded all their rights for that sum which, without consulting their wishes, the government had fixed as a just amount."

In this same despatch there are other passages, illustrative of the mischief which could not but result from depriving the local government of the colony of powers essential to its efficient administration, and clearly showing how just the reasoning of Governor Fitz-Roy had been on the subject. Had the results of his painful experience, published by him in 1846,* exercised their due influence, nearly a quarter of a million would have been saved to the British treasury; the energies of an important colony would not have been crippled by a heavy mortgage laid on its lands, the first and most available resource of a young country, and the New Zealand Company might at once have taken its place in history by the side of the South Sea Company.† He had truly declared that while there was an irresponsible commercial body whose object was selfish and local, operating either as a middle-man between the government and the colony, or as an officious helper of the government, for the sake of its own advantage, there could be no peace or confidence. Captain Fitz-Roy's opinions with regard to the pecuniary prospects of the Company have proved equally correct. Although at that time a very opposite view of the question was generally entertained, he asserted that their colonising operations in New Zealand, however assisted by the government, must be

attended with disadvantages and pecuniary loss, and that the sooner they ceased to act the better it would be for themselves, the settlers, and the natives. Happily for the colony, Governor Grey agreed with his predecessor in considering that to take land from the natives, or without the full consent of all its numerous owners, would involve in hostilities, not only the takers, and those who attempted to settle there, but also the local government; and the home authorities supported him in obliging the Company to make purchase, and not confiscation, the means of acquiring territory, and in requiring them to furnish the requisite funds. To this cause the Company choose to attribute the chief blame of the disastrous failure in which their three years' probation terminated on the 5th of April, 1850. After an unavailing attempt to obtain from Earl Grey additional pecuniary assistance, in the form of a guarantee of interest upon this capital, and also a remission of the claim of her Majesty's government upon them, for the advances already made, the Company surrendered their charter, and declared themselves unable to continue their operations, having exhausted the £236,000 advanced to them, under the loan acts of 1846-'7, as well as the sums they had received for land in the Otago and in the projected Canterbury Settlement. Anything approaching to a clear and full statement of the manner in which all this money has been expended, will probably never be given to the public, unless through the instrumentality of some energetic members of the legislature, whose love of truth, and genuine interest in the welfare of a distant colony shall lead them to hazard incurring no small amount of trouble and annoyance, by bringing about a parliamentary inquiry, into the proceedings of the New Zealand Company.

The parliamentary commissioner (Mr. Cowell) appointed under the agreement of 1847, ceased to act some time before the final crisis arrived, and his reports to the Colonial Office have not been published. The only account of the Company's financial affairs, from 1847 to 1850, which I have been able to obtain, is contained in the (unpublished) twenty-seventh report of the directors to the proprietors. It is very brief, and given under such general heads,

* In a pamphlet from which we have previously quoted, entitled *Remarks on New Zealand*, by Robert Fitz-Roy. W. and H. White Pall Mall, London.

† Of 1725. "Among many points of resemblance, each Company employed lotteries and great exaggerations."—*Remarks on New Zealand*, p. 59.

that it shews little more than that the receipts have been enormous, and the expenditure commensurate; but the results—what are they? It states that the Company had a balance in hand, on the 6th of April, 1847, of £37,449 : 7s. : 1d., of which £9,093 : 14s. : 10d. consisted of promissory notes not immediately available. From this date to the 5th of April, their receipts were—

From sale of land	£25,457	10	0
From sundry persons, freight, and passage-money, per ships despatched to New Zealand	28,498	8	5
From interest on investment, bills receivable, and debts due to the Company	3,222	11	11
From her Majesty's government, balance of loan of £100,000 authorized by parliament in 1846	20,000	0	0
From her Majesty's government, amount of loan authorized by parliament in 1847	136,000	0	0
Available balance in hand	28,355	12	3
Total	£241,534	2	7

Their expenditure during the same period, is stated at £203,391, irrespective of £25,000 "invested in the three per cent. consols, in respect of the Nelson trust funds, according to the trusts of an indenture of the 8th of June, 1848, of advances to the Canterbury Association to the amount of £8,621, and a cash balance of £4,522."

Of the £203,391, we find that £68,215 were paid away for accounts outstanding on the 5th of April, 1847; viz., £54,000 for debentures; £3,153 interest on ditto, and £11,062, for bills under acceptance, arrears of salaries, and allowances for services, &c.

Establishments and expenses in England for the three years, are put down at the preposterous amount of £22,032 : 4s. : 7d.; viz., salaries and allowances for services, £12,559; office expenses and contingencies, £5,550 : 12s. : 11d.; law and parliamentary expenses, £3,921 : 17s. : 8d.

To whom, and for what services rendered in England, salaries and allowances to the amount of more than £4,000 per annum were paid, it is not easy to conjecture.

Establishments and expenses in New Zealand are stated at £12,700 : 19s. : 1d.; viz., salaries and allowances for services, £8,765 : 2s. : 0d.; office expenses and contingencies, £3,646 : 2s. : 3d., and law expenses, £289 : 14s. : 10d.

The other important items are, *emigration service*, £47,338; *surveys*, £14,433; *public works in the colony, roads, bridges, &c.*,

£1,175; *colonial incidental expenses, principally for the Otago settlement*, £6,808; *stores shipped to the colony, principally for Otago, and oil butts and live stock, per sundry ships despatched*, £4,200; *land purchased from private individuals*, £8,106; *land purchased from the Nanto-Bordelaise Company* (proprietors at Akaroa), £5,769; *land purchased from the natives*, £7,983.

The general public, as well as the proprietors and land-purchasers of the Company, have, without doubt, the right to demand from the directors more detailed information on the various items above stated, and especially respecting the tangible results which have been produced, by such an enormous expenditure.

For instance, 2,485 emigrants are stated to have been conveyed to New Zealand by the Company, and the *emigration service* is put down at £47,338, but it is impossible to form any idea of the number to whom free passages were granted, or the expense of their conveyance per head, without first ascertaining how many paid their passage, entirely or in part. Again, respecting the surveys, it should be stated where they were executed, how many acres had been surveyed, and whether of grass or unwooded land. What are *colonial incidents*, absorbing six times the sum spent on *roads and public works*? Had the New Zealand Company its "secret service?" The (comparatively) paltry expenditure on public works of £1,175, contrasts yet more strikingly with the £34,733 lavished on *establishments, contingencies, and law expenses* in England and New Zealand. Who are the *private individuals* to whom more money has been paid than to the natives for the whole of the Middle Island, minus their reserves—How many acres had each private individual, where situated, and how acquired?

The affairs of the New Zealand Company demand immediate and most careful consideration. They are not by-gone matters, relating only to the past history of the colony; unhappily they bear upon its present position, and threaten seriously to impede its future progress.

As the case now stands, the Company, by relinquishing their charter, would appear not only to have released themselves from their public debt of nearly a quarter of a million, and of their liabilities to the Nelson settlers and others, at the expense of the government, but are to have a mortgage to

the amount of another quarter of a million (£268,000), on all the crown lands of New Zealand; together with interest at the rate of three-and-a-half per cent., (see agreement, pp. 243, 244.)

This arrangement, if not altered while there is yet time, can scarcely fail to be peculiarly grievous to the Auckland and other colonists who have never had any connection with the Company. In the southern settlements the hardship is less, though even there it cannot but be painfully felt. The latest local papers express an anxious desire to receive official notification of the fact of the Company's dissolution, notwithstanding the heavy *post obits* they leave to be discharged. They state that not one public work, not one substantial improvement worthy of a Company to whom so much had been entrusted, will remain to remind future colonists of its career. "They will only bequeath a legacy of promises unfulfilled, of pledges broken, of trusts betrayed."*

It is deeply mortifying to consider how different the results might have been, had the government itself conducted the colonization of New Zealand. Putting aside the question of why £236,000 of the public money, should have been exclusively devoted to directing the stream of emigration to this particular colony, and supposing her Majesty's ministers to have determined on so doing, not only might ten times the number of persons have been placed there at the same cost, but each one might have been enabled, in his turn, to benefit the mother country, by becoming a consumer of her manufactures to fourfold the extent the majority of those impoverished by the pernicious system of the New Zealand Company, are ever likely to do.

For example—had a grant of one hundred acres of land been offered, on condition of occupation, to any man desirous to proceed thither accompanied by wife or sister, 23,600 couples of enterprising and productive colonists might have been settled there, for the aforesaid £236,000; as grass land on the east coast of the Middle Island might have been fairly purchased from its native proprietors, surveyed, and delivered by the government to each individual, at a cost of 2s. per acre, or £10 the section.†

Or,—had the government offered a section

of fifty acres of land as a grant, and half the expense of the passage of each couple of emigrants as a loan, with a promissory title to their section at the outset, and a complete one when the loan should be repaid; then, allowing £5 for the section, and £20 for the half passage, 9,440 couples of colonists might have been established under the most favourable circumstances.

Or, supposing a third system,—had the government offered a free passage to a couple, as an advance or loan, of £32 in amount, (£16 each,) and a section of land of fifty acres, as a grant, to be the freehold property of the emigrant so soon as the passage cost of £32, with interest at three-and-a-half per cent., should be repaid; then, at an expenditure of £37 per couple, 6,378 couples of adults might have been placed there, and either by repayment of the money advanced, on the acquisition of the freehold, or of a rental equivalent to the interest, the original sum of £236,000 would be perpetuated, and afford a renewed fund for the same object.

The numbers and condition of both races, and the remarkable progress made by the Maories in the peaceful pursuits of civilization, remain to be noticed in the population section; one important fact calculated materially to affect their joint welfare must, however, be stated here:—in August, 1848, Earl Grey directed the governor of New Zealand to ascertain whether the colonists would be disposed to receive "exiles with tickets-of-leave." Public opinion was decidedly, but temperately, expressed in different parts of New Zealand, by both the Europeans and natives. Sir G. Grey, the governor, in a despatch dated the 8th of May, 1849, forcibly stated the evils which would ensue, not only as regarded the aborigines, but also in the demoralization of the exiles, who would probably retire into the interior, live among the native population, and cohabit with their women; whereupon Earl Grey declared (in a despatch, 26th November, 1849,) that her Majesty would not be advised to send any convicts to New Zealand.

Disposal of Land.—Since the cessation of the New Zealand Company, the method of disposing of the lands of the colony may be considered in a state of transition. It has been seen that the Company, in 1847, had

Tuckett, whose experience in the cost of purchasing and surveying land in New Zealand enables him to form a correct judgment on these points.

* *New Zealand Spectator and Cook's Strait Guardian*, for October, 1850. See also *Southern Cross*.

† This estimate is given on the authority of Mr.

superseded the government in the southern province, having been granted extraordinary privileges with regard to the disposal of land, which they surrendered in 1850; consequently the statutory rules abrogated for a time on their behalf then again came into operation. The Otago and the Canterbury Settlements have, however, their own special regulations, and the government market for land is liable to be disturbed by the quantity thrown into the market by the holders of land orders who have never gone out to take their allotments, or have been forced or induced to part with them.

Regulations for depasture and timber licences were issued in August, 1848; but they were withdrawn, and others substituted for them by proclamation of the governor-in-chief, on the 2nd of November. By the regulations as so amended, the licence for a defined run costs £5; that for depasture on common lands, 10s. 6d. The yearly assessment for the animals depastured, payable in advance, according to registered returns, is for each head of great cattle, including horned cattle, horses, mules, &c., 8d.; for each head of small cattle, including sheep, goats, and swine, 1d. The method of proceeding is as follows:—a person desiring to occupy a defined run, having obtained from the surveyor-general a certificate that the land belongs to the crown, and is unoccupied, lodges it with the commissioner of crown lands. If the run remains four months unused, it may be claimed by another party. The occupation is not to interfere with the crown's right to sell any part of the run; and the purchaser of any portion is entitled, in the neighbourhood of his station, to pasturage for sixteen head of great and one hundred head of small cattle, for each eighty acres of purchase. Runs supposed to possess any peculiar value are to be let by public auction.

There are special rules applicable to those tracts of land, which are within the limits of proclaimed hundreds. There the right of pasturage is to be granted exclusively to occupants under grants of land within the hundred, and to the New Zealand fencibles, and the natives and half-castes occupying lands by permission of the government.

Timber.—Persons occupying waste lands for the felling of timber, pay a licence of £5. The district covered by a licence is marked out by the commissioner of crown lands. No fresh application for a licence is to be allowed injuriously to interfere with a

forest on which any other person has expended capital and labour, and no one is to be allowed to cut or remove timber on the crown lands reserved by government for the public use.*

To the history of this colony, the following chronological summary of its leading events may perhaps be appended with advantage:—

New Zealand discovered by Tasman	1643
Re-discovered, and circumnavigated by Cook	1769
Commencement of intercourse with N. S. Wales	1791
Church Mission established by Mr. Marsden at the Bay of Islands	1814
Wesleyan Mission established at Wangaroa	1822
Appointment of a British Resident (Mr. Busby)	1832
National flag adopted by the New Zealanders, and recognised by Great Britain	1834
Declaration of Independence	1835
Roman Catholic Mission established at the Bay of Islands	1838
Settlement of Wellington established	1839
Appointment of Capt. Hobson as British Consul and Lieut.-Governor	1839
Treaty of Waitangi	1840
New Zealand created a British colony, and Capt. Hobson appointed Governor	1840
French settlement established on Bank's Peninsula	1840
Seat of Government fixed at Auckland	1840
New Zealand Company incorporated by Royal Charter	1840
Settlement of New Plymouth established	1841
Settlement of Nelson established	1841
Dr. Selwyn first Bishop of New Zealand arrived	1842
Death of Governor Hobson	1842
Captain Fitz-Roy appointed Governor	1843
Wairau catastrophe	1843
Bankruptcy of the New Zealand Company	1844
Destruction of Kororarika, or Russell	1845
Hostilities at Ohaio-Wai	1845
Recal of Governor Fitz-Roy	1845
Appointment of Governor Grey	1845
Taking of Kawiti's Pah at Rua-peka-peka	1846
Hostilities in the Valley of the Hutt	1846
Parliamentary Loan of £100,000 to the New Zealand Company	1846
Charter and Royal Instructions for the better government of New Zealand	1846
Mr. Eyre appointed Lieut.-Governor of New Munster, the Southern Island	1846
Act passed to suspend the Charter for five years	1847
Act conferring extensive powers on the New Zealand Company, and authorising a loan of £136,000	1847
Hostilities at Wanganui	1847
Settlement of Otago established	1847
Canterbury Association formed	1848
Earthquake at Wellington	1848
Local Legislature established at New Munster	1848
Canterbury Association incorporated by Royal Charter	1849
New Zealand Company surrender their charter to government	1850
Settlement of New Canterbury established	1850

* For further particulars respecting disposal of land in New Zealand, vide latest *Reports of Emigration Commissioners*, and likewise an excellent little work, entitled the *Emigrants' Manual*, published by the Messrs. Chambers.

CHAPTER II.

POSITION—AREA AND PHYSICAL FEATURES—THE NORTHERN, MIDDLE, AND SOUTHERN ISLANDS—THEIR COAST-LINE, HARBOURS, RIVERS, MOUNTAINS, AND LAKES—GOVERNMENTAL DIVISIONS—SETTLEMENTS—CHIEF TOWNS, AND GENERAL TOPOGRAPHY

THE islands included under the general name of New Zealand, are situated in the South Pacific Ocean, about 1,200 miles to the eastward of Australia. They lie between the parallels of 34° and 48° south latitude, and the 166th and 179th meridians of east longitude, forming a narrow serrated chain of about 1,200 miles in length. There are two principal islands, viz.:—*New Ulster*, *North Island*, or *Eaheinomauwe*, and *New Munster*, *Middle Island*, or *Tavai Poenamoo*; from the southern extremity of the latter, a third much smaller island, called *New Leinster*, *Stewart's*, or *South Island*,* is divided by a channel called Foveaux Strait. *New Ulster* and *New Munster* are separated by Cook Strait; at the narrowest part of this passage the direction of the opposite headlands and the identity of structure, show that they were once contiguous, and the submerged reefs yet mark far into the strait the previous line of connection.

The total superficies of New Zealand is estimated at about 95,000 square miles, giving an area nearly equal to that of the British Islands, bounded by a coast line of above 3,000 miles in extent. The country is excessively mountainous: a lofty chain traverses the Middle and a considerable part of the Northern Island, beside which, there are many subordinate ranges. Numerous and copious streams descend from the mountains to the sea-shore, but are, unfortunately, not navigable for ships, as above the tide they are, with few exceptions, mere mountain torrents barred at the entrance by vast deposits of shingle, through which the waters filtrate to the ocean.

In the Northern Island, the principal

* The names assigned to these islands are very unpopular, but they have this advantage for the reader, that they are calculated to keep in mind the relative position of the islands, Ulster standing for Upper, Munster for Middle, and Leinster for Lower.

† D'Urville, in his *Voyage Pittoresque autour du Monde*, has vividly portrayed the impression made upon his mind, on visiting some portions of the coasts of New Zealand, by the extreme stillness and solitude. "Du reste à ces faibles hauteurs le règne animal

rivers, for the most part, flow north and south, and have an extensive course, in proportion to the limits of an insular area, some reaching to a length of 100, and even 200 miles. In the Middle Island the chief streams have a course inland in a direction always nearly at a right angle to the line of coast, and have consequently a less extent. Thus the rivers which discharge on the north coast flow from the south, on the east coast from the west, on the south coast from the north, and the west coast from the east.

The aspect of New Zealand is very varied; in some localities and from certain points of view, snow crowned mountains and stately forests give it grandeur and majesty. More generally its scenery is simply picturesque, consisting principally of fern-clad ranges, with intermediate valleys of varying but usually limited extent, whose available area is frequently encroached upon by extensive swamps overgrown with flax, reeds, and rushes; in exceptional instances, vast treeless but grassy plains, impart to it an air of sameness and monotony which is greatly augmented by the absence of animal life, which distinguishes certain parts of these islands.† Terry, describing the leading characteristics of the country, says:—

"The exaggerated statements circulated in England of the colony and its productions, soil, and climate, have led generally to the very erroneous impression and opinion, that the necessities, and even more, as regards food, would be abundant and cheap. But New Zealand has neither a tropical climate, nor is it a country in which edible vegetables and fruits, indigenous to such regions, grow and flourish spontaneously and abundantly: nor is it a land inhabited by native animals adapted for the food of man, and easily obtained by the toils or chase. The islands of New Zealand are uncultivated wastes,—either of semblait lui-même frappé d'impuissance. Plus d'oiseaux, point d'insectes pas même de reptiles de la plus petite espèce. Aussi, en résultait il un silence lugubre et absolu, une immobilité profonde qui font éprouver un voyageur les sensations les plus singulières. On dirait une nature morte et pétrifiée, une terre où nul être ne peut vivre, si ce n'est quelques plantes rabougries." This description is however only partially applicable to the shores of New Zealand, of which Cook frequently gives very pleasing accounts.

mountains covered with dense forests,—of plains and lowlands covered with high-fern and shrubs,—or of swamps and marshes covered with rush and flax, without any open spots of grass land for pasturage, or of verdant downs and hills for sheep. In these vast tracts there is not to be seen a living animal, wild or domestic. The traveller's path in the woods is never crossed by the bounding deer for his rifle to replenish his supplies, nor is his nightly bivouac ever disturbed by the howl or the dread of visits from more savage and ferocious animals. All is perfect silence, and solitude in the extreme. The woods are comparatively destitute of the feathered race. The pigeon, the parrot, and the *tui* in certain localities, are the only species that abound. Whatever is produced from the soil in New Zealand for the food of its population, either of grain from arable land, or of stock from pasturage, must be the work of time, by great labour and at much expense. The very nature and circumstances of the country must render the progress of agriculture in New Zealand slow and gradual.*

This account was written in 1842, when the extensive, though not numerous, grassy plains of New Munster were unknown; since that time several more limited tracts of natural pasturage have been discovered in New Ulster.

Forest, thick woods, impervious jungle, flax and fern, stunted or luxuriant, according to the soil, cover the chief part of the whole surface, which is intersected by innumerable water-courses, and adorned by cascades and waterfalls. Extensive lakes, the evident results of volcanic agency, are situated in the interior of both islands, and from them the principal rivers derive their source.

The general outline of the islands of New Zealand (especially the Northern,) is so striking, that the most casual observer can scarcely glance at their representation on a map, without being impressed by their strange, irregular, unaccountable shape. The coast scenery is varied, sometimes very pleasing, at others quite the reverse, the eastern being generally far more inviting to the navigator than the western shores.

NEW ULSTER, OR NORTH ISLAND, is about 400 miles in length, with a breadth varying from 5 to 300 miles. Its area is estimated at 31,174,400 acres; a very large proportion of the whole is occupied by precipitous hills and water-courses, which latter, though valuable as affording an inexhaustible supply of water-power for machinery, serve to increase rather than diminish the great disadvantage of New Zealand, namely, the difficulty of communication by means of roads. An intelligent writer,† describing the

excessively mountainous character of the island, pictures the immigrant agriculturist landing on a circumscribed flat, gazing for the first time on his future home, cogitating whether he can himself ascend the hills, and anxiously inquiring how horses and ploughs are to work in such a country. There are very few plains, properly so called, in New Ulster, though the broad top of a mountain or a confined vale is frequently so designated; for this reason the landscape is of slight extent, mostly a miniature of Wales, eminences too frequently obstructing the view. Sometimes these vales are like the bottom of a caldron, of which the surrounding hills form the sides.

The remarkable configuration of the island gives it an extent of coast-line quite disproportioned to its area. Peninsulas of various shapes and sizes stretch out into the ocean from every point of the compass, the largest of which (nearly 200 miles in length) is united to the main land by a low sandy isthmus about three miles broad. This peninsula, the extremity of which is called by the natives *Te Muri-wenua*, or *Land's End*, terminates in *Cape Otou*, or *North Cape*, a rocky promontory which forms the northern limit of New Zealand.

Coast-line and adjacent country, harbours and rivers.—*North Cape* is situated in 34° 25' S. lat., and 173° 10' E. long., off it lies a small rocky island, named *Moudi Moutou*, separated from the mainland at high-water only. The promontory itself is high and bold, presenting very steep sides to both the northern and the eastern coast; but a flat and swampy land of about three square miles in extent, runs from the northern to the eastern coast, and separates this promontory from the hills at *Kapowairua*. The eastern coast from the North Cape to *Parenga-renga* estuary, situate in the curve of the coast, called *Sandy Bay*, is formed chiefly by perpendicular cliffs of grey sandstone. The arms of *Parenga-renga* inlet extend between the ramifications of the neighbouring hills, and generally terminate in swamps grown over with what is called the New Zealand mangrove (*avicennia tomentosa*). Proceeding in a southerly direction, the east coast is lined by a long sandy beach, here and there interrupted by bluffs of basaltic rock, which are verdant with groups of the hardy pohutukaua tree

* *New Zealand*, by Charles Terry, F.R.S., F.S.A., p. 58.

† John Bright, Esq. *Vide New Zealand, its State and Prospects*, pp. 5, 6.

(*Metrosideros tomentosa*) to about eight miles to the southward of *Houhoura*, or *Mount Camel*. The land consists either of low hills or swamps, the low brown vegetation of the former being almost wholly fern or manuka.

Mount Camel (so named from its form) is not connected with any chain of mountains, but forms an isolated hill rising to the height of about 500 feet above the sea. It protects a deep inlet, which at the head branches off into several shallow channels, and forms a perfectly sheltered harbour for vessels of the largest burden, with anchorage close to the eastern shore; the entrance to this harbour is not more than forty or fifty yards broad. Some miles to the southward, the land suddenly assumes a very different aspect; the raupo swamps and the low barren elevations of the soil between them give way to an extensive alluvial district, which stretches from the eastern to the western coast, and follows the serpentine course of the *Awaroa*, or *Awanui*, a river which empties itself into the estuary of *Rangaunu*, a shallow but extensive arm of the sea, with an intricate, yet open channel for moderate sized vessels. The river is very narrow at its sea-mouth, but the tide drives its fresh-water back eight feet above its usual level, and it is then of considerable depth; it has little fall, and the tide renders it always navigable. The banks are perpendicular, and rise two or three feet above the level of the spring-tides; towards its outlet, however, the land is low and swampy, and is overflowed when winds from the sea raise the water to a higher level, or when floods, occasioned by long-continued rain, come down from the interior. The *Awaroa* has its source near that of *Mango-muka*, a branch of the *Hokianga* river, from which it is separated by the *Maunga Taniwa*, a remarkable pyramidal peak, which towers above the neighbouring hills, being nearly 1,500 feet high. Throughout its course the valley of the *Awaroa* is very fertile. Several miles below *Kaitaia*, a mission-station and native settlement, situated on a hilly eminence about eight miles from the western coast, the river is joined by another, coming from the eastern hills in the neighbourhood of *Monganui*, in *Lauriston Bay*, which at the point of union is scarcely inferior to itself in size. Above *Kaitaia* the *Awaroa* is only passable by canoes, in which the natives carry down

food from their plantations to the village. The flat alluvial land extending on the right shore of the *Awaroa* to *Rangaunu Bay*, is separated from *Lauriston Bay* by *Kari Kari*, or *Knuckle Point*, a peninsula connected with the range of hills which occupies the interior of the island, and sends forth branches both eastward and westward, forming valleys, or rather ravines, through which various mountain torrents find their way to the ocean. The most important place in *Lauriston*, *Doubtless*, or *Oudu Oudu Bay*, is *Oudu Oudu*, or *Oruru*, where a stream, which takes its rise on the eastern slope of *Maunga Taniwa*, and can be entered by a boat, empties itself into the sea. On both sides of this river is excellent level and clear land, rising slowly towards *Maunga Taniwa*. *Oruru* is separated by low hills covered with a stiff white clay and a scanty vegetation, from a similar valley eight miles to the northward, out of which another river runs into the sea. The road from *Oruru* into the harbour of *Monganui*, leads over a succession of steep hills and narrow fertile ravines; the distance is about ten miles. A reef of rocks which runs off *Oruru* in a north-easterly direction, is the only obstacle to a safe and easy entrance into the harbour. The channel is not above 100 yards wide, but it is very deep. A small number of vessels may anchor about a quarter of a mile off the southern head, in five fathoms water, and be perfectly sheltered. The rest of the estuary is a large basin spreading out into mud-flats at low-water, with a channel sufficiently deep for large boats, near the northern shore, up to its head, which is here entered by a river that takes its rise in the hills separating the harbour of *Wangaroa* from *Monganui*. An arm of the latter stretches towards *Oruru*, and unites with this river behind an island of moderate size, which forms the head of the harbour, and conceals the mangrove flats, which lie on both sides of the channel.

The river *Pu-te-kaka* is entered by the tide for about eight miles, and thus far a boat can go up it. It flows through an undulating open country, the elevations alternating with large swamps which might be easily drained, and would then form good agricultural land. Higher up, the view is shut in by the hills towards *Wangaroa*, which are about fifteen miles distant, and are covered with *kauri* forest, as are also the hills to the west and north.

The land up to the base of those hills is devoid of trees. Towards Point Surville the coast is hilly, with occasional narrow valleys; from thence to Wangaroa it is cliffy and steep.* Along it, at the distance of one or two miles, there occur numerous rocks and islets, which usually assume a pinnacled or sugar-loaf form; but some present a castellated outline, like that observable in the rocks of Bass Strait, Australia.†

Wangaroa Harbour, the scene of the Boyd massacre (*vide* p. 119), is a singularly romantic place. The entrance, which is only about 150 yards broad, is between towering, perpendicular rocks, which appear to have been rent asunder by some mighty convulsion of nature. Trees of various kinds overhang these black walls, and form a picturesque contrast with them. Deep fissures penetrate the coast, and on the western side of the bay, high cubical masses are piled one above another, to the height of several hundred feet, from whence many cascades descend, and lose themselves amid the luxuriant groves which clothe the base of these heights. On the opposite side of the harbour is a pyramidal, wooded hill, 300 feet high, excessively steep, and in some places perpendicular, on the summit of which a native fort once stood.‡ Near the northern head is a large perforated rock, presenting the appearance of a deep Gothic archway, through which canoes find a safe passage in calm weather. The water in the entrance is of great depth close to the rocks, and there is no hidden danger of any description. The harbour itself, into which three small streams discharge, is very spacious and deep, affording anchorage for the largest fleet, and shelter from all winds: it ranks with the best in New Zealand; and in beauty of scenery is nowhere surpassed. There is, however, but little available land in its immediate neighbourhood: to the northward the sea forms some inlets with flats, which are overgrown with trees; and Kauri timber is found on the neighbouring hills, but at some distance from the coast,—all that grew near the sea having been cut down and destroyed.

A chain of small islands, called the *Motu Kawa*, or *Cavalles Islands*, stretch from Wangaroa towards the *Bay of Islands*, a distance

* *Travels in New Zealand*, by Ernest Dieffenbach, M.D.; see vol. i., p. 205 to 234.

† *New Zealand*, by R. G. Jameson, p. 181.

‡ Dr. Selwyn remarks that "strangely enough two high and remarkable rocks, laid down in the charts as St. Peter and St. Paul, on opposite sides of the

of about twenty-five miles. The most northerly, which is about three miles from Wangaroa harbour, is resorted to by the natives for fishing; but is otherwise a hilly and exposed spot, of no importance. Anchorage is found near these isles; and, in calm weather, many of the fragile nautilus fish may be seen between them and the main.

The *Bay of Islands*, formerly the favourite rendezvous of the South Sea whalers, obtained its name from the number of rocky islands with which it is studded. Two necks of land, running in a parallel direction, and narrowing towards their extremities, form the entrance to an expanse of water, really about ten miles square, though, to the eye, it appears much smaller, from the many islands that intercept the view. The northern head of the bay, *Cape Wiwiki*, or *Point Pococke*, is a steep, cliffy headland, of a dark colour, rather picturesque in its appearance: near it is a conical, rocky islet, called the *Sentinel*, from its position. The southern headland, distant about ten miles from the northern, is *Cape Brett*, a bold promontory, higher than any neighbouring land. Detached from, but near the Cape, is a rock, named by Cook, *Piercy Islet*, which exhibits another of the remarkable perforations frequent on the eastern coast of New Zealand.

Few places are easier of access than this spacious bay: excepting the *Whale Rock*, whose position is well ascertained, there are no hidden dangers; and, once entered, it affords secure and sheltered anchorage for an almost unlimited number of vessels, in all weathers, and at all seasons of the year. It comprises several distinct harbours, formed by the inlets which branch off from various parts of its circumference. Near the first, or most northerly of these, is *Tipuna* or *Rangehua*, the spot where the first missionaries were established, through the exertions of the Rev. Samuel Marsden, in 1814.

Near the middle of the west side of the bay is the opening of *Kororarika Harbour*, a secure but shallow port, better adapted to merchant shipping than to the use of men-of-war.§ Opposite to the village of Kororarika stands the mission station of *Paihia*, harbour have been bought, the former by the Romanists, the latter by Mr. Shepherd, the Church Missionary Society's catechist."—*Church in the Colonies*, No. vii., p. 12.

§ *Voyages of the Adventure and Beagle*, by Captain Fitz-Roy, R.N.; vol. ii., p. 565.

a lovely little hamlet, situate at the foot of high fern hills. The arm of the sea, or estuary, which forms Kororarika harbour, affords, at its termination inland, excellent anchorage for vessels not requiring a depth of more than seventeen feet.* It then diminishes, and its salt stream gives place to the fresh waters of the *Kawa-kawa*, which can be ascended by boats for about four miles; the river then narrows, and takes its course through low and swampy ground, becomes shallow, and very much choked up with the roots and stumps of trees. Though on a small scale, the banks of this river are interesting. On each side the soil is extremely good on the low grounds, and the hills well wooded; they are not high, but approach the river rather closely in some places, so that the winding stream, spaces of level and cultivated land, and woody heights are agreeably mingled.

The same estuary that forms the channel of the *Kawa Kawa*, branches out in a somewhat parallel direction, receiving the *Waikadi*, a stream about ten miles in length.

The *Waitangi*, or *Weeping River* (*Wai*, signifying water, and *tangi*, weeping), rises in *Lake Maupere*, and enters the Bay of Islands near *Paihia*; it has a narrow channel, but a rapid course of about thirty miles, and forms fine horse-shoe falls at its mouth. Being augmented during its progress by the drainage of the hill range on either side, it attains, before it reaches the cascade, a breadth of thirty yards. The *Waimate* flows into it from the north-east. Between the *Waitangi* and *Tipuna* another arm of the sea stretches far into the land, and receives a small stream called the *Keri-keri*. This river, although only about twenty yards broad, has a very picturesque fall over a basaltic escarpment, ninety-five feet in height. The spray of the waters gives rise to a vigorous and varied vegetation all around.† The country surrounding the Bay of Islands, consisting almost entirely of hills, which, although not of any great height, are too steep to permit horses and cattle to work, alternating with ravines,

which extend far inland. Towards the coast these hills form diminutive bays, generally inaccessible from the land. The different anchorages being separated, or rather formed by distinct arms of the sea, impedes their being connected by the construction of roads with each other, and with the interior, beside which, there is scarcely sufficient room in any of the bays even for a moderate-sized town, unless placed upon the side of a steep hill. The only exception to the mountainous character is the table land, extending between the *Waitangi* and the *Keri-keri*.

Proceeding to trace the coast-line in a southerly direction from Cape Brett, and passing the harbour of *Wangamumu*, and that of *Wangaruru*, and a group of islets called the *Poor Knights*, we arrive at *Tutukaka*, a small but secure harbour, hemmed in by wooded hills, where the *Nongodo river* has its outlet.

From thence the coast is straight, rocky, and bold, interrupted by a few sandy beaches, as far as *Bream Head*,* or *Cape Tewara*, a remarkable promontory, on whose summit several pointed rocks stand in a range, and being surrounded by shrubs and small trees, resemble the picturesque ruins of an ancient castle; it may also be known by some small islands which lie before it, called by Cook the *Hen and Chickens*, one of which is high, and terminates in two peaks. *Bream Head* forms the northern point of *Wangari Bay*, a fine inlet, which contains an extensive and sheltered harbour, and receives the waters of a somewhat considerable stream, of the same name. Much *kauri* forest is found in this neighbourhood. From thence to *Hauraki Gulf*, or the *Frith of Thames*, the coast presents a series of wooded hills and dark projecting rocks, with white sand-banks between the sea and the firm land.

Cape Rodney, in 36° 15' S. lat., 174° 53' E. long., runs out in a long narrow neck of land, forming the north-west extremity of the gulf;‡ the north-east, named *Cape Colville*, in 36° 26' S. lat., and 175° 27' E. long. rises directly from the sea to a considerable

* On the western side of this harbour is the place memorable for the massacre of the ill-fated Marion and his crew. Captain Fitz-Roy, alluding to this melancholy catastrophe, says, that "it is now said to have been caused by mutual ignorance of language. The Frenchmen not understanding that the spot was tabooed [or sacred], persisted in fishing there, and endeavoured to maintain their intrusion by force."—*Voyages of the Adventure and Beagle*, vol. ii., p. 582.

† "A waterfall is called *Wai-anioaninoa* in the Maori language, meaning *rainbow-waters*."—*Travels in New Zealand*, by Earnest Dieffenbach, M.D., vol. i., p. 250.

‡ The name of the Gulf of Hauraki was originally applied only to the eastern part of the large estuary or gulf, entered between Cape Rodney and Cape Colville, which receives the river Thames, or Waiko, and the river Piako, but that appellation is now generally applied to the whole expanse.

height, and is remarkable for a lofty rock which stands on the pitch of the point, and may be distinguished at a very great distance. These two headlands are about forty miles apart. The broad mouth is defended from the sea swell by a chain of islands of different extent, which lie across it, called by Cook the Barrier Islands. *Otea*, the largest, is about twenty miles in length, and consists of high mountains, broken into rugged and fantastic peaks; a considerable portion of the hills are covered with *kauri* forest and brushwood, but on the western shores there is open land. An excellent harbour is situated on its north-western extremity. At *Aiguilles Point* the rocks jut up from the water like colossal needles; a few miles off lie several small islands. The most westerly of the Barren Islands, and the next in size to *Otea*, is called *Shoutourou*. Entering Hauraki Gulf, at Cape Rodney, and proceeding southward, we pass *Point Wakatu-wenua*, a tongue of land, which forms the northern shore of a small sandy bay, called *Matakana*; four miles off is *Kawau*, a steep rocky island, twenty-five miles in circumference, which possesses copper and some silver ore; but like most of the surrounding islands, though extremely picturesque, is totally unfit for agricultural or grazing purposes, the entire area being occupied by steep hills and gullies, frequently clothed with dense forest or brush. The coast is rocky and indented with many sheltered bays, overshadowed by dark overhanging trees, amidst whose branches sit thousands of shags and cormorants, watching their finny prey in the clear shallows beneath.* *Kiahau Harbour* lies to the south of *Mata-kana*; it receives several small creeks, and affords sheltered anchorage.

The *Harbour of Waitemata*, the most important of the various havens in the Gulf of Hauraki, lies at its westernmost extremity, and is distant forty miles from Cape Rodney, and forty-five from Cape Colville.

AUCKLAND, the capital of the colony is situated on its southern shore, in $36^{\circ} 51'$ S. lat., $174^{\circ} 45'$ E. long.

The land opposite to the town forms a peninsula at high water, from which two conical hills rise, that called the *North Head*, or *Takapuna*, is 216 feet high, of an irregular form, and consists of a hard basaltic rock; the other, at a little distance from

it, named *Takarunga*, is 279 feet high, and consists of black and reddish vesicular lava. A signal station has been erected on its summit, where there is a crater partially broken in. The navigable entrance into the harbour is only three-quarters of a mile wide; it is between a reef, the outermost point of which is marked by a beacon, and an insulated rock, called, from its shape, the *Bastion*, which lies to the eastward of Auckland, and is about five miles distant from another small island or rock, called the *Sentinel*. The depth of the harbour is from six to nine miles in the mid-channel, and from three to three and-a-half at the sides. The inlet continues about ten miles to the westward, stretching its ramifications towards the opposite coast, sending an arm to the northward, towards the river *Kaipara*, and another to the southward, towards the *Harbour of Manukao*, on the opposite coast. The northern arm has a deep, but very narrow channel; shoals and rocks obstruct the southern passage, which can, however, be ascended by boats at high water to its extremity, from whence to Manukao there is a portage of one mile and-a-half. *Rangitoto Island* forms a grand natural breakwater to Waitemata Harbour; it is a triple peaked crater, rising in a conical shape, 920 feet above the level of the sea, and commanding a most extensive panorama of the mainland, and of the many lofty and volcanic islands, which, luxuriantly wooded as they are, and divided from each other by deep straits, give a variety to the scenery of Hauraki Gulf, unusual in New Zealand, in most of whose harbours, steep and uniform surrounding hills shut in the view, and confine it to a narrow space. *Waiheke*, the largest and most fertile of these islands lies to the eastward of Rangitoto and *Tapu Island*, which are divided only by a narrow passage. It is about thirty miles in circumference, and has a harbour for small vessels, while ships of a larger size find anchorage in the channel, between it and the main. Many cultivable valleys are found contiguous to the small sequestered bays, which indent its coast line, and are separated from each other by rocky promontories, covered, like the greater part of its irregular surface, with a dense vegetation, amid which the grey columnar stems of the lofty *kauri* are conspicuous.

A few miles to the eastward of Waitemata Harbour is an inlet called the *Tamaki*, the head of which is only a quarter of a mile

* Angus' *Savage Life and Scenes in Australia and New Zealand*, vol. ii., p. 165.

distant from the port of Manukao. At the entrance into this channel is a bar, with six feet depth at low water, but inside, the passage deepens; vessels of 200 tons can ascend for some distance, and large barges can go to the portage. There is good and level land on either side of the Tamaki, but no timber, only jungle.

Coromandel Harbour is situated nearly opposite the island of Waiheke, on the eastern shore of what is properly called the Frith of Thames, and lies between the embouche of that river and Cape Colville, being thirty-five miles distant from the former, and twenty-five from the latter. It is surrounded by hills, which on the eastward rise in a series of longitudinal ridges to the height of about 1,500 feet. One of the loftiest of these is surmounted by an enormous mass of basalt, which, having a castellated outline, and being visible at a great distance, forms a landmark called the *Castle Hill*. The shore is covered with verdure, and abounds in fine timber; but the harbour itself is better adapted for small than for large vessels, as, on account of the shallowness of the water, ships that require any great draught of water cannot enter far enough to be effectually protected from the outer swell, although there is good holding ground.

The *Frith of the Thames*, to the southward of Coromandel Harbour, is not accessible to vessels drawing above eight feet of water, as there are sand-banks and shallows at the southern extremity, where the Thames and Piako discharge. A mud-bank stretches out between the mouths of these rivers; there is, however, a channel into the Thames, and the tide runs up it nearly fifty miles, rendering it thus far navigable for small craft. Its width, at that point, is nearly equal to that of the English Thames at Richmond; its depth, about six feet, and its current moderately rapid. Boats and canoes can ascend as high as the falls at Mata-Mata, which is, by the river's course, about a hundred miles from its mouth.*

The *Piako* is very inferior in importance to its sister stream, being navigable only for boats. It rises in a hill called the *Maunga-Kawa*, and flows along the eastern slope of the *Maunga-Tautari* range, which runs toward the Gulf of Hauraki, separating the *Valley of the Thames* from that

of the *Waipa* and *Waikato*, on the opposite or western side of the island. The so-called Valley of the Thames is a low tableland, nearly one hundred miles long, and from twenty to thirty broad, bounded on the westward by the aforesaid *Maunga-Tautari* range, and on the eastward by a chain of hills connected with the *Horo-Horo Mountains*, in which the Thames originates. These hills, the most remarkable of which is an isolated eminence, called *Aroha*, or the *Mountain of Love*, are generally wooded to their summits; they rise like an artificial wall between the river, which takes its winding course along their western slopes, and the sea-coast, and extend from the remarkable *Rotorua* district to Cape Colville, terminating to the northward in the long peninsula which forms the eastern limit of Hauraki Gulf, rearing their sharp crests, and presenting their steep rocky declivities on either side, but never attaining a height of more than 1,500 feet.

The Thames receives several tributaries from this ridge, one of which, the *Wai-riri*, or *Foaming Water*, forms a magnificent cascade, falling 800 feet in perpendicular height; another, called the *Ohenamuri*, disembogues at *Opite*, a native village, after flowing through a beautiful valley with hills skirting its banks, abounding with *kauri* timber.

Leaving Hauraki Gulf, and proceeding along the eastern coast in a southerly direction from Cape Colville, the next port is *Mercury Bay*, off the entrance of which lie some isles and rocks bearing the same name. The shores of the bay are very steep, being formed by the eastern declivities of the ridge whose western spurs abut on Coromandel Harbour, from which it is distant overland about sixteen miles. There is sheltered anchorage for small vessels in all winds, but the only part sufficiently deep for ships of large burthen is exposed to the tremendous north-easterly gales, which occasionally desolate this coast. In one of these H.M.S. *Buffalo* was wrecked, in August, 1840, having visited the bay to procure a cargo of spars. A creek of this harbour was called by Cook, *Oyster Cove*, on account of the abundance of that and other shell-fish found there.

To the southward the coast forms the deep curve known as the *Bay of Plenty*. Its aspect is in accordance with its name, the native cultivations often sloping down the gentle hills which skirt the belt of sand

* Dieffenbach's *Travels in New Zealand*, vol. i., p. 410. Terry's *New Zealand*, p. 41.

upon the sea-shore, while the rich *Pohutukawa trees*, (*Metrosideros tomentosa*), with their crimson blossoms, combining the beauties of a forest tree and a garden shrub, give the appearance of an ornamental plantation, instead of the usual bleak and barren features of the coast.* This immense roadstead contains several sheltered havens for small craft. *Tauranga* (on whose shores a missionary settlement, *Te Papa*, has been established,) has four fathoms water upon the bar, but the channel is not more than 100 yards in breadth, and bends at a sharp angle. The southern headland of this harbour is formed by a solitary conical hill, *Maunga-nui*, of about 500 feet in height, connected by low land with the main. The northern head spreads out into low and level ground, and is covered with fern for miles inland. Some islands of considerable dimensions and of the same structure and configuration as the mainland, are separated from it by broad channels. Two or three of these are stated by Dieffenbach to be about seven miles long and three broad; others are mere rocks; their height and that of the adjacent coast varies from forty to eighty feet above the level of the sea. A rugged island with narrow but fertile valleys whimsically named by Cook, the *Mayor*, and a group of islets called by him the *Court of Aldermen*, extend between Mercury Bay and Tauranga Harbour; into the latter several small streams disembogue. *Motiti* or *Flat Island*, forms a harbour called *Louland Bay*, eight miles to the southward of which the *Temou* disembogues after a short course, originating in the hills to the eastward of *Lake Rotorua*.

About thirty miles to the south-eastward, of the *Temou*, is the embouchure of the *Rangitaikai*, and of as small stream called the *Tara-wera*, where there is a mission station, named *Mata-Mata*, ten miles from which, in the centre of a large plain, stands *Putawaki*, or *Mount Edgcombe*, a round eminence, about 7,000 feet high. *Rangitaiki* has several tributaries: about the middle of its course, its volume is increased by the united waters of the *Wirinaki* and the *Okahu*. Beyond *Rangitaiki* the coast forms a curve, called *Highland Bay*, at whose eastern extremity the river *Wakatani*, which rises in a mountain near *Lake Waikare*, and receives, on its right bank, the *Waikare* and the *Waimana*—falls into the sea. *Motuhora*,

or *Whale Island*, in whose vicinity there is good anchorage, lies about seven miles from Highland Bay: to the north-eastward, at a distance of twenty to twenty-five miles from the main, is *Wakari*, or *White Island*, the most remarkable of the numerous volcanic islands which characterize the Bay of Plenty, being in a state of continual ignition, and vomiting forth, incessantly, a huge column of white smoke. It is low, and produces a large quantity of very pure sulphur.

Between the *Wakatani* and *Cape Runaway* are the small bar harbours of *Ohiwa* and *Opotiki*: between Cape Runaway and *Otiki*, or *East Cape*, or *Waiapu*, the coast is intersected by numerous creeks, and indented by several bays, which, however, afford but very imperfect shelter, except when the wind blows off the land. The extensive line of coast between Cape Waiapu, the eastern extremity of New Ulster, in 37° 42' S. lat., 178° 40' E. long., and *Cape Palliser*, or *Kawa-kawa*, its southern termination, in 41° 38' S. lat., and 175° 21' E. long., in the centre of which lies the deep bight, called by Cook, *Hawke Bay*, is not known to possess any haven capable of sheltering large vessels during the prevalence of north-easterly winds; it has, however, as yet, been but imperfectly examined. Soundings have been taken at a considerable distance from the shore, which vary generally from twenty-five to forty-two fathoms, deepening off East Cape, from fifty to sixty, and to ninety fathoms.

The country south of East Cape is fertilized by numerous small streams. The *Waiapu* runs in a broad shingly bed, through a lovely plain of grass and fern land; rich patches of wood are scattered over the higher parts of its valley, which is extremely picturesque, being overshadowed by the double head of *Ikurangi*, supported by its three satellites, *Aurangi*, *Taitai*, and *Wariki*, from whose heights descend the impetuous mountain torrents which, in summer, occasion frequent and sudden inundations. Passing a small, but convenient harbour, named *Tokomarou*, we reach *Haua*, or *Tologa Bay*, which lies about forty miles to the southward of the mouth of the Waiapu, and is described by Cook as moderately large, with good anchorage, and shelter from all winds, except the north-east. The tide rises about eight feet; the width at the mouth, between the headlands, is one mile and-a-half. On the south point lies a small,

* *Annals of the Diocese of New Zealand*, p. 49.

but high island, at the extremity of which, in the entrance of the bay, are two rocks, one round, like a corn-stack, the other long, and perforated in several places, the openings appearing like the arches of a bridge. Fourteen miles to the southward is *Gable End Foreland*, a lofty cliff, brilliantly white, resembling the end of a large building, a short distance from which a rock rises, in the form of a spire. About twenty miles to the south-east is *Table Cape* or *Mahia*, the north point of *Tera-kako Peninsula*, in $39^{\circ} 7' \text{ S. lat.}, 178^{\circ} 7' \text{ E. long.}$; the shore between forms a horse-shoe-shaped inlet, called *Turanga*, or *Poverty Bay*, which is thus described by Captain Cook, who first landed here on the 8th October, 1769:—

"The two points which form the entrance are high, with steep white cliffs, and lie a league and a half or two leagues from each other, north-east by east and south-west by west, the depth of water in the bay is from twelve to five fathoms, with a sandy bottom and good anchorage; but the bay is open to the wind between the south and east. Boats can go in and out of the river [a small fresh-water stream] at any time of the tide in fine weather; but as there is a bar at the entrance, no boat can go either in or out when the sea runs high: the best place to attempt it is on the north-east side, and it is there practicable when it is not so in any other part. The shore of the bay, a little within its entrance, is a low flat sand; behind which, at a small distance, the face of the country is finely diversified by hills and valleys, all clothed with wood, and covered with verdure. The country also appears to be well inhabited, especially in the valleys leading up from the bay, where we daily saw smoke rising in clouds one behind another to a great distance, till the view terminated in mountains of a stupendous height. The south-west point of the bay I named *Young Nick's Head*, after Nicholas Young, the boy who first saw the land."

Bishop Selwyn, describing the shore of *Poverty Bay*, and the bays to the northward, says:—

"The whole of this coast forms a succession of small bays with the most lovely scenery. The general character is a half-moon bay with a rich back ground of wooded hills, sloping down to a firm sandy beach of a warm, reddish-grey stone, which with a bright blue sky overhead (which was generally the case) forms a combination of the most pleasing colours; and with a large party of natives forming themselves into moveable groups, presented a succession of perfect landscapes."

Terakako Peninsula, off whose southern extremity lies *Waikawa*, or *Portland Island*, a small island, with which it is almost, if not quite, connected by a rocky ridge, is united to the main by a low, narrow neck of

land, and forms the northern entrance of the deep and wide inlet called *Hawke*, or *Wairoa Bay*, in which there is a depth of seven to twenty-four fathoms, and good holding ground.

The *Wairoa*,† a beautiful river, winding through an extensive plain, receiving several tributaries, and communicating with a chain of inland lakes, falls into this bay, in which the channels of many small streams likewise terminate. To the southward of the *Wairoa* is the pretty valley of *Arapaonui*, in whose vicinity are a succession of cliffs, or rather sandstone hills, which formerly were some way inland; but, by the encroachment of the sea, have been cut in two, and consequently drain inwards, occasioning the water to be lost in the dry soil, instead of flowing down to the beach. Bishop Selwyn speaks of having here had difficulty in obtaining water—a rare case in a country distinguished for the frequency of its pure and gushing streams.§ *Ahuriri Harbour* lies twelve miles south of *Arapaoni*. A few miles beyond, the *Tukituki* disembogues, after receiving four tributaries—the *Makaretu*, *Tukipo*, *Waipawaimate*, and *Waipawa*, which take their course through grassy plains, or gently undulating downs. *Cape Mutau a Maui*, or *Kidnapper Point*, in $39^{\circ} 42' \text{ S. lat.}, 177^{\circ} 10' \text{ E. long.}$, forms the southern head of *Hawke Bay*; from thence to *Cape Palliser* the coast is intersected by various small streams, which descend from a lofty mountain chain, running parallel with it, under the name of the *Puketoi*, and further southward of the *Maungaraki Mountains*, but the shores are very slightly indented. The land between *Kidnapper Point* and *Cape Turnagain* (*Te poro poro*), a high bluff head with yellowish cliffs, is of very unequal altitude; in some places it is lofty next the sea, with white cliffs; in others low, with sandy beaches; the country is not so well clothed with wood as about *Hawke Bay*, but resembles rather the high downs of England.

Between *Cape Palliser* and *Cape Campbell*, the north-eastern extremity of *NEW MUNSTER*, or *MIDDLE ISLAND*, lies the southern entrance of *Cook Strait*, here about forty miles wide, the northern boundary of which (formed by the coast-line of *New Ulster*) is, during eight months of the year, a lee shore, the south and south-west

* *Cook's First Voyage Round the World*, p. 127.

DIV. VI.

‡ There are various rivers of this name in New Zealand, *Wai* signifying water, and *roa* many.

§ *Bishop's Journal*, p. 71.

winds blowing with extreme and often sudden violence. Between Cape Palliser and *Cape Terawite*, the point at which New Ulster most nearly approaches New Munster, the Strait being here only seventeen miles wide, are two inlets, separated by a mountainous, fern-clad neck of land, terminating in a promontory called *Baring Head*, or *Cape Riwa-riwa*. The most easterly of these is *Palliser Bay*, a large open roadstead, notorious for the detention of vessels. The *Ruamahunga* takes its rise in the *Rimutaka Mountains*, from whence it receives several tributaries, flows through the *Wairarapa Valley* into the *Wairarapa Lake*, and communicates at some seasons with *Palliser Bay* by means of another smaller lake, the entrance to which is occasionally quite impracticable, and always very shallow.

The lakes cover an area of 50,000 acres. A late writer states that—

"The river *Ruamahunga* is itself navigable, the channel being sufficiently deep for vessels of forty or fifty tons, whilst whale boats can ascend the river for twenty or thirty miles above the lake. As the colony advances these lakes will no doubt be formed into inland harbours. The improvement of the navigation of the bar presents no insuperable difficulty, and from the great rise of the floods in the river (sixteen feet), it will be easy to direct the surplus water so as to form an available passage for larger vessels."*

About a mile from *Baring Head* is a bold cliff called *Pencarrow Head*; the curve between the two forms *Fitz-Roy Bay*, where small vessels sometimes ride out north-westerly gales.† Immediately to the westward is the entrance to *Port Nicholson*, through a channel about three miles in length, and varying from a mile to a mile and-a-half in width, with high precipitous hills on either hand, and deep water everywhere; except on one reef of sharp pyramidal rocks which runs some distance into the channel, leaving,

* *Handbook for New Zealand*, by a late magistrate of the colony. 1848.

† *Cook's Strait Almanack*.

‡ Angus expatiates, with the delight of an artist, on the varied beauties of *Port Nicholson*, describing it as resembling, "on a sunny day, a large blue lake embosomed deep in hills and rocky precipices, the islands in its centre glistening in the sunshine," while to the northward the valley of the *Hutt* stretches up towards the snowy range of *Tararua*, whose white peaks stand out against the azure sky, a beach of fine white sand meeting the water's edge. —(Vol. I. p. 234.) The picture of the harbour on a windy day is the far less pleasing counterpart of the above. The same writer describes the wind rushing in as through a funnel with unrelenting fury. "These 'south-easters,' as they are termed, generally continue two or three days, the storm being at its height

however, abundant room for a ship to work in. The inlet then expands to the westward, forming a basin, landlocked in nearly every part, of about five miles in diameter, with soundings varying from fourteen to three fathoms; two arms extend from it, on the south-westerly of which is situated the town of *Wellington*. The best harbour for ships is opposite to the embouchure of the *Hutt River*, which takes its rise in the *Tararua Mountains*, and flows through a fertile but limited valley; another stream, having the same origin, enters *Cook Strait*, after a rather longer course, at *Pencarrow Head*. The *Hutt* may be entered by large boats during flood tide, and ascended for a few miles.

The boundary hills, both to the east and west of *Port Nicholson*, rise abruptly from the water's edge; but in that part of the curved peninsula forming its south-western shores, in which *Wellington* is situated, there is a strip of flat land at their base, about one-third of a mile broad, consisting of a soil composed of sand, shells, shingle, and vegetable earth, extending to the western headland of the harbour, where the hills are low and undulating. At the town of *Wellington* there is consequently a long extent of water frontage, with deep water at a few yards from the shore. *Port Nicholson* is unquestionably a spacious and beautiful harbour, but it has the great disadvantage of being, from its position, insufficiently protected from the heavy gales frequent in the Strait, by which vessels are delayed for days together, before they can make or leave the port. The prevailing winds (according to *Dieffenbach*) are north-west 200 days in the year, and during the remaining days south and south-east.‡

The extreme barrenness of the land near the coast, between and about *Capes Terawite* on the second day. During a very severe gale of this kind, we were unable to hold communication with the vessel for three days, and in many of the houses no lights could be burned. So great was the violence of the wind that it was impossible to stand out of doors, and the wooden houses rocked in such a manner at night that many were afraid they should be blown out of their beds. Not long since a sudden gust of wind, during one of these gales, actually raised a large boat that was on the beach, and carried it along for a considerable distance, a woman being killed on the spot where it fell. The vessels in the anchorage were rolling about tremendously; several dragged their anchors; boats were swamped and driven ashore; and the squalls swept down the hills with an impetuosity that almost stove in the houses."—(Vol. i., pp. 242, 243.)

and Palliser, was attributed by Cook to its exposure to the cold southerly winds.

The whole extent from Cape Terawite to *Cape Egmont*, in $39^{\circ} 20'$ S. lat., $173^{\circ} 40'$ E. long., where the northern shores of Cook Strait terminate, is remarkably deficient in shelter for ships. It is, however, intersected by rivers, whose number is so great as to constitute a feature peculiar to New Zealand; all are barred at the mouth, but several admit small craft at full tide, and are navigable for some distance, affording facilities for internal communication, which the mountainous nature of the country, its dense woods, almost impenetrable jungle, and extensive swamps, render extremely valuable. The course of these rivers is short, rising, as they do, not far from the sea-coast; and, from their flowing between hills, which give them many tributaries, the violent rains often swell them suddenly, and the streamlet becomes a mountain torrent, inundating the low alluvial land forming its banks, and carrying with it the stems of large trees, especially pines, which either remain fixed in its bed, or are buried near the sea-coast, when driven back and left dry by the tide.* *Porirua Harbour*, a small land-locked haven ten miles to the northward of Port Nicholson, communicates with an inlet, which here opens in the rock-bound coast, by means of a gut about 100 yards in breadth, through which the tide, at its ebb and flow, rushes with great violence. On the bar, there are about fifteen feet at high-water spring tides, the fall of tide varying from six to seven feet.†

A tolerably good roadstead, with four fathoms water, extends between Porirua and the north end of *Mana*, or *Table Island*, an island about two miles long, by half-a-mile broad, affording pasturage for sheep and cattle, where a sheep station was established as early as 1838.‡ *Kapiti*, or *Entry Isle*, lies fifteen miles to the northward of Mana, is about twenty-five miles in circumference, of an oval shape, and consists of a ridge of steep forest-clad hills, which descend abruptly to the water's edge, forming a rocky and almost inaccessible shore, throughout the greater part of its extent. One high peak rises nearly in the centre of the island,

and is visible at a considerable distance. The surface of the southern extremity of *Kapiti* is less rugged, and here the natives have their plantations; off it lie three rocky islets, which afford anchorage for a limited number of ships, and were formerly much frequented by whalers, as likewise the north-eastern end of the chief island, where a whaling station has been long established. About four miles from Mana on the mainland, is the native settlement of *Waikanae*, situated at the mouth of a stream of the same name, originating in the Tararua mountains, which here take a more easterly direction, leaving a wider belt of light, open, and level, or gently undulating land, between them and the broad sand beach, backed by sand hills, which extends as far north as the mouth of the Wanganui river, in $39^{\circ} 57'$ S. lat.

The mouth of the *Manawatu*, the largest river which disembogues in Cook Strait, is situated twenty-five miles to the northward of *Kapiti*. The tide rises eight feet. Its breadth at the mouth is about 300 yards at half tide; its depth over the bar only seven feet at low water, but inside the bar the channel deepens sufficiently to admit small vessels for about fifty miles. The *Manawatu* rises on the side of the most elevated inland group of mountains, flows beside their base, and then forming a cataract, dashes through a gorge between high cliffs, clothed with wood from their summit to the water's edge, which divides the *Rua Hine* from the Tararua mountains. It receives several tributaries on either bank during its course, which is so tortuous, that in some places, after making a sweep of several miles, it returns within a quarter of a mile of the same spot, and in this manner forms paddocks of very fertile land, often clear, but in parts rich in many kinds of timber.§ About six miles from the *Manawatu*, the *Rangitiki*, a smaller stream, descends from the *Rua Hine* mountains and enters the strait. The *Turukino*, which has its source in the same range, terminates seventeen miles further to the north-west; it is fordable at low water, but full of quicksands, as is also the *Wangaihu*, a stream which originates in the south-east side of the *Ruapehu Mountain*, and, after watering a atua, or 'evil spirit,' who was in the form of a large totara-tree, and wormed himself along like an eel, on his way from the east coast to Cook's Strait. * * * One point on the banks of the *Manawatu*, thirty-six miles by the windings of the river, is only eight in a straight line from the sea.—*Handbook for New Zealand*; by a late magistrate of the colony, p. 118.

* *Travels in New Zealand*, by Dr. Dieffenbach, vol. i., p. 125.

† Cook's *First Voyage Round the World*, p. 483.

‡ *Handbook for New Zealand*; by a late magistrate of the colony, p. 128.

§ Dieffenbach, vol. i., p. 126.—"The natives have a legend that it [the *Manawatu*] was formed by an

considerable tract of country, disembogues three miles to the north of the Turakino.

Nine miles beyond the Wangaihu is the mouth of the *Wanganui River*, an opening half a mile wide, with a dangerous shifting bar, over which the sea breaks at low water. Inside the bar the channel deepens, and is about three hundred yards wide, the low sandy banks being covered with drift-wood and pumice-stone, which the river brings down from its source in the *Tongariro Mountain*, whence it flows through a bed of about 200 miles in length, in the course of which it is swollen by several considerable tributaries, and passing through a great extent of mountainous country, is subject to considerable freshets, which, however, do not rise above its present banks. The little settlement of *Petre*, or *Wanganui*, is situated four miles up the river, which is navigable for small craft about fifteen miles further: at that distance from the coast numerous falls and rapids obstruct the navigation; but the natives, whose paha and cultivations occupy the available land on either side of the Wanganui, pole their canoes (some of which carry a cargo of a ton weight) with singular dexterity, almost to the head waters at the foot of Tongariro.

The scenery of the upper part of the river is exceedingly grand and imposing; about thirty miles from its embouche the hills close in, and the channel winds between ridges, eight hundred or a thousand feet in height, clothed with every variety of forest timber and fern, the slopes being occupied by native settlements: in other parts it is overhung by trees, growing on the summit of the precipitous cliffs, fringed with graceful ferns and mosses down to the water's edge, by which it is hemmed in.*

The coast from Wanganui to Cape Egmont presents a cliff of moderate height, on the top of which the land is flat, rising with a very gentle ascent towards the latter point. The intervening streams worth notice are the *Waitotara*, whose valley is described as resembling, on a much smaller scale, that of the Wanganui, from which it is about twenty miles distant, and the *Patea*, a river originating at the foot of *Taranaki*, or *Mount Egmont*, and flowing through the south-western portion of the fertile tract of open country known as the Taranaki District, in the centre of which the noble emi-

nence itself, rises, from a generally level country, to the height of 8,840 feet, by a gradual ascent from a circle about thirty miles in diameter, which forms the outer circumference of its base. About half this circumference, viz., from the *Waimate*, (a small stream, whose embouche lies about twenty miles to the north-eastward of the Patea,) to *Sugar-loaf Point*, in $38^{\circ} 55' N.$ lat., $174^{\circ} 1' E.$ long., is bounded by the sea coast; Cape Egmont being the most western point of this circle, half of whose area is considered to be sufficiently level for cultivation.† Three branches, or buttresses, diverge from Taranaki, but, from their inferior height, the lofty cone itself appears almost wholly isolated; one of these stretches nearly to Cape Egmont; another extends inland, in the direction of the still active volcano of Tongariro; while the third runs in a parallel direction with the coast, separating an undulating belt of available land, in which the settlement of New Plymouth is situated, from the broken country watered by the western tributaries of the Wanganui river. A countless number of streams flow into the sea from Mount Egmont, or from several small lagoons between it and the coast.

Sugarloaf Point is a dome-like cone, of trachitic porphyry, which rises about 300 feet, in an isolated position, with one side of its base washed by the sea. In its neighbourhood large boulders of volcanic rock are cemented together into a solid conglomerate, which seems to extend like a stream of lava from Mount Egmont into the sea, but cannot be traced far inland. The *Sugar-loaf Islands* are five in number, the largest of them is extremely steep, about one mile in circumference, and 500 feet high; the vegetation is confined to flax, and a few other plants, which grow in the interstices of the rock. *Moturoa*, the northernmost, is joined to the main by an isthmus, dry at low water of spring tides.

The *Roadstead of New Plymouth*, situated immediately opposite the town, is sheltered by these islets from south-west winds, but is exposed to the west and north-west winds, which frequently blow with extreme violence, rendering the anchorage precarious, and causing a heavy surf upon the beach. The holding ground also is bad, the bottom for the most part being sand over rocks.‡

* Dieffenbach, vol. i., p. 121. Power, pp. 108, 150. *Adventure in New Zealand*, by E. J. Wakefield, vol. i., p. 262; vol. ii., p. 89.

† *Handbook for New Zealand*; by a late magistrate, p. 273.

‡ Mr. Hursthouse comments upon the erroneous

One circumstance, however, in favour of the roadstead is that the appearance of the weather invariably gives a warning of sufficient length, to enable ships to get under weigh and make an offing.* The *Huatoki*, *Waiwakaiho*, *Waiongona*, and *Waitera*, flow into it from the hilly ridge already mentioned. The last and longest of these streams enters the sea twelve miles to the north-eastward of the Sugarloaf Islands, and has a bar at its mouth nearly dry at low water, with a rise of twelve feet in the spring tides; inside the bar the river is navigable for boats for about three miles. From this point the sea shore becomes elevated, rising in cliffs, which at the mouth of the *Urinui River* are about 100 feet high; the lowest formation consists of marly clay, above which, twenty feet from the beach, is a formation of wood, very little altered or carbonized, and ten feet in thickness, but irregular, surmounted by a loamy soil. A little farther on the scenery becomes very picturesque, the constant action of the waves having formed the soft yellow sandstone into fantastic shapes, resembling walls and castellated turrets, surrounded by balconies, the effect being greatly increased by the profuse vegetation of fern, alternating with forest, which continues to the water's edge. This formation extends to the bar harbour, practicable at certain seasons for small craft, formed by the mouth of the *Mokau*, a river which flows from a range of hills called *Rangitoto*, lying west of Lake Taupo, through a fertile, but mountainous and densely-wooded country.†

Another river, named the *Marokopa*, originating in the same ridge, discharges itself into the sea, between the embouche of the *Mokau* and *Kawia Harbour*, an inlet of which Dr. Dieffenbach gives the following account:—

"The harbour has a clear entrance about a mile

opinions that the wreck of the third vessel despatched to New Plymouth, and the danger incurred by the emigrant ship *Oriental* have given rise to concerning the character of the roadstead; he states that of 259 vessels which had visited it at all seasons of the year, but one ship and fourteen anchors had been lost; and some of these accidents were such as, after seven years' experience, would hardly occur again.—*Account of the Settlement of New Plymouth*, by Charles Hursthouse, Jun., 1849; pp. 79, 85.

* The country comprised in the Taranaki settlement will be more particularly described elsewhere.

† In the early part of its course, near the native village of *Wakatumu*, the *Mokau* dashes down a perpendicular wall of rock, from a height of about sixty feet, in one broad sheet of water. The rocky steep

and a quarter broad, with two fathoms at dead low water spring-tides. The tide rises twelve feet. The best anchorage is along the northern shore, where the depth varies from five to eight fathoms. The harbour forms an irregular basin, and is joined by two rivers [the *Wahi-haru-keke* and the *Awaroa*] which descend from the hill range and admit boats."‡

A mission station is prettily situated at the south-eastern extremity of the harbour: *Kawia* is separated by a small promontory, skirted with fine pokutukaua trees from *Aotia Harbour*, a long, shallow estuary, with a bar at its mouth, which at high tide presents a noble expanse of water, but at other times is little more than a succession of mud flats.

Proceeding northward along the coast, the next remarkable feature is *Woody Head*, the name given to a rocky group of hills, 900 feet high, which form the southern head of *Wangaroa Harbour*,§ whose northern shores are composed of limestone cliffs, from sixty to seventy feet high, corroded by the action of the water, and half-concealed by the overhanging verdure. The harbour itself is a long inlet, with a bar at the entrance; it has, however, a channel of twelve feet at low water, and admits smaller craft, which find shelter in several bays on the northern shore. The tide rises ten feet.|| The *Wai-te-Tuna*, a small stream, flowing into *Wangaroa* from the eastward, has a channel for boats; and from the point at which, on account of falls, it ceases to be navigable, an easy walk of four hours across the coast range, which slopes gently on either side, leads to the left bank of the *Waipa*, some miles above the confluence of that stream with the *Waikato*. *Waikato River* rises amid the snows and glaciers of the Ruapehu Mountain, and flows in a rapid current, by a very circuitous channel, into the southern extremity of Lake Taupo, having received several tributaries on its left bank; it issues thence a

on each side the chasm are clothed with evergreens, among which the graceful rimu pine stands pre-eminent; high broken rocks resembling castles, fortresses, and towers rise on the opposite side of the glen, and the surrounding hills are wild, and covered with fern.—Angas, vol. ii., p. 84.

‡ *Travels in New Zealand*, vol. i., p. 308.

§ This harbour must not be mistaken for that situated to the north of the Bay of Islands, described at p. 260, *Wanga*, in the Maori language signifying "many waters" and *rou* "noisy," the term *Wangaroa* is frequently applied. The reader will probably have observed that the names of most of the rivers are prefaced with *Wai*, a Maori word signifying "water."

|| Dieffenbach, vol. i., p. 305.

stately stream, about 300 yards wide, and of considerable depth, its volume having been augmented by the waters of several mountain torrents, which fall into the lake from the southward, and of which the Waikato is the common outlet. From the high level of the country round Taupo, the river takes a north-westerly direction, through the centre of the island, gradually approaching the western coast, and is interrupted by occasional falls and rapids in its descent. It is, however, navigable from its sea-mouth, which admits vessels of thirty tons, for a distance of about one hundred miles, when it is joined by the *Waipa*,* which is navigable for boats sixty miles farther.

The left shore of the Waikato consists, for about eight miles from the sea, of shifting sand; the right shore is hilly, and at the foot of the hills, near the embouchure of the river, is *Maraenui*, a station of the Church Missionary Society. There are many small islands in the channel of the river, some of them a mile in length, wooded to the water's edge, and possessing rich alluvial soils. According to Dr. Dieffenbach, the Waikato, with its steep banks, and deep, rapid stream, might advantageously be converted, throughout its course, into a canal, by which means an extensive water communication would be opened to the very heart of the island.

The *Mangakino*, the *Waipapa*, and the *Mangawio*, descend into the Waikato from a mountain range, whose precipitous and fantastic crests border the left bank of the river, when it emerges from Lake Taupo. The *Awaroa* branches off from the Waikato, about eight miles from its mouth, in a northerly direction, and extends to within a short portage of the southern arm of Manukao Harbour.

The *Waipa*, though it has a far shorter course than the Waikato, is in other respects, a more important stream. It rises in the Tongariro group, and flows through a picturesque and lightly wooded valley, bounded to the westward by the coast range, and to the eastward by the Maunga Tautari hills. This valley, which has an average breadth of thirty miles, and may be more properly called a table land, rivals in fertility the best districts in the island, pos-

sessing a volcanic soil, with much alluvium, and having the advantage of being perhaps the most sheltered region in the whole country.

From the mouth of the Waikato river, to the southern head of *Manukao Harbour*, a distance of about thirty miles, the coast runs nearly north and south, and consists of a broad and hard sandy beach, with soft sandstone cliffs, of a moderate height. Manukao Harbour is an inlet, about fifteen miles long, and eight broad. Its south head is formed by a remarkable steep hill, of white conglomerate, heaped up by north-westerly gales; its north head by black conglomerate, of a rugged shape:—

“Inside the outer head the coast presents a bold rocky precipice, alternating with small secluded bays, but a vigorous vegetation covers them to the water's edge, and kauri trees have grown in places where the precipice is inaccessible on account of its rapid declivity. About three miles from the outer headland, the coast sweeps at a right angle round a cliffy inner headland, thus forming a neck of land about three miles long and as many broad. Round this headland, close in shore, is the best anchorage in the harbour, perfectly sheltered from the north-west and south-west winds. A swell which would be liable to set in from the harbour itself is broken by a long sand bank occupying the centre of the basin. The southern shore of the harbour consists of undulating and fertile land, which extends from Onchunga towards the Waikato. There is a second channel on that side of the harbour, and a channel for boats extends towards an arm of the Waikato river, the *Awaroa*. * * * Although the harbour of Manukao has a bar at the entrance, there is a deep and free channel three quarters of a mile broad, close to the northern head. Once between the heads the channel is deep and free from danger. The tide is full two hours and three quarters later in Manukao than at Waitemata [the harbour of Auckland on the opposite coast] and rises ten feet and a half.”†

A long line of sandhills stretches from Manukao to *Kaipara Harbour*,‡ an extensive estuary, into which the tide, (rising ten feet at full and change,) rushes with great velocity. There is no bar at the entrance, but there are shoals and sand banks in the offing, which however leave a channel on either side, between them and the main land. Of these, the southern is the deepest: the soundings vary according to the season of the year; the breadth is about two miles. The harbour branches into several arms, which receive streams of fresh water: the southernmost of these, the *Kaipara*, flows

* Bishop Selwyn describes the junction of the Waikato and Waipa, as reminding him of the confluence of the Rhone with the Saone, at Lyons; the Waikato rushing in like an arrow, and answering to the Rhone—the Waipa to the quiet Saone.

† Dieffenbach, vol. i., p. 294.

‡ Captain Fitz-Roy states that the largest ship may enter or leave either Kaipara or Manukao “without unusual difficulty.”—Parliamentary Papers, 1846, p. 127.

in a moderate-sized valley, formed by the hills which bound the sea coast between Manukao and Kaipara harbours, and is separated from an inlet of the harbour of Waitemata, in Hauraki Gulf, by a low isthmus, only three miles in breadth, of which mention has been before made. The Kaipara is navigable for large boats as far as the tide runs up. It is serpentine in its course, and forms a number of paddocks of alluvial land, which a little drainage would render very valuable. The most important of the rivers of which Kaipara is the estuary is not, however, that from which it takes its name; the *Wairoa* (*long water*), which flows into the northern arm of this extensive inlet, being a far more imposing stream. This latter rises in the hills, on the northern slope of which the *Waima*, an arm of the *Hokianga*, has its source. It is described by a local writer as being navigable, for seventy miles up, for a ship of 600 tons, and as being practicable, 150 miles, for a vessel of 150 tons* (reckoning, evidently, from the entrance of the harbour.) Dieffenbach speaks of it as navigable for canoes for 138 miles, from the head of the harbour, where their further progress is prevented by rapids; he adds,

"Small vessels can go up the Wairoa eighty-five miles from the head of the harbour, where there is a depth of twelve feet; but only fifteen miles lower down, the river has water and a clear channel for vessels of any burden, and also anchorage close in shore." (Vol. i., p. 267.)

The *Otomalia* rises among the hills, near Wangari harbour, on the eastern coast, and flows into Kaipara harbour to the southward of the Wairoa. Much valuable timber is found on its banks, which like those of the other rivers terminating in the Kaipara estuary, afford sufficient available land to enable the colonist to combine agricultural pursuits with the timber trade.

A bold shore, little broken by water-courses, extends in a north-westerly direction from the North Head of Kaipara, and is backed by a mountain ridge, of which the most conspicuous feature is *Mount Manganui* a steep, bluff headland, running out into the sea, rising to a considerable height above the neighbouring country, and forming a landmark to vessels desiring to enter the intricate and barred entrance of the *Hokianga*

River in 35° 32' S. lat., 173° 27' E. long. A pilot is, however, stationed at the heads, with whose assistance vessels of 500 tons can safely enter. This estuary, on whose shores the first Wesleyan mission station was established in 1820, stretches inland, and is navigable thirty miles from its mouth, which may be distinguished by a succession of sand hills on the northern shore, and by the shrubby vegetation and dark rocks, which characterise the southern head. The bar lies nearly two miles out at sea, and should not be taken with the ebb of the tide, which rises from ten to fourteen feet.

The banks of the *Hokianga* are steep, and heavily timbered. The cultivable tracts in its vicinity are small, dispersed among hills, and intersected by innumerable creeks and mangrove swamps. Among the streams which flow from every direction into the *Hokianga* estuary, are the *Mangamuka*, which rises near Mount Maunga-taniwa, and has a course of about twenty miles, for the last half of which it is navigable for vessels of moderate burthen;—the *Waiho*, and the *Wir-inake*.

About fifteen miles to the northward of the mouth of the *Hokianga*, is the embouchure of *Wangape River*, sometimes called *False Hokianga*, from the resemblance between its abrupt shores covered with dark vegetation, and those of the neighbouring harbour. The entrance is somewhat narrow, and there is a small rock near the north head: the soundings at the entrance are said to be three fathoms, and the channel leading to the native village of *Rotokakahi* has four fathoms.† The remaining portion of the western coast of New Ulster is extremely bleak and forbidding. The long, narrow, sandy peninsula which forms the northern extremity of the island terminates to the westward in the low rocky promontory, first sighted by Tasman, in 1643, and named by him Cape Maria Van Diemen, off which at a distance of about twenty miles, lie the *Three Kings*, a cluster of conical islets. From Cape Maria the coast line takes an easterly direction, and is occupied by sand-hills for about four miles, when it again rises in a towering and precipitous cliff of conglomerate rock, unapproachable from the seaward, which extends for about six miles, and against which the ocean dashes with extreme violence. To

* *Remarks on New Zealand*. By Walter Brodie. 1845.

† Polack describes Wangape as a large bay about six miles wide from north to south but no such bay

is laid down either by Arrowsmith or any other hydrographer.—*Travels and Adventures in New Zealand, between the years 1831 and 1837*, by J. S. Polack, Esq., pp. 267, 268.

this dreary locality, whose gloomy desolation is rendered yet more striking by the shrieks of innumerable wild fowl, the New Zealanders have given the name of the *Reinga* or *Flight*, and they hold it sacred, supposing that the soul newly freed from its mortal coil, here takes its leave of this material world and enters the precincts of the *Reinga* or world of spirits, descending down the face of the cliff. A curve called *Sandy Bay*, which however affords no anchorage, succeeds the rock-bound shore, and from thence to North Cape, at which point our running survey of the coast line commenced, a barren and inhospitable country continues, consisting of banks of white sand. Cook describing the aspect of this vicinity, says—

"In about latitude 35° 45' is some high land adjoining to the sea; to the southward of which the shore, is also high, and has the most desolate and inhospitable appearance that can be imagined. Nothing is to be seen but hills of sand, on which there is scarcely a blade of verdure; and a vast sea, impelled by the westerly winds, breaking upon it in a dreadful surf, renders it not only forlorn, but frightful; complicating the idea of danger with desolation, and impressing the mind at once with a sense of misery and death."—*First Voyage Round the World*, p. 161.

MOUNTAINS.—Dr. Dieffenbach, after examining a large portion of the interior of New Ulster, arrived at the conclusion that there was "no regular system of a mountain range running through the island." There are, however, many ridges more or less connected with one another, and almost invariably assuming a north and south direction. Several of these, although devoid of the strongly marked and rugged outline which distinguishes chains of granitic or primitive formation, yet afford much picturesque and varied scenery; huge glaciers and plains of snow characterize the loftiest summits, whence impetuous torrents pour down, forming numerous cataracts in their rapid descent, and nourishing the dense vegetation of stately trees or luxuriant fern, which grows in many places even to the verge of perpetual snow, and entirely covers the winding hills of inferior height, that skirt the base of the loftiest eminences. The coast line, as we have already seen, is generally backed by a chain of high land, varying in altitude and in distance from the shore. Of the interior ranges the most striking is that called the *Rua Hine*, which is connected to the southward with the *Tararua* and *Remutaka* mountains, and to the northward with the magnificent group formed by the *Ruapehu*, *Tongariro*, and two or three lesser peaks,

near the centre of the island. The *Ruapehu*, an extinct volcano, reaches far above the limits of perpetual snow. Its height is estimated at 9,000 feet. A narrow valley intervenes between it and *Tongariro*, a volcano in active operation, from the summit of whose truncated cone white vapours rise from time to time, while dense smoke issues from several crevices in the steep hills on which it stands. During several months of the year, snow extends for a considerable distance down the sides of *Tongariro* peak (whose altitude above the sea is about 6,200 feet), and likewise crowns the inferior eminences clustered around; near its termination are boiling springs, which send up volumes of steam: forests clothe the lower declivities for some miles, the ascent commencing in fern hills. *Taranaki* or *Mount Egmont*, an extinct volcano situated in the south-western extremity of the island, has been already mentioned, and will be again referred to in the section on geology. The height of *Mount Edgecumbe*, a lofty peak sheltering the shore of Highland Bay in the Bay of Plenty, has not been ascertained, but it is supposed to be about 7,000 feet.

RIVERS AND LAKES.—The principal rivers in New Ulster, have been described with the portion of the coast line in which their outlet is situated, all of any importance join the sea, but several small streams flow into *Lake Taupo*, the largest of a chain of lakes which occupy the centre of the island, and are most of them intimately connected with the eruptive character of the country. *Lake Taupo* lies twelve miles north of *Tongariro*; its waters are supposed to be at present 1,337 feet above the level of the sea, but various appearances indicate, that it had formerly a much higher level. It is of an irregular triangular shape; its greatest length is about thirty-six miles, and its greatest breadth about twenty-five; its borders are in many places deeply indented. The western shore recedes, forming a deep hollow bay called *Karangahape*, at either extremity of which, precipitous cliffs rise to the height of many hundred feet, the adjacent country presenting a series of abrupt peaks, and seeming "like a sea of lava cooled while in a state of violent agitation."* The eastern and southern shores, consist of high pumice-stone cliffs, which are continually undermined, broken down, and carried away by the current of the *Waikato*, which enters

* *Church in the Colonies*. New Zealand. Part ii., p. 39.

the southern extremity of Lake Taupo by a sluggish shallow mouth, but issues from it, at a spot marked by an isolated eminence called Tauhara, a deep and rapid stream. A small but delicious kind of fish abounds in the lake, and in fine weather many canoes are out fishing, but the natives are afraid of trusting themselves on its broad expanse, whenever there is the slightest indication of strong winds, for the lake being on most sides surrounded by lofty and almost perpendicular cliffs divided by gullies, its waves are frequently very high, and squalls are both sudden and dangerous.

Lake Roto-a-ro, the chief source of the Upper Waikato, is situated immediately under the north side of Tongariro, whose snowy and rugged top, contrasts very strikingly with the soft woodland scenery interspersed with numerous and extensive patches of native cultivation, which adorn the opposite shore. This lake is about three miles in length; its level above the sea is 1,709 feet, that of *Roto-Pounamu* a much smaller sheet of water, a mile and a half distant, is 438 feet higher. *Roto-Pounamu* is hemmed in on all sides by precipitous, basaltic rocks, and the surrounding mountains are clothed with almost impenetrable under-wood. It is about a mile and a half in circumference, apparently of great depth, and has no visible outlet. *Roto-Kawa* or *Bitter Lake*, so called from its waters being strongly impregnated with alum, lies on the north-eastern slope of Tauhara Mountain, and is three miles in circumference.* *Roto-rua Lake* is situated about thirty-five miles to the north-eastward of Taupo. It is twenty-five miles in circumference, and nearly circular. The hills which surround it are low, and generally covered with fern, but to the westward a wooded range rises to the height of about 800 feet. The peculiar feature connected with *Roto-rua Lake* is the number of hot springs which at several places rise close to its banks. Of these a most interesting description is given by the Bishop of New Zealand, who, alluding to a spot about three miles from the native village of *Ohinemutu*, which he examined in 1843, says,

"Here [at *Wakarewarewa*] are to be seen all varieties of *Ngawha* (hot springs). There are mud cauldrons, black, blue, grey, green, yellow, and red, the very emblem of laziness; a faint stream rises from them, and ever and anon a solitary bubble of gas disengages itself slowly from the surface, which then returns

* Dieffenbach, vol. i., p. 376.

† *Church in the Colonies*. New Zealand. Part ii., pp. 31, 32.

to its usual dulness. Close by the side of these, and in strong contrast, are the clear pools of boiling water, of great depth, and of bright azure, enclosed in precipitous walls of sulphurous formation; from some of these hot streams flow down, which are guided by the natives either into artificial baths, or into natural hollows of the rocks; the supply of hot water being so regulated as to keep the bath at the right temperature. Among these cauldrons and pools, a strong and rapid stream of cold water rushes down, in some places not a yard from the spot at which the natives are sitting up to their breasts in hot water, shelling *Tawa* berries, or peeling potatoes, or, failing these employments, enjoying their never failing resource of smoking. But by far the most beautiful springs are the boiling jets, which are thrown up to the height of many feet from a narrow orifice in the top of an irregular cone, formed of the matter held in solution by the water, which is deposited as it cools, and forms a substance of a pinkish-white colour, sometimes also tinged with yellow by crystals of sulphur. It is perfectly safe to stand upon the tops of these cones, to the windward of the spout, and from that position it is grand, first, to hear the roaring and boiling of the cauldron, and then to see the jet spring up into the air, shivered by the force of its projection into silvery foam, and accompanied by a volume of white steam. The hot water, in its descent, trickles down the sides of the crater, and falls into several natural baths of most agreeable temperature, formed in the pure and white substance of the cone, and lined with the same matter in its half formed state, still yielding and elastic. Here the traveller may lie at his ease, and watch the bursting of the boiling fountain above him: but if the wind should happen to change, he must shift his position, or his place will soon be too hot for him. A small native village is here, with the usual appurtenances of a native steam kitchen at the hot-springs; namely, hot plates, made of large slabs of stone, laid over boiling water to dry the *Tawa* berry upon; steam hangings, or native ovens, always in readiness, and holes of boiling water in which fish and potatoes can be speedily cooked. A native swing completes the equipment of this fashionable watering-place, which, together with the game of draughts, relieve the ennui of those who resort to the baths."†

In the centre of the lake is an island named *Mokoia*, about a mile in length, on which there is a native village, surrounded by boiling springs. *Roto-rua* discharges its waters, by a deep stream about a quarter of a mile long, into another lake named *Roto-iti* (small lake), of a very irregular shape, and bordered by fern-clad hills.

Tara-wera, which Dr. Selwyn calls "the gem of the lake scenery of New Zealand," is situated a few miles to the south-eastward of *Roto-rua*, and is about three miles in length. The southern shore is marked by a lofty mountain, with a broad serrated top, looking like the frustrum of a large cone, from which the point had been violently torn off, leaving a jagged outline.‡

‡ *Annals of the Diocese of New Zealand*, p. 85. Published in 1847, by the Society for Promoting Christian Knowledge.

The principal pah is strongly fenced on all sides, and picturesquely situated on a fertile neck of land, a mile in breadth, which separates Tara-wera from another lake named *Kareka*, of about six miles in circumference, with hilly or rocky shores, generally wooded. Dieffenbach records a circumstance with regard to Lake Tara-wera, which seems to throw some light on the subject of the peculiar configuration of this portion of New Ulster:—

“The rocky shores are lined with pohutukaua-trees, other vegetation also overhangs the cliffs and peep out of the fissures of the rock. I was somewhat surprised to find the pohutukaua-tree (*Metrosideros tomentosa*) on this inland lake, as it is a tree which I never found but on the sea-shore. This may perhaps be regarded as another confirmation of the theory, that the lakes which run in a continued chain from Taupo to the eastern coast are the remains of a former arm of the sea, and have been shut from it by an uplifting of the land.” (Vol. i., p. 384.)

Tara-wera is connected with two small lakes, by a rapid, but narrow and serpentine stream, whose waters are of a temperature of 85 degrees, and from whose banks issue numerous hot springs. The larger of these, *Roto-Mahana*, or *Warm-lake*, is not more than one mile in circumference. Its distinguishing feature is a singularly beautiful cascade, formed by the descent of the waters of a boiling pond, down a flight of broad steps, “the colour of white marble with a rosy tint,” into the clear, blue lake, which is itself encircled by verdant hills, and adorned by several islets, some of bare rock, others covered with shrubs, the freshness of whose green foliage, would seem rather heightened than impaired, by the clouds of steam issuing from a hundred openings, around and among them. The steps, which are firm, like porcelain, about fifty in number, and from one to two feet broad, are the result of the siliceous deposits of the waters of the pond. The concretions assume interesting forms of mamillary stalagmites, of the colour of milk-white chalcedony, nor are there wanting stalactites of various sizes to enhance the romantic, and almost magical effect of the scene which greets the eye of the traveller, on attaining the crest of the surrounding hills. A species of water-fowl, called *porphyrio* or *pukeko*, ducks and snipes, frequent the lake in great numbers, as also gulls, which feed upon a small fish that abounds there.—Dieffenbach, pp. 381—383.

* A large number of kauri trees may be seen lying at the bottom of the lake.

The *Wairarapa Lakes* have been described (see p. 266), the only remaining one in New Ulster which needs mention, is that of *Mapere*, or *Omapere*, a sheet of water about one square mile and a half in extent, situated in the northern extremity of the island, near Waimate. Mapere is apparently of no great depth,* nearly circular in form, surrounded by wooded and sloping hills, and bordered, at some parts of its circumference, by extensive tracts of level and fertile land. Occasionally, the shores are steep, and consist of basaltic lava, a fact which seems to indicate that the lake was formerly the site of a crater; and this supposition is confirmed by a tradition extant among the natives, that a large village, with its inhabitants, was here suddenly engulfed during an earthquake.

AUCKLAND AND THE NORTHERN PENINSULA.—Having endeavoured to convey to the reader an idea of the coast line, mountains, and rivers of the Northern Island, it remains to shew the leading topographical features of the several districts into which it is naturally, or politically divided. Unfortunately these divisions are as yet very imperfectly defined; the first and most obvious comprises the long Northern Peninsula, which extends in a north-west and south-east direction for about 200 miles, with a breadth varying from five to fifty miles, and is bounded on the south, by a narrow isthmus separating the waters of Waitemata Harbour, from those of Manukao,† on the opposite or western coast. On this isthmus, and on the southern shore of Waitemata Harbour, is situated AUCKLAND, the principal seat of government in New Zealand. Its position, as the capital of a maritime and commercial colony, with ready access from either coast, is of manifest importance; besides which it possesses the advantage of (comparatively) easy communication with the inland districts, both to the northward and southward, and has a considerable extent of cultivable land in its immediate vicinity, with varied soils, and a climate favourable to agricultural pursuits. In consequence of the dispersion of the European immigrants over various scattered settlements, several hundred miles apart, founded one after another with the most complete disregard of the welfare of the settlers, Auckland has not advanced as rapidly as the capitals of other British colonies in the southern hemi-

† For description of these harbours, *vide* description of coast line, pp. 262 and 270.

sphere, where the formation of new townships has been necessarily preceded by a certain amount of concentration and progress in those already established.

The site of the city is an undulating, open space of fern land fronting the sea beach, two or three miles distant from the heads of the Waitemata Channel, and stretches along two small curves called *Official* and *Mechanics' Bays*, divided by a low ridge, whose summit affords much varied scenery, while its slopes offer numerous pleasant spots for suburban residences. Official Bay contains the dwellings of many of the better class of inhabitants, such as government officers and merchants; and situated as these houses are in luxuriant gardens ornamenting the steep sides of the descent to the water, they present a charming appearance. In Mechanics' Bay the houses are of an inferior description, and are occupied by shipwrights, fishermen, and labourers. Many native canoes enter this bay on their arrival from the Thames and Coromandel Harbour, and the landing from them is often an animated and cheerful scene.*

St. Paul's Church, a brick building in the early English style, with a tower and spire, is one of the first objects which meets the eye on entering the port. Although only opened for divine service in May, 1843, and erected at a cost of £4,000, some portions of the walls have been already much damaged by the weather, in consequence of the unsoundness of the bricks of which it was constructed. At some distance from it, adjoining the house of Chief Justice Martin, stands the *Chapel of St. Stephen*, which having been built of unsound stone, is now dismantled, and enjoys the unenviable distinction of being the first European ruin in New Zealand. The churchyard is consecrated, and is still used as a private burial ground.†

The Wesleyans have erected a very neat place of worship, the Roman Catholics have also a chapel, and in and around a picturesque glen outside the city are situated cemeteries appropriated respectively to members of the Church of England, Presbyterians, Dissenting congregations, members of the Church of Rome, and Jews. The range already described as separating the two bays on which the city is chiefly laid out, terminates in a cliff, perpendicular on two sides towards

the sea, on the top of which are the barracks, built of scorise, and surrounded by a lofty stone wall. The old *Government House*—a long wooden building with gable-roofs, and trellises covered with clematis and a variety of beautiful flowers—stood on a spacious lawn, overlooking the picturesque islands of Hauraki Gulf: it was burnt down about two years ago, and has not yet been rebuilt.

Among the buildings and associations of Auckland may be noticed a Bank, Mechanics' Institute, a Museum, Lecture-room, and Library, an Agricultural Society—which issues useful reports on the best modes of cultivating various soils, and the products for which they are particularly adapted,—a Total Abstinence Society, and Masonic and Odd Fellows' Lodges.

Besides the public structures there are good private houses, and the shops in *Shortland Crescent*, which is situated on the slope of a hill leading to St. Paul's Church, are very creditable to the colony. Queen-street is wide and airy, but the thoroughfares generally are narrow and crowded. The roads are made of scorise, an excellent building material—especially adapted for their construction—which is found in great abundance in the vicinity of the numerous extinct volcanoes scattered over the gently undulating and very fertile table land that extends between Waitemata and the harbour of Manukao. These flat-topped craters vary in height from 100 to 300 or 400 feet, and have a very singular appearance when viewed from the anchorage, rising abruptly one above another in the back ground of the city. The most prominent of them, *Maungawao* or *Mount Eden* has an elevation of 500 feet, with a funnel-shaped and remarkably perfect crater, the interior of which is about 150 feet deep, and is overgrown with short fern. The outer surface of the cone has the peculiarly terraced appearance which characterizes all those in its vicinity, and evidences the flowing of the masses of ejected lava in one direction; the base is strewn with blocks of scorise, while the surrounding soil consists of the richest black vegetable mould.‡

St. John's College was originally established at the Waimate near the Bay of Islands, but in 1844 it was removed to its present position on the banks of the Tamaki

* *Savage Life and Scenes*, by G. F. Angas, vol. i. p. 288.

† *Journal of Bishop Selwyn*, part v., pp. 4 and 5.

‡ *Angas*, vol. i., p. 284. Dieffenbach notes the

similarity of these craters with those of the Ameerque, which, however, they surpass in the preservation and regularity of their funnel-shaped cones.—Vol. i. p. 290.

inlet, four miles from Auckland. This excellent and truly christian institution is designed by bishop Selwyn to answer three important ends, namely, to afford, first,—a place of religious and useful education for all classes of the community, and especially to candidates for holy orders; secondly,—a temporary hostelry for young settlers on their first arrival in the country; and thirdly,—a refuge for the sick, the aged, and the poor. The college estate, comprising 850 acres, stretches from the sea to the Auckland road in a north and south line, and to the eastward as far as the waters of the Tamaki. The plan of the college itself, in accordance with the various purposes which it is intended to fulfil, is on a large and comprehensive scale; but the failure of contractors, the distressed state of the colony, and more recently the high price of masonic and other labour caused by the works in progress in the Royal Engineers' department, and at the pensioners' villages, have prevented the completion of the structure. At present a large stone building with sixteen rooms accommodates the bishop, the English school and master, contains the diocesan library, and furnishes quarters for the reception of visitors.

Another substantial edifice serves for refectory, common hall, and kitchen; the remaining buildings are of a temporary character, among them is a commodious hospital built of wood with a stone foundation; adjoining it is a neat chapel, also of wood on a stone basement, with a burial ground annexed. Beyond the chapel and burial ground is the collegiate Maori school, contiguous thereto is the parochial day school: the college printing-office is near the main structure. Apart from all these is the secular portion of the establishment, comprising a barn, dairy, carpenter's shop, stable, and rickyard, &c., with the various appurtenances belonging to a thriving farming establishment, which is carried on by the members of the institution, on whose minds the apostolic injunction, he who will not work, neither shall he eat, is most judiciously inculcated. A large part of the tillage is carried on by spade husbandry, and probably by this time the edible wants of the inmates of the establishment are supplied by their own exertions.

The college occupies a commanding position on a volcanic hill; and the estate has three distinct frontages to navigable waters on a line of beach of eight miles between

the two extremes. Following the system of English ecclesiastical polity practised in the olden time, the bishop has established seven chapelries in the neighbouring hamlets which have each their temple of worship constructed of stone or of wood, and they are under the charge of the ordained members of the collegiate body. One of these chapelries comprises *Howick*, the chief settlement of the military pensioners sent from England, which is situated about five miles from the college on the opposite bank of the Tamaki. A very few years ago the site of Howick was a "cattle run," now it is occupied by a populous township, laid out in military order, with neat cottages, gardens, and cultivated grounds; its church spire rising from a gentle eminence overlooking the beach to the northward, and the range of the fertile Tamaki valley to the south. Here in this sylvan scene, and amidst the pleasing labours of rural industry, the veterans who have spent youth and manhood in the acquisition and protection of the wide spread domains of England, have turned their swords into ploughshares, and through the benevolence of their sovereign, and the generous statesmanship of Earl Grey, have found a peaceful asylum for their old age.

Among the numerous villages, both native and European, in the neighbourhood of the capital, may be mentioned the Maori settlement of Orakai, situated on the banks of a deep and well-sheltered bay near the mouth of the Waitemata harbour, and established by a remnant of the Nga-tiwatua tribe, who cultivate the land around, and send potatoes, maize, fruits, and other vegetable supplies, and fire-wood, to Auckland, in exchange for British manufactures. By means of this traffic they have amassed considerable sums of money.

The scenery between Auckland and Orakai, a distance of six miles by land, and about two by water, is varied and pleasing; the road lies round the head of several deep bays.

Auckland district is, generally speaking, an undulating country, with table-lands and corresponding valleys; the shores of the estuaries of the Waitemata, the Manukao, and part of the Hauraki gulf, present a succession of argillaceous sandstone cliffs of different heights, with intervening bays receding inland. The country lying between these great estuaries varies in breadth from fifteen to three miles, and at the portage of the Tamaki diminishes only three-fourths of a mile, and affords over its

surface flats of considerable extent, and declivities available for agriculture, the bottoms always occupied by small streams, generally bare of wood, or covered with patches of small-sized trees, suitable for fuel or fencing, and rising in gentle elevations to the mountain ranges to the west and south, which are of a different geological formation, and are usually covered with gigantic trees.

The country between Auckland and the range of mountains west of the Piako river consists generally of level ground, with many pretty and fertile tracts, especially along the valley of the Tamaki, whose embouchure lies a few miles east of the Waitemata Heads, where many settlers have established themselves. About five miles from the mouth of the river or inlet, (as it is frequently and justly called,) on the left bank, is a creek of great depth, leading into a small and beautiful bay, close at the foot of a high volcanic mountain, named by the Maories *Mogia*, by the English *Wellington*. Here are to be seen the remains of extensive fortifications, &c.; as also at Mount Eden, and the ruins of a very large pah, with widely spread cultivable grounds around. About thirty years ago this locality was the scene of a sanguinary battle, in which 7,000 natives were slain, fought between the tribes from the north, aided by the Waikato and Nga-te-Whatua chiefs, and those of the Tamaki and Thames districts, when the people of the latter were either entirely killed, or carried into slavery.* Indeed the whole of this neighbourhood bears unmistakable evidence of having been once thickly peopled by a warlike race, in the remains of extensive entrenchments still to be seen around the natural fortifications formed by the craters; in the great stone ovens, and other significant circumstances.

The land immediately around the extinct volcanoes is covered with loose fragments of vesicular lava and scoræ, or immense masses of more compact lava, cropping out at various points, with a variety of shrubs and trees springing up among the interstices.

With regard to the capabilities of the Auckland district, it may be said, that about one-half, consisting of undulating ground, is covered with fern and various

shrubs, (chiefly the tupaki,) and possesses a soil of a rich yellow clay, mixed with sand and charred vegetable matter. One fourth presents a more level surface, and is covered with dwarf manuka, fern, and a variety of small shrubs and tufts of grass; it has a poor soil, consisting of a whitish clay, mixed with sand. The remaining fourth is generally of a varied surface, being situated near the volcanic hills, composed of a dry, red, volcanic formation to a great depth, for the most part covered with scoræ; but when this latter is only on the surface, there is a rich red loam of high fertility.

With the exception of the volcanic land, the tract of country above described is well irrigated by natural streams, and water can be procured at all times in abundance by means of wells. The banks of the fresh water creeks are covered with evergreens and tree ferns, growing on a friable clay, mixed with ferruginous sand.†

Before passing from the vicinity of the Capital we may remark upon the valuable inland streams which approach within short distances of it, and the numerous harbours, creeks, and coves which indent its shores, and promise to render it the centre of an extensive coasting trade, as colonization extends at the adjacent favourable points. Bishop Selwyn writes enthusiastically on the advantages of its position, declaring that—

"Auckland is admirably fitted for the residence of a maritime nation. Almost every settler has the sea brought conveniently to his door, or at least close to him by one or other of those long fingers of the great estuaries which almost insulate the town and its suburban district: * * * As there never was a maritime people that did not become great and powerful, in spite of the present failure of exports and other commercial difficulties, my faith is still as strong as ever that New Zealand will be a great country, and that it is our duty to strive, as God may give us strength, that it may be as good as it will be great. Look at the position of Auckland, and judge whether it may not justly be called the Corinth of the south."†

The country to the northward of the Auckland district, is of such an irregular form, so deeply indented by arms of the sea, and so diversified on the surface, that it may be necessary to give a general view of the whole, before noticing some of the more prominent places on which Europeans or Maories are located.

* Terry's *New Zealand*, p. 37.

† *Vide* First Annual Report of the Agricultural and Horticultural Society of Auckland. 1843.

† Journal of the bishop's visitation tour throughout his diocese in 1848, p. 30.

Throughout the greater part of the Peninsula, two hilly ranges, of no great altitude, pass along either shore: they are broken in their outline by several harbours, and send out transverse ridges, which encircle or support narrow table lands, and are intersected by numerous valleys and water-courses. Of these steep, fern-clad spurs, the highest extends from Wangaroa across to Hokianga; another, less elevated, commences at Cape Rakau-manga, or Cape Brett, and passes towards Mount Manganui, separating the valley of the Waima from that of the Wairoa.

The intervals between these ranges and hills are numerous and picturesque: the valley where the Kaihu joins the Wairoa, from the westward, near the extensive native settlement of Mangakahia, is nearly a perfect level, with an extent, from east to west, of about twenty-five miles, and from north to south, of eight, the whole sufficiently elevated above the bed of the Wairoa to secure it from destructive inundations. The Maories consider this one of the richest tracts in the peninsula. The valley is bounded by extensive kauri forests, and the hills are clothed with wood to their highest elevation of about 2,000 feet. Proceeding to the southward, the valley contracts, the east side presenting an extensive flat, covered with rank vegetation, while the west exhibits a gradual and heavily-timbered slope.*

The strip of land between the western range and the coast, from the Auckland district to Cape Maria Van Diemen, has a breadth in few places exceeding four or five miles, and is more or less barren throughout its whole length: that included between the eastern ridge and the shore, as far to the northward as Wangari Harbour, consists of a succession of rugged hills, covered with light fern, and broken by deep swampy hollows, in which the *phormium tenax*, or New Zealand flax, delights. This tract is destitute of timber, and in some parts of water, and presents a desolate, uninviting aspect.

The country situated between these ridges is of a more promising character, although abrupt hills, covered with high fern, or a hard clayey stratum, over sandstone—plains with a poor, thin, sandy soil,

and extensive swamps, are described as grievously encroaching upon its cultivable area.† It is watered by the numerous streams which disembogue in the large arm of the sea, named Kaipara Harbour, on whose shores several native villages are situated: European settlers have likewise located themselves here, attracted by the two-fold and rare advantage of excellent agricultural land, and an abundance of the finest timber. The tributaries of the Kaipara have more alluvial land on their borders than is usual in New Zealand: hills, of no very great height, bound, but do not generally reach them, and are often more than a mile distant; the banks are level, and consist of a somewhat clayey and fertile soil. The Wairoa continually carries down a quantity of this soil from the higher to the lower parts of the river, in consequence of which its waters have a yellowish appearance. There are several stations on this river. That of Mr. Forsyth, on the western bank, about sixty miles from the sea, is an agricultural farm: twelve miles higher up is the extensive sawing establishment of Mr. Stevenson, reputed to be one of the most enterprising settlers in New Zealand. In 1842, he launched a schooner, of eighty tons burthen, from a creek near his premises. Twenty-five miles above Mr. Stevenson's is a village, called Hobson's Town, where several European families have made considerable progress in clearing, and built some substantial houses. Fifteen miles beyond this is a Wesleyan mission station. European settlers are scattered in different localities, and have raised good crops on their cleared lands.

The banks of the Wairoa, with the exception of such portions as are of very recent formation, and of those which have been cleared, are covered with a thick forest of timber of all descriptions, but especially of the kauri pine, which is here of remarkable height and diameter, of easy access, and in great abundance.

Large quantities of this valuable tree have, however, been destroyed, and the low, steep hills between the Waiomio valley and the point at which the Wairoa first begins to be navigable for large boats, are now nearly covered with fern and manuka, with here and there the remains of the former kauri forest, half burnt and rotten. The hills alternate with swampy valleys, with occasional forests of the kahitakea

* "A brief Survey of the Northern Districts of New Zealand." Published in Simmonds' *Colonial Magazine*.—May, 1844, signed W. H. S.

† Polack. Vol. i., p. 200.

pine (*Dacrydium excelsum*). A swampy plain stretches to the eastward as far as the rugged hills of Wangari Bay; this plain Dr. Dieffenbach says, offers some fine situations for farms, and would afford excellent opportunities for forming pasturage by the cultivation of artificial grasses, as the land is rich, and the swampy parts might easily be drained. The valley of the Wangari, on the opposite and eastern coast, is far more contracted, and much shorter than that of the Wairoa; its hills, which are for the most part well timbered, generally rise abruptly from the river's edge, leaving, at intervals, limited tracts of level land. There are, however, between four and five hundred European settlers located in favourable spots.

To the northward of the Wangari, lies the early seat of colonization in New Zealand—the *Bay of Islands*. This district consists chiefly of steep hills, but the valley through which flows the Kawa-kawa (an arm of the sea stretching to the southward, and receiving a small fresh-water stream,) has a considerable extent of excellent land. The inlet, which has the aspect of a broad river, is bounded, on either side, by wooded hills, in several of whose nooks the dwellings and cultivations of the settlers and their farm-yards, stocked with fowls, geese, and ducks, have contributed to form very homely English-looking scenery; there are also numerous and extensive plantations in the hands of the aborigines.

Kororarika, or *Russell*, is situated at the commencement of the Kawa-kawa inlet, on a narrow, elongated, tongue of land stretching out into the centre of the Bay of Islands. It stands on a flat of some two or three hundred acres, surrounded by a ridge of hills, which obstruct its communication with the interior, and to a great extent neutralize the advantages offered by its great facilities for shipping. The whole town was burned to the ground by Heke and his followers, in the autumn of 1845, excepting only the two places of worship (church of England and Roman catholic), and the houses of the clergy. It is now partially rebuilt, but still wears a very dreary appearance. *Kororarika* is the head quarters of the Jesuit mission; "a conspicuous ill-planned building, which stands on a rise of a hill behind the flat occupied by the town, is the catholic chapel of Bishop Pompallier.*"

* Angas, vol. ii., p. 173. † *Ibid.* vol. i., p. 169.

Paihia, the settlement of the Church Missionary Society, was established as early as 1823, by Archdeacon Henry Williams, the first clergyman appointed to the New Zealand mission. It is situated on the opposite shore of the inlet on which Russell stands, about three miles distant, and is described as a lovely spot,—a little oasis nestled at the foot of high fern hills, comprising about a dozen neat dwellings, almost embowered in green, and surrounded by gardens in which the loquat and other fruits thrive beneath the mild climate of this sheltered locality.†

Further to the northward is Mr. Busby's estate, termed *Victoria*, near the mouth of the Waitangi river. This tract possesses several requisites for the site of a town, for which it was at one period intended, being level, and of considerable fertility, commanding the Waimate table land, and therefore the best communication with the interior, as well as with the districts lying to the northward. It has, however, no place for the anchorage of vessels, and is open to the whole force of the north-easterly winds.

The little district of Puki-tuna, in the Waitangi Valley, surrounded by clayey fern-clad hills, has all the appearance of a garden. The soil rests on a bed of decomposed lava; is traversed in various directions by streamlets, and yields a greater variety and abundance of herbaceous vegetation than is usually met with in New Zealand. Owing to the light and porous structure of the lava, there is a resonance from the footsteps similar to the noise made by walking over a wooden bridge or causeway. A fine stream, whose banks are overshadowed by lofty trees, arborescent ferns, and cabbage palms, is separated by a low ridge from an adjacent fertile plain.‡

About fifteen miles to the westward of the Bay of Islands is *Waimate*, the agricultural station of the Church Missionary Society, which was formed in 1830, with a view to render the mission independent of New South Wales for its supply of provisions. The whole work of this settlement was done by the natives, under the superintendence of the missionaries, Messrs. Clarke, Davis, and Hamlin. Upwards of 50,000 bricks were made and burnt for building chimneys; 700,000 feet of timber were felled; three weather-board houses were erected, with stalling for twelve or fourteen

† Jameson, p. 247.

horses: stores, work-shops, and ultimately a neat chapel, capable of holding 300 to 400 persons. The introduction of ploughs and harrows, all made at the Waimate, constituted an era in the history of the country. Till these implements were introduced, the Maories little knew what their land was capable of producing; as but very small portions were brought under cultivation, owing to the great difficulty of breaking it up with the hoe or the spade.* Owing to the diligent labour of the natives, the settlement presents the aspect of a thriving English village; the houses are commodious, and of a pleasing appearance, each surrounded by a verandah, with a lawn and garden plot in front. They form a row about a mile in length, and are inclosed within a strong wooden fence, tastefully interwoven with rose-bushes and creepers. The enclosed and unbuilt on ground is laid out in productive gardens and rich clover paddocks. Besides the houses occupied by the missionaries and their families, there are numerous cottages belonging to sawyers, tradesmen, and agriculturists attached to the mission, with their wives and families, and there is a large Maori village. At one end of the settlement stands the church, at the other, a water flour-mill.

The table land on which the settlement is situated, is described as having a length of about three miles, by a breadth of one, with an elevation of 500 feet above the sea. This tract is very deficient in timber, and the climate is so bleak, that it is with difficulty that the more delicate English fruits are brought to perfection.† Dieffenbach describes the soil, as a light, dusty volcanic earth.

There are several conical craters in the vicinity of the station, all of which are covered with vegetation in the interior, and appear to have long been in a state of repose. The two most remarkable are those of Pouerua and Pukenui; they are isolated, and of a truncated form.

Some miles from Waimate is a lake about one mile in circumference, whose banks are covered with efflorations of pure sulphur; at a little distance is a smaller lake, close to which are some curious thermal springs. One of these is strongly aluminous, and has a temperature of 62° Fah.; a few feet from it is a tepid spring of a milk-white

colour and alkaline taste, temperature 124° Fah.; a third is acidulous, temperature 154° Fah.; while from another rises strong sulphuretted hydrogen gas of the temperature of 133°, that of the surrounding air being 80° Fah.‡ Some of the waters are said to contain sulphur in a state of oxygenation, approximating to that of vitriol, and to stain and burn a pocket handkerchief. The springs are frequently resorted to by the Maories for the cure of cutaneous, scrofulous, and other diseases, and much benefit is obtained from bathing in the medicated waters.

The surrounding country, especially to the southward, has the arid and desolate aspect which characterizes the neighbourhood of mineral waters; the uniform brown tint of the stunted fern on the hills, is only occasionally varied by sheltered groves in the ravines. Even the argillaceous rock is altered by the gaseous emanations of sulphuric acid, parts have become white and red, while other portions have been changed into a species of clay covered with sublimations of pure alum, sulphur, and different sulphates.

The country between the Waimate and the mission station on the Keri-Keri river, a distance of seven miles, is of inferior quality, but higher up on the banks of that stream the soil improves considerably. In 1819, Mr. Butler and Mr. Kemp were established at the Keri-Keri on behalf of the Church Mission Society, on a beautiful spot situated at the confluence of the tide with the fresh water. The river is navigable to within four miles of the station by vessels of 150 tons, and by small craft to the wharfs and capacious public store erected by the missionaries. Below the settlement on the banks of this stream the basis of the soil is basaltic, and the river rolls over a bed of lava, forms no valley, and is destitute of timber; it seems as if an immense crust of basalt had been elevated nearly to the surface. The estuary, which has the appearance of a broad river, presents some fine sites for farming establishments. To the northward of Keri-Keri, as far as Wangaroa, the land is mostly hilly, covered with primitive forest; but near the coast the whole forest has been destroyed. Between Wangaroa and Tauranga there is a beautiful and fertile valley, sheltered by the coast hills from the ocean winds, and irrigated by a small river which flows in Wangaroa harbour. An extensive table-land,

* *Annals of the Diocese of New Zealand*: 1847. pp. 12, 13.

† *Brief Survey*, p. 36.

‡ Dieffenbach. Vol. i., p. 245.

varying in elevation from two to three hundred feet above the sea, lies to the south-east of the Waimate district, intersected by the Waiaruhe, one of the sources of the Waitangi, whose waters roll over a bed of lava without forming any valley, and occasionally flood the adjacent country. At the extremity is Pakaraka, the property of the sons of Archdeacon Henry Williams, where there is a considerable extent of land under cultivation.

The vicinity of Hokianga, on the western coast, presents a marked contrast to the country in the neighbourhood of the Bay of Islands, which has no forests, and but few large trees, being surrounded on all sides by steep kauri-clad hills.

To the southward is the valley of the Waima, which has a breadth of from three to ten miles, and is intersected by the numerous tributaries which flow into the river from the hills on the east side. One of these streams rushes down with great fury for about a mile, and then, in its rapid descent over a precipice of 300 feet, forms a transparent arch, and falls in heavy rain into a kauri glen beneath.

The hills around are generally well wooded, and a fertile flat extending on both sides of the Waima for twenty miles, renders it one of the finest spots in the Hokianga district, and has induced the formation of several European stations. About fifteen miles from the head of Hokianga harbour, the country is open to the Bay of Islands; intermediate between the east and west coasts is the plain of Kaikohe, which contains an area of about twenty-five square miles, and is 800 feet above the sea; it is crossed by numerous streamlets, some flowing westerly pass between the hills, and join the Waima, while others running southerly contribute to form the sources of the Waitangi.

To the northward of Hokianga, and thence to Wangaroa, the country for the most part consists of high ground, broken by innumerable ravines, through each of which a stream of water flows: it contains an immense forest of valuable trees, upon whose outskirts, to the northward, is a fine plain, on which are situated the settlements of Mangonui and Kaitaia.

Kaitaia is within eight miles of the coast; it stands on an eminence commanding a view of the whole district, of which it is the centre. The village, with its church and steeple, its gardens and roses before the houses its fields of wheat alternating

with vines and hops, various fruit-trees and vegetables, and herds of well-fed cattle and horses, afford unmistakable evidence of industry and plenty. On the east is a vast plain, with a dark forest in the middle, stretching out towards the flat marshy estuary of the Awanui river, and terminating in a sandy bay; to the northward a bright line of sand marks the district of Muriwenua, or Land's End, which reaches to the North Cape; on the westward, the wooded range of Maunga-Taniwa bridges the whole inland country between Kaitaia and the Waimate.

The valley of the Awanui, or Awaroa, (on which Kaitaia is situated,) is estimated to contain not less than 120,000 acres of arable land; and in respect of the quality of the soil, facility of cultivation, as well as of water communication, abundance of excellent wood and other building materials, this district would seem to be highly favoured.

The country in the vicinity of the river near its embouche, consists chiefly of mangrove swamps; farther up the stream the banks are higher, and the land perfectly level and open, the soil consisting, in some places, of a stiff black loam,—in others, of a lighter earth, to all appearance admirably adapted for grain. Proceeding onward, the scenery becomes very charming, presenting fields of varied cultivation, well-stocked farm-yards, and natural paddocks formed by the serpentine course of the river.* As the stream is ascended it acquires a greater fall and becomes obstructed by snags; the banks are of the same fertile character until Kaitaia is reached; beyond that point it is only navigable by canoes. The hills which stretch from Kaitaia through the interior are wooded and partially covered with Kauri forests. From the settlement to the western coast the land is excellent.

About two miles to the northward there is a small fresh-water lake containing large eels, two kinds of small fish, and crawfish.

The Maories in the neighbourhood of the valley of the Awanui, or Awaroa, (a tribe of Rarawa,) have greatly advanced in civilization through the labours of the missionaries; they have cut and made various roads, one of which, through the primitive forest, from Kaitaia to the Waimate, is thirty-two miles in length.

* Dieffenbach, vol. i., p. 214.

To the northward of *Wara, Waro*, or *Ahipara*, a native settlement situated a few miles to the westward of Kaitaia, low ridges run parallel to the sea coast, small creeks flowing between them, on the borders of which is a light soil eagerly sought for by the natives for the cultivation of the esculent root, kumera. On one of these creeks (the *Wai-mimi*), there is an extensive bed of lignite. Further north commences the long narrow neck of sand which extends to within about eight miles of the northern extremity of New Zealand, when the land rises and forms the bold precipices of Maunganui headland, offering but one valley of small extent, termed the *Reinga*, and no cultivable land worth mention.

Leaving the northern peninsula, we proceed to notice the country south of Auckland, in which the marked feature of continuous coast ranges is still observable; these, with their collateral buttresses, frequently serve to uphold more or less elevated table-lands of varying, but generally limited extent, from whence spring the highest mountains in the island. Intermediate between the parallel coast ridges flow the rivers Thames and Piako, on the eastward, and the Waikato and Waipa, on the westward; each receiving numerous tributaries from broken rocky mountains during their courses, and irrigating large tracts of valuable country. The Thames and Piako, although entirely unconnected with each other, have their embouchures close together at the head of the deep inlet called Hauraki Gulf, or the Frith of Thames (see p. 263), and flow in nearly parallel courses through the most extensive table-land in the Northern Island, which, commencing at the sea coast, has an average breadth of about twenty miles, and stretches between two elevated hilly ranges which approach occasionally in altitude to mountains, as far as Lake Rotorua, a distance of about a hundred miles.

The probable capabilities of this district have been much dwelt upon. Dieffenbach numbers among the advantages of Auckland, that its port is the natural outlet for the extensive agricultural valley formed by the Thames and Piako (those rivers having no harbour for ships), and says that with the exception of the immediate banks, where the kahikatea pine grows to great perfection, the whole valley is occupied by fern, flax, and manuka. This

* Dieffenbach vol. i., pp. 276, 415.

vegetation is interrupted by large raupo (typha) swamps, which increase toward the mouth of rivers where the country is low and subject to inundations, but offer facilities for easy and effective drainage. This remark applies especially to the flat and swampy land in the vicinity of the lower part of the Piako; farther up, the shores of this river are overgrown with brushwood; still ascending, the banks become higher and slightly wooded, and patches of forest, alternate with open spaces covered with soft grass. During one portion of its course, the Piako is closely bounded, to the westward, by hills of amygdaloidal basalt, having on their surface a white exhausted clay. Wood is only here found in some small valleys and ravines; amongst the trees are some kauri pine, but these are scarce.*

Another observant traveller† has recorded a somewhat similar and equally favourable opinion, stating, that although in the lower part of the great valley of the Thames the soil is too little elevated above the mean level of the tides, and being of a clayey character, is in many parts swampy; yet, as the river is ascended, this defect gradually diminishes, and at the distance of thirty miles from its mouth (to which point it is navigable for steam-boats,) the plain becomes dry, and in many places is so unincumbered, as to be absolutely ready for the plough. In one portion of its course the Thames is skirted by belts of wood, including some timber of great size and value, alternating with extensive tracts of the flax plant, and with spaces overgrown with ferns, myrtles, grasses, and cabbage-palms. In several tracts formerly under Maori cultivation, grass is found in considerable abundance. Dr. Martin describes the soil of the greater part of the valley as a diluvial deposit of clay and earth, with a layer of vegetable mould on the top apparently admirably adapted for the growth of wheat.‡

In opposition to the above opinions, the New Zealand Company, in their exclusive advocacy of their own settlements, and unscrupulous depreciation of every district in any manner connected with Auckland, have taken pains to disseminate the assertion of Mr. Bidwell, that "fully one-half of the plain of the Waiho (Thames), is an impassable bog, covered with high rushes, the largest remaining portion, poor fern land,

† Jameson, pp. 311 312. ‡ *New Zealand*, p. 73.

and there is a considerable portion of wet stony land, covered with rank vegetation, without bushes." (Vide *Rambles in New Zealand*, p. 91.) This description is certainly not an attractive one, yet we find in another page, the writer declaring this very spot to be "one of the most splendid situations for a colony that could be found in the whole world," (p. 73.)*

The Thames district is very thinly populated. Near the entrance of the river is a station of the Church Missionary Society, occupying a most picturesque position on the slope of the eastern mountains, which are crowned by a forest of lofty trees. An arm of the sea, which is joined by a creek, (the Wawakauranga,) bathes the foot of the hills where the buildings stand; a fertile alluvial flat spreads along its left shore, on which there is a large native settlement. About thirty miles from the sea, at the spot where the influence of the tide ceases, is the native village of Opita.

Mata-Mata, an ancient, extensive, and strongly fortified pah, is situated on the right bank of the Waitoa (the main branch of the Piako,) and is remarkable for a spacious church, erected solely by the natives. The area is eighty feet by forty; internally it is supported by two well-finished columns, and lined with fern stalks placed close together, and intertwined with stripes of split wood. The tomb of the principal chief, who died about ten years ago, is described as being an exquisite piece of sculpture; some of the houses also are finely carved. The soil round Mata-Mata is very fertile, and well adapted for the cultivation of grain,† which is grown to a small extent by the Maories.

The opposite or eastern side of that portion of the island now under examination, is chiefly occupied by the valleys of the Waikato and Waipa, and those of their tributary streams, of which a general description has been previously given (p. 270). There being but few European stations in this district, and the number of resident missionaries limited, we are not acquainted with more than its leading features.

When the Waikato—the longest river in

* The truth is, Mr. Bidwill's "Notes," bear the stamp of hasty, though clever, writing, and contain several incorrect and contradictory statements; for instance, he speaks of the Hutt (Port Nicholson), a stream of only a few miles long, as a navigable river, equally useful with the Thames; and after stating in one place (p. 74), that "nothing would be easier than to drain the plain of the Thames, which ought

New Zealand—issues from Lake Taupo, it emerges on a country which, though highly interesting to the geologist, offers little inducement to the immigrant, being broken into hillocks composed of tufa or lapilli, and pumice fossils, cemented together by volcanic ashes, and most irregularly dispersed over the perfectly flat surface of the original table land. The level country, consisting of the same materials as the hills, being as yet but little decomposed, nourishes only a stunted vegetation of low fern, and a coarse, discoloured grass, excepting in the vicinity of the numerous water-courses, where the soil is better, and bears a good many shrubs. Where the Waipapa, a deep mountain tributary, joins the Waikato, from the hilly, and occasionally forest-clad ridge, which bounds it on the westward, the river, here about forty yards wide, presents a very wild scene, losing itself in successive falls in a deep fissure, which it has corroded out of the solid rock. The surface of the surrounding country, in some places, forms regular basins, while craggy, castle-like formations of rock—often lined with a shrub (*metrosideros hypericifolia*), with small myrtle-like leaves, which fixes its tendrils firmly to the rock, in the same manner as the ivy does—crown the hills. Here and there a solitary dragon-tree varies the scanty vegetation of this dreary region, which extends as far to the northward as the Maunga-Tautari range.‡ Between this point and the embouchure of the river there are many fertile tracts, occupied by native plantations. Kaitote pah, the residence of Te Whero-Whero, the principal chief of all the Waikato tribes, is situated on the right bank of the Waikato, a few miles after its junction with the Waipa. It consists of an open quadrangle, with houses ranged on either side, the whole surrounded by a lofty wooden palisade, with an entrance at each end. At one end of the pah is a chapel, built of *tohi-tohi* grass. At a little distance are several neat Christian graves, around which are planted tufts of the white and blue iris.

Taupiri Mountain rises on the opposite bank of the river. The conical sides of this ancient land-mark are clothed with to be done at a very trifling expense, as there are deep water-courses running through the plain in all directions, much lower than the marshy spots," he affirms in another (p. 90), that "the swampy lands of the Waiho (Thames) will cost almost as much to drain as heavy timbered land to clear.

† Dieffenbach, vol. i., p. 413.

‡ *Ibid.* vol. i., p. 321.

thick forests and steep wooded hills, on one of which is the site of an ancient fortification, descend towards the stream. A large extent of country is visible from the summit of Taupiri, including no less than seven fresh-water lakes: that of Waikari is remarkable for having a salt stream running through it, in which the sea-fish called *kanæ* are caught, although they are not found in other parts of the lake. Waikari has a communication with the Waikato, in which an occasional stray *kanæ*, from the salt stream of the lake, is now and then found.

The land around Kaitote—formerly the scene of many a desperate fight, followed by the demoniac orgies of cannibalism—has always been of great value in the eyes of the natives, on account of its fine *kumera* grounds: they now employ it in the cultivation of potatoes, Indian corn, and occasionally wheat. About two miles from the village of Te Whero-Whero is Pepe, a station of the Church Missionary Society, which is thus described by Mr. Angas:—"At a bend of the river, the romantic cottage of the missionary (Mr. Ashwell) suddenly appeared in view. It was as lovely and secluded a spot as it is possible to imagine. The little cottage, built of *raupo*, with its white chimneys and its garden full of flowers—of sweet English flowers—roses, stocks, and mignonnette, was snugly perched on an elevated plateau, overhanging the Waikato, and the access to it was by a small bridge thrown across a glen of tree ferns, with a stream murmuring below."*

The coast hills between the Waikato and the harbour of Wangaroa or Waingaroa separate the waters of the Waipa from the streams which flow directly to the western shore. These hills have an easy slope both towards the plains of the Waipa and towards the sea coast. They are lowest at the Wai-te-Tuna river, which flows from the eastward, where communication with the interior is most easily established. The most populous settlement of the Waikato tribes, is situated near the Wesleyan mission station on the southern shore of Wangaroa Harbour; the northern is partially occupied by European settlers, the land, both forest

and agricultural in this neighbourhood, is excellent.†

The Waipa is a deep and placid stream, meandering through a broad and fertile valley, whose peculiar advantages with respect to soil and climate, have been previously stated (p. 270). At the lower part of the valley, there is very little slope in the land; the river banks consist of a stiff loamy earth with layers of sand, but without any fragments of rock, and the surrounding country is of the most promising description for the growth of grain. Higher up the stream, steep wooded hills sloping down to the water's edge, occasionally alternate with extensive native plantations, which attest the great neatness and skill of the native cultivators; and the general level of the valley is interrupted by a few isolated pyramidal hills of volcanic origin, of which arms consisting of tufa and pumice stone, run off in all directions, often presenting cliffy escarpments on the sides.

The mission-station of *Otawhao* is situated on the banks of a small tributary of the Waipa; around it are numerous dispersed and fortified villages belonging to several distinct tribes, all of whom are comprehended under the general name of Waikato. One of these, named Raroera, formerly a very fine pah, but now almost in ruins, contains the most remarkable relic in New Zealand, a *papa tupapakau*, or mausoleum, erected by Te Whero-Whero, in honour of his favourite daughter. This extraordinary monument was entirely carved by one individual, a lame man, named Parinui, whose only tool was the head of an old bayonet. The tomb is about twelve feet high, in the form of a box, with a projecting roof, supported by grotesque figures. The carving is exceedingly rich; the eyes of the figures are formed of *pawa*, or pearl shells (*haliotis*), and the feathers of the *kaka* and the albatross decorate the seams of the wood work. Near the mission-house of Otawhao, is another ancient structure, described by Angas as one of the finest remains of Maori ornamental architecture still extant. It is called Maketu house, and was erected by a chief named Puata,‡ in commemoration of the heathen *tohungas*, and so reasoned with the chief that he embraced the religion he had once despised—had a school established within the pah; and as he lay sick, was accustomed to call his tribe round him and hold morning and evening prayers. In this state he lingered several months; his last words to his people were, "Receive the word of God, and hold fast on Jesus Christ."—Angas, vol. ii., p. 150.

* Vol. ii., p. 42. † Dieffenbach, vol. i., p. 306.

‡ Puata was the principal chief and the greatest warrior of his tribe; until his last illness he had contemptuously rejected the doctrines of Christianity. During that time he was visited by Mr. Morgan (the zealous missionary of Otawhao), who, after considerable difficulty, persuaded him to take medicine instead of trusting to the sorcery and charms of the

taking of Maketu, on the east coast, by the people of his tribe; around the roof are a number of savage figures carved in wood, and intended to represent the various warriors engaged in the battle, all of whom have their tongues protruding, as a mark of the extreme defiance with which they regarded their enemies. The chapel at Otawhao, a commodious structure, which measures eighty-six feet by forty-two, was built solely by the Maories. Angas gives the following interesting description of the circumstances of its erection:—

"The ridge pole, a single tree-stem, eighty-six feet in length, was dragged by the natives from the woods a distance of three miles; and all the other timber was likewise conveyed by them from a similar distance. The rafters are all detached, and most of the wood work is fastened together with flax; the sides are beautifully worked with fern stalks, tied together in cross-stitch with *aka*, a species of wild climber, which gives to it a rich and finished appearance. The entire design originated with the natives, who formed this spacious building without rule or scale, and with no other tools than their adzes, a few chisels, and a couple of saws. After the erection of the frame work the season was so far advanced, that fearing they should not be able to complete it in time, the Otawhao people requested a party of one hundred Maunga-tari-tari natives to assist them in its completion; to whom they gave the entire sum that had been paid them by the Missionary Society, amounting in value to about £23 sterling; they also killed a couple of hundred pigs, that their friends might live well during the time devoted to their assistance. The windows, which are of a gothic shape, and thirteen in number, were fetched from Tauranga on the coast—a distance of seventy-five miles from Otawhao—by fourteen men; who carried them on their backs, over mountains and through forests, without any payment whatever. The whole tribe, amounting to about 600 or 700 natives, are now nearly all Christianized."—(Vol. ii., pp. 141, 142.)

Governor Grey, on visiting the "extensive and fertile districts of the Waikato and Waipa," in the year 1849, declared himself—

"Both surprised and gratified at the rapid advance in civilization which the natives of that part of New Zealand have made, during the last two years. Two flour mills have already been constructed at their sole cost, and another water mill is in course of erection. The natives of these districts also grow wheat very extensively, at one place alone the estimated extent of land under wheat is 1,000 acres. They have also good orchards, with fruit trees of the best kind grafted and budded by themselves. They have extensive cultivations of Indian corn, potatoes, &c., and have acquired a considerable number of horses and horned stock. Altogether I have never seen a more thriving or contented population in any part of the world. The districts I am describing are of the most fertile character, and the quantity of land cultivated or used by the natives is quite insignificant, compared with the extent of fertile country. There would also be no difficulty whatever in ac-

quiring any quantity of waste land, that might be required there, as the chiefs were most earnest to have Europeans settled amongst them, and offered to give up any portions of the country to the government for the purpose of locating European settlers upon. * * * The marked and rapid improvement which has taken place in the natives, inhabiting the districts to which I am alluding, is in a great degree to be attributed to the exertions of the missionaries residing amongst them, whose arrangements for the religious welfare and social improvement of these people appeared to be only deficient in one respect, which was in the extent of the means provided for the education of children in the districts confided to their care; but to the honour of some of these gentlemen I should state, that they are in no respect to blame for this, as some of them, out of their own small means, maintain very efficient schools for the education of native children; and I think that the defect to which I have alluded will shortly be wholly removed by the operation of the law which has recently passed, providing for the education of native children."*

The country to the westward of the Waipa, between the harbours of Wangaroa and Kawia, exhibits dense and continuous forests, with steep eminences, whose summits command many exquisite prospects; occasionally extensive clearings have been made for potato grounds.

The banks of the Oparau, or Oparerc, a small river a little to the northward of the Awaroa river, are of moderate height, and the soil is a good loamy earth, covered with a luxuriant vegetation of fern and flax; the hills in this vicinity ascend gently from the sea coast, and descend gradually to the interior; they are separated by ravines and by narrow valleys. The formation of the hills is volcanic, consisting of a solid basaltic matrix, with numerous pentagonal columns of augite. Many parts are covered only with fern; others, especially the ravines, are still clothed with forest, which appears to have formerly covered the whole. The country bordering the Waiharakeke river, which flows into Ahuahu harbour (an arm of that of Kawia), is varied and romantic; steep banks, clothed with luxuriant foliage, rise on either side, and almost every opening discloses a Maori settlement.

There is a Wesleyan mission station here, situated on a point of land jutting into the harbour; a glassy sheet of water extends in front of the house, and beyond it rises the bold and rugged outline of the mountain of Pirongia. The chapel stands on an elevated terrace behind the house. At Te Pahe, a small heathen settlement several miles up

* Despatch from Governor Grey to Earl Grey, 1st March, 1849. Parliamentary Papers for 1850 p. 27.

the river, is a *wahi tapu*, or sacred repository of the property of a deceased chief, which when visited by Mr. Angas in 1845, consisted of an enclosure surrounded by a double row of palings. Within the inner row, which was painted red (the colour used by the Maories to represent mourning), on a frame-work of raised sticks, were arranged the weather-worn garments, chests, muskets, and other property belonging to the deceased. Calabashes of food and of water, and a dish prepared from the pigeon, were placed for the use of the departed spirit, who the heathen natives aver comes at night and feeds from the sacred calabashes. A small canoe, with sail and paddles, was also within the enclosure, to serve as a ferry-boat for the spirit to enter safely the abodes of eternity. The Maories view the place with superstitious reverence and fear, and will not approach within some yards of the outer enclosure.

To the south-east of Kawia* lies the elevated range termed the Mountains of Rangitoto, which forms a continuation of the west coast hills, and connects them with the group of the Ruapahu, on whose west slope is the source of the Mokau. This stream flows in a narrow valley, formed by two ridges, which branch out from the Rangitoto range, and falls into the sea about sixty miles to the northward of New Plymouth, or Taranaki. The scenery in the upper part of its course, especially near the Maori settlement of Whakatumu somewhat resembles the highlands of Scotland in the bold outline of the fern-clad hills, and the barren rocks jutting up in huge and picturesque masses. In this secluded spot a European missionary and his wife, have taken up their abode in a cottage on an elevated and rocky steep, overlooking an extensive country.

Four miles from Whakatumu the river dashes down a perpendicular wall of rock, sixty feet in height; the steep cliffs on either bank are clothed with evergreens, and

on the opposite side of the glen, the broken rocks resemble castles, fortresses, and towers. Beyond the falls, the river winds its way between barren-looking hills, with blocks of micaceous schist cropping out. The land in the Mokau valley is fertile, though rugged, and much occupied by swamps, which, as in most parts of New Zealand, would admit of easy drainage.

THE SETTLEMENT OF NEW PLYMOUTH, OR TARANAKI, is situated twenty-five miles to the northward of Cape Egmont. It is 125 miles from Auckland (*via* Manukao harbour), and 180 from Wellington by sea, or 238 by land (*via* Wanganui). The town, which has been well laid out by its first surveyor, Mr. F. C. Carrington, slopes upwards from the sea-beach, and with its neat white houses, contiguous cultivations, green forests, and back-ground of wooded hills, crowned by the snow-capped cone of Mount Egmont (see map), presents a pleasing prospect. The country around, is undulating, broken, and interspersed with small dells, which vary in size from half an acre to two or three acres, are densely wooded, and generally contain a small but unfailing spring of fresh water. Of this indispensable element there is an abundance; between the town and the Waitara river, a distance of ten miles, there are eight running streams; springs and rivulets abound, and in the wells that have been sunk, water has been generally procured at from thirty to forty feet depth.† The want of a harbour (*vide* p. 268) is unquestionably a serious drawback to the settlement; the progress of the little town, or rather village, however, bears witness to its great agricultural advantages, and to the energy and civilization of its limited population. The most interesting building is a substantial granite-built church, offered by the first clergyman (Mr. Bolland) and the first settlers of Taranaki, as a thank-offering to Him who had guided them in safety from their native country to

* A few miles from a native settlement named Pari-Pari, situated on the banks of a small stream, flowing from the southward into Kawia Harbour, there are some large limestone caves, presenting the usual features of such formations. The entrance to the largest cave is a spacious arch, in the side of a perpendicular wall of limestone rock. For about sixty feet the cave extends inwards, hung with stupendous masses of stalactite. The stalagmitic encrustations on the floor assume the forms of large mushrooms, tables, and pillars, the latter frequently joining with the stalactites from above, form picturesque columns. At the inner extremity of this anti-chamber, at the bottom of a steep descent, a

rapid subterranean stream flows across the cave: on the opposite side of the stream, twenty feet above it, is a corridor of thirty feet in length, filled with sparkling stalactite columns, leading to a chamber of indescribable beauty, which "appeared as though gnomes and fairies had been at work to adorn the magic hall. The roof hung with stalactites of the most exquisite and pearly whiteness, was supported by columns of yellow and transparent spar, that gave it the resemblance of a natural temple, and the crystalline walls and floor were covered with a sort of fluorine bloom of the most delicate hue and texture."—Angas, vol. ii., pp. 91, 92.

† Hursthouse's *New Plymouth*, p. 13.

this distant land.* About two miles from the church, on the banks of a small clear stream, called the Henui, is a small rustic chapel. There are besides a Wesleyan and Primitive Methodist chapel, an excellent hospital, two taverns, a gaol, and police barracks; three flour mills, two small breweries, and a tannery; and at Moturoa there are two shore whaling establishments. A monthly Court of Requests is held for the recovery of small debts. New Plymouth has as yet no "journal." A small public library, and a literary institution, have been recently established. The overland mail from Auckland to Wellington, carried by natives, passes through New Plymouth; arriving north and south every alternate Saturday, and departing the following Monday. The quickest communication either with Auckland or Wellington is by sea, as dull sailing coasters, although generally three or four days in making the trip, can perform it in thirty hours.†

The New Plymouth district is naturally divided into three parts;—the *first* of these is a mere strip, extending along the coast, covered with light fern, interspersed with tufts of grass; the soil is largely mixed with black iron sand. This strip, according to Mr. Hursthouse (one of the principal settlers), has been found to produce excellent crops of vegetables. The *second* division comprises a large tract clothed with fern six to eight feet high, intermixed with bushes, and the tall tohi-tohi grass. The surface is a vegetable decomposition of from seven to ten inches deep, matted together by the fern root, with a light yellow sub-soil entirely free from stones, shells, gravel, or clay. The principal farms are on this land. The chief difference as respects the cultivation of this soil and the preceding, is, that it requires more exposure before cropping. The *third* division contains the bush or forest land, and extends along the country in an irregular line, two to five miles from the coast, and a considerable distance back into the interior. The soil resembles the second division of fern land, but is ready for cropping at once.‡

The agricultural capabilities of this part of New Zealand, which has been justly termed "its garden," are attested by various

authorities. Bishop Selwyn speaks of New Plymouth as his favourite settlement, and declares that "no one can speak of the soil or scenery of New Zealand till he has seen both the natural beauties and the ripening harvests of Taranaki." Sir G. Grey says, "I have never in any part of the world seen such extensive tracts of fertile and unoccupied land as at Taranaki;" and Dr. Dieffenbach, the unprejudiced and intelligent explorer of the Northern Island, states, "the whole district of Taranaki, as far as I have seen, rivals any in the world in fertility, beauty, and fitness for becoming the dwelling-place of civilized European communities."§

When the New Plymouth settlement was founded in 1841, there were not more than fifty Maories there, the remnant of the Ngatiawa tribe whom the Waikato, in 1834, under Te Whero-Whero, had conquered. Many were carried into captivity, others fled and settled around Cook Strait, but when the Europeans arrived, some of the latter returned to their country, and a large number were released from captivity by the Waikato, owing to the Christian influence exercised by the missionaries. There are now about 1,000 Maories living in the vicinity of the town, located in settled habitations. They cultivate a considerable extent of land—are possessed of more horses and coasting vessels than the Europeans, "and are in fact becoming useful and influential members of the community."|| A single tribe (residing to the southward of the settlement,) have paid £300 to Europeans for the construction of two grist mills, and a third is now in course of erection for them. All are deservedly praised for their industry, sobriety, honesty, and peaceful habits: and through the unwearying exertions of the Episcopal and Wesleyan ministers, they have made remarkable progress in education; so much so that of the adult males, it is estimated that three out of four can both read and write.

A densely wooded range separates the undulating country, in which New Plymouth is situated, from that to the eastward watered by the tributaries of the river Wanganui. Great part of this extensive tract would appear to be broken and moun-

* Journal of Bishop Selwyn's Visitation Tour in 1848, p. 40.

† Hursthouse, pp. 62, 63.

‡ *Ibid.* pp. 13, 14. This little work contains much valuable information of a practical nature

adapted for the use of agricultural emigrants of small capital, to whom the New Plymouth settlement offers especial advantages.

§ *Travels in New Zealand*, vol. i., p. 150.

|| Hursthouse, p. 159.

tainous, and much occupied by dense forests, except round the immediate base of Tongariro, which is clothed with coarse tufted grass. In the various patches of ground cleared by the natives, the vigour of the plantations prove the fertility of the soil. During the upper part of its course the Wanganui flows through a very remarkable volcanic region, consisting of a plain several miles in extent, and entirely destitute of trees, broken with deep ravines and chasms, and diversified with numerous abrupt little hills, like Alps in miniature, some of which rise into tapering cones resembling craters, while others present the appearance of castles and steep ridges crowned with masses of rock, the whole backed by distant mountain ranges. The entire country is covered with blocks of pumice stone, and the rocks appear of igneous origin, the rounded hills presenting cliffs of tufaceous lava, or of lapilli of pumice and sand cemented by volcanic ashes. The only vegetable production is a coarse wiry grass, with occasional tufts of low fern. Through this desolate region the Wanganui, here about twenty yards in breadth, winds its serpentine course over a bed of white sand and pumice, through which the river has formed a deep channel, presenting here and there regularly terraced sides and platforms.

The singular congeries of mountains—some isolated, some in short ridges; the lakes and boiling springs, the pumice-stone plains and dense forests, which form the distinguishing characteristics of the interior of the Northern Island, have been described; but on the actual capabilities of the central districts, our information is too scanty to afford grounds for a satisfactory opinion. Many large tracts are said to be quite destitute of timber, and much more level than the country near the sea-shore. To the north-westward of Lake Taupo there is a considerable extent of available land, including Matahanea and several aboriginal settlements. The region to the westward, in the vicinity of the boiling springs, is described as resembling land over which a flood has swept, leaving it torn, or in many places ridged with terraces formed by slow subsidence, but altogether devastated and dreary; shallow ravines covered with gravel are observable here and there, often turning at sharp angles where the water had found resistance. Sometimes a higher cliff appears, consisting of a tufaceous conglomerate—the upper strata, a pumice-stone

gravel, is covered with stunted ferns and lichens; occasional rushy moors vary the scene, and also swamps and numerous rivulets, near which the vegetation has a fresher verdure.*

In the route from Lake Taupo to Lake Roto-rua, some grass land is met with. The general composition of the soil round the latter lake is,—firstly, a black mould a few inches thick, then pumice gravel one foot thick, below this a yellow sandy loam about six feet thick, and afterwards, another bed of gravel. This soil, if not fertile, cannot be called barren, and might be much improved by a good system of agriculture. A station of the Church Missionary Society is situated on the eastern shore; a valley runs from thence to the eastward, and is, in several places, very promising. To the northward of Roto-rua a dense wood stretches as far as the extensive flat on which the Mission Station at Tauranga Harbour, Bay of Plenty, is situated, covering the hills which run along the eastern coast, bounding on one side the interior and comparatively open table-land, and on the other, sloping gradually, and spreading out into flat land near the sea-shore. The gigantic trees in this forest are festooned by creepers and wild vines, which envelop the traveller in a network, and render his progress wearisome and laborious in the extreme; for more than half the distance, however, a good wide horse-path has been cut by the natives of Roto-rua, at the expense of the mission, the three miles nearest the lake entirely cleared of stumps, and coated with powdered pumice-stone, forming an excellent road. The soil is good throughout, consisting of pumiceous gravel richly mixed with vegetable mould.

Tauranga was, in former times, an important place for the pig and flax trade, and several European traders have lived there for many years. Dieffenbach (writing in 1840,) says the natives are not inclined to sell any land, and their number is sufficiently large to enable them to cultivate their beautiful district themselves, if a durable peace were established among the different tribes (vol. i. p. 408). This desirable end, has, to a very great extent, been accomplished: the propagation of the Gospel of peace has greatly lessened and mitigated the quarrels which rendered native property so insecure, and villages are

* Dieffenbach, vol. i., p. 330.

springing up in all directions, throughout the fertile coast district extending from Tauranga to beyond Hawke's Bay, the whole of which is now professedly Christian. Archdeacon William Williams took up his abode, with his family, at Poverty Bay, or Turanga, in 1840, and in that same year the number of individuals assembling regularly for worship in this district, were estimated at no less than 8,000.*

Opotiki, a central mission station of the Bay of Plenty, is situated in a rich valley containing some thousand acres, with a river running through its centre, into which vessels of thirty tons can enter and lie with safety. The population comprises about 1,000 Maories, who have built a large chapel, and are represented as an industrious, plodding, commercial people, possessed of horses and cattle, and of six small vessels, which they navigate themselves, carrying on a large trade with Auckland and other places, in pigs, potatoes, Indian corn, and wheat. They make their own bread, and supply their visitors with abundance.† One, and, occasionally, a second, Roman catholic priest resides here. At the native villages of Wakatane, Matata, Tunapahore, and the Kaha, the beneficial effects of missionary labours are likewise evidenced in the growing civilization of the people. At Waiapu River, a population of about 2,000 souls, who, as heathens, lived huddled together in three fortified paha, now dwell in peace and security, scattered over their fertile and picturesque valley, or along the coast on either side, congregating on the sabbath in central spots, around the chapels erected by them for divine service. The river is very shallow, and Bishop Selwyn, who, following its course, traversed an old and scarcely practicable inland war-path leading from Rangitukia paha to Opotiki, says, that without counting the exact number of fordings he had been compelled to make, he contented himself with "the general impression that it was a day of as much wading as walking."

A mission station has been recently established at Kawa-Kawa (near East Cape), on a plain immediately adjoining a mountain on which the original inhabitants resided, but from which, on the introduction of fire-arms, they were swept off,

* *Church Missionary Intelligencer*, for June, 1851; p. 126.

† *Ibid*, p. 127.

almost to a man, by the natives from the northern part of the island.

At various places between East Cape and the Wairoa, a river flowing through an extensive and fertile valley to its embouchure in Hawke Bay, there are several mission stations and numerous native villages, whose names it is not necessary to record. The country in their vicinity has been little explored, on account of the great difficulties it offers to the traveller, who is obliged to follow the old native paths over frightful cliffs, steep and lofty mountains, across swamps and rivers, or in the soft and yielding sand of the seashore. On the southern side of Hawke Bay, in the neighbourhood of the Ahuriri river, extensive grassy plains are found; and the Tuki-tuki, which enters the bay a little to the southward of the embouchure of the Ahuriri, flows amid a succession of plains and gentle hills, chiefly covered with grass. Near the Waipawa, a tributary of the Tuki-tuki, is a small native village, pleasantly situated on an island in the centre of a lake named Roto-Atara, surrounded by grassy downs.

Of the large tract of country extending between the coast district, whose leading features have been above enumerated, and the immediate borders of Lake Taupo, little more is known than that it is extremely broken and mountainous: on the right or eastern bank of the Upper Waikato, there are said to be some grassy plains.

WELLINGTON AND THE SOUTHERN DISTRICTS.—In order to mark a geographical division of the island, I proceed to define a *southern* peninsula, which may be said to extend from Cape Matau-a-Mani, or Kidnapper Point, on the east coast, to the north limit of the Wanganui settlement on the west coast, and thence south, with a gradually decreasing breadth to Cook Strait. Along the northern limit, the greatest breadth from east to west, is about 125 miles; at Cook Strait, about 40 miles; the extreme length of the east or outside of the curve (formed by the peninsula), 170 miles, and of the west or inner curve, about 110 miles.

The above extensive track of country has an almost unbroken coast-line, compared with that contiguous to Auckland, but it is marked by the same features of continuous ridges, with intervening spurs, table lands, valleys, forests, and swamps; though from its greater breadth these are

on a larger scale than on the northern peninsula.

From Cape Matau-a-Maui, the south extremity of Hawke Bay, to Cape Palliser in Cook Strait, the coast is bounded by a range of moderate height, varying from five to fifteen miles' distance from the shore.

The opposite coast is likewise bordered by hills, but their outline is far less regular and connected. Through the interior the lofty Rua Hine range, stretches in a north to south-east direction, terminating in two branches, called the Tararua, or Remutaka Mountains. The extremity of the latter ridge forms the tongue of land, which, stretching into the sea, separates Palliser Bay from Port Nicholson.

Wellington, the chief settlement formed by the New Zealand Company, is situated at the south-east corner of Port Nicholson,* on the shores of an inner basin, which is called Lambton Harbour. The houses lie in tiers, scattered around and above the margin of the bay, for a distance of three miles, and being closely hemmed in by steep hills clad with thick forest, form a picture which can scarcely fail to please the eye of an artist, but is calculated to produce a very different impression on that of the agricultural immigrant. The town occupies two level spaces of limited extent; Pipitea, or Thorndon, and Te-Aro Flat, on the western and southern sides of the harbour, and stretches over some of the least impracticable declivities. On or near Pipitea Flat, are the government-house, church,† law courts, police-office, and the residences of many of the principal inhabitants. On the Te-Aro Flat are the custom-house, exchange, bank, Wesleyan chapel and mission-house, Roman catholic chapel, jail, a second set of barracks, and several strongly-built houses and warehouses. On the beach, which is the main line of connexion between the two flats, stands the Scotch kirk, a conspicuous object in a line of taverns, shops, and stores. An excellent hospital for Europeans and natives was opened in 1847. It is two stories high, and consists of brick, plastered with Roman

* Port Nicholson has been described at p. 266.

† So lately as 1848 there was only a temporary church at Wellington; the bishop of New Zealand writing in that year, says, "with the exception of a piece of land which we bought at Te-Aro (south end of Wellington), we are still without a site for a church in a town half as large as Constantinople. The piece originally marked out is a mere water-

cement outside. There are three cemeteries, in secluded spots; the largest is appropriated to the use of all protestants, whether European or Maori; the other two are allotted for the burial grounds of Roman catholics and Jews. Wellington has a Mechanics' Institute and a Savings' Bank, and its settlers have associated themselves in societies under the denominations of the Freemasons' Lodge, the Independent Order of Odd Fellows, and the Loyal Antipodean Lodge. A Horticultural Society (always a useful association in a young settlement), was established as early as 1841; it receives seeds of the best kinds from that of London, and distributes them among its members; holds shows of fruits, flowers, and vegetables every three months, and gives small prizes for excellence in these, as well as in the cultivation of cottagers' gardens.‡

The progress which the town has made furnishes undeniable evidence of the energetic and enterprising spirit of its settlers, who have struggled, and are still struggling, through many difficulties, by means of a heavy expenditure of labour and capital. The want of good and level land near the town is a grievous disadvantage, and the results of the fundamentally erroneous system on which the settlement was formed, impose a heavy clog upon their most strenuous exertions. Not the least of the obstacles with which they have now to contend has arisen from the exaggerated scale on which the town was originally planned, and the gambling manner in which the sections, after long delay (*vide* Div. v., pp. 154, '5), were allotted, indiscriminately, to speculators in London, or *bona fide* colonists. To provide 1,100 acre sections of at all available land, it was necessary to extend the boundaries south of the harbour, to a distance of two miles from the beach. Twenty-one sections, extending for about half-a-mile along the beach, at the southern extremity of the harbour, are private property; but, with this large exception, the public road lies between high-water mark and the boundary of private property. A public wharf, with 140 feet frontage, occupies the centre of the above-named private property, and there

course, scarcely available even for the small parsonage which stands perched upon the only flat part of the ground, with a most uncomfortable exposure to the wind and rain. Of course I declined to accept such a site for the main church of the Southern Division.—Visitation Tour in 1848, p. 90.

‡ *Handbook for New Zealand*, by a late Magistrate of the Colony; p. 202.

are several substantial jetties at other parts of the beach.

Behind the first street are various houses and structures, including a windmill, brewery, steam flour and sawing mill, &c. In the back-ground, rise the steep, wooded heights of Tinakore, which are included in the belt of land reserved all round the town for public purposes. Only the few main streets, in which sections are built upon, or otherwise occupied, are even marked out, and one or two of the principal ones are alone made passable for wheeled vehicles. No paving has been attempted; and the only street-lights are the lamps which the licensed publicans are required to maintain burning over their doors all night.*

The Te-Aro flat, or southern part of the town, near the beach, consists partly of undrained marsh, and partly of a poor, gravelly soil. Near the foot of the western hills, however, it improves sufficiently to permit the formation of several well-cultivated gardens. The more distant town sections to the south are covered with natural pasture, of inferior quality, for which they seem alone adapted. The soil of Thorndon flat, on which is the north-western portion of the town, is said to have been exhausted by the potato cultivations of the natives, but the careful cultivation of the settlers has reclaimed some limited spots, and given the gardens a cheerful appearance.

Immediately beyond the town belt, on the other side of the Tinakore range, is the Karori district, which consists of an undulating table land, 600 feet above the sea, surrounded by higher hills; and contains about 1,200 or 1,500 acres of land, originally covered with dense forest, in which partial clearings have now been effected by the axe of the settler. Wade's Town comprises a rugged hill of 100 acres, immediately adjoining the northern extremity of Wellington. It is principally occupied by industrious cottagers. There are several good roads in the vicinity of Wellington: that called Pitone lies along the western shore of Port Nicholson, close under the steep and wooded hill-side, from whence jutting buttresses of rock were blasted to make space for a passage. The Porirua road is the principal outlet from Wellington to the northern districts, through the Kenepuru valley.

With the exception of one or two patches

* *Handbook of New Zealand*, p. 97.

of level land, close to the mouths of small streams, the whole eastern shore of Port Nicholson is steep to the water's edge. The peninsula which forms the western shore of the entrance of the Port, called Watts' Peninsula, contains about 1,800 acres, chiefly of steep hills, totally devoid of timber. In its centre a lake, covering about 100 acres, is in course of drainage, and about 200 acres of swamp around it, will probably be also rendered available for pasture or tillage. An isthmus, which connects the two indentations called Lyall and Evans' Bays, is a sandy tract, totally unfit for cultivation of any kind. A race-course has been laid out on the Peninsula, closely adjoining this tract.

The *Ohiro* or *Happy Valley*, the *Kaiwarawara Valley*, and the *Makara Valley*, are situated beyond the ridge of hills which form the western boundary of the Wellington town district. They are generally narrow, with steep sides, affording among "roughish" sections a few hollows capable of tillage. To the south and west of Makara Valley a tract of high hilly ground extends to Cape Terawite, to the northward of which is the Ohariu district, which contains some wooded hollows, cut off by a steep and rugged country from Wellington, and approachable only by two precipitous Maori footpaths.

The *Valley of the Hutt*, a small river flowing into the northern part of Port Nicholson, is divided into two districts, upper and lower; the latter extends somewhat in the form of a triangle, having its base on the shores of the harbour, and its apex at a gorge about six miles and-a-half from the sea, where the Tararua and Remutaka mountains approach so closely to each other as to leave room only for the passage of the river. Below this gorge, the Hutt gives rise to three watercourses, which occasionally overflow, and render a limited area of soil very fertile. Ninety sections of 100 acres each have been laid out, and eighty-eight selected in this district, and considerable efforts have been made, with some degree of success, to cultivate different portions. The village of Aglionby, on the west bank of the river, is said to be thriving. The exertions of the Hon. H. W. Petre, of the late Mr. Francis Molesworth, and of other enterprising colonists, to render valuable the unfortunate site chosen by the New Zealand Company for an agricultural colony, deserve commendation.

The *Upper Hutt valley*, to the north of the gorge, is a level tract, about eight miles long, by two broad; the soil is inferior to that of the lower vale, and it receives less of the alluvium from the floods: the weather, however, is milder, the neighbouring hills sheltering the district from the cold southeasterly winds. Sixty-two sections have been laid out here. Two smaller valleys open into the Hutt from the eastward; that formed by the Mungaroa streamlet is almost entirely a swamp, yet, for want of better land, thirty-eight sections have been laid out there, and twenty have been taken; on that through which the Pakiritahi flows, fourteen sections have been laid out and taken. The Hutt road is continued up the latter valley.

The *Wairarapa Valley*, or *Plain*, situated between the Remutaka Mountains and the eastern coast range, is about sixty miles in length from south to north, with an average breadth of more than nine miles, and contains about 400,000 acres; four-fifths of this extent are on a dead level, intersected by several swamps, and the remainder undulating ground. Of the level land, about 200,000 acres are covered with grass, fern, anise, flax, and tohi-tohi (a sedge-like plant eaten by horses and cattle). The undulating surface consists chiefly of grass or fern tracts. Of the plains, about 80,000 acres are finely timbered, and the soil is there particularly good; in the open land at the lower part of the valley it is in general clayey and gravelly. The Ruamahunga River runs from north to south, through the centre of the valley, and disembogues in a shallow lake termed the *Wairarapa*, which communicates with another and smaller lake separated from *Palliser Bay* by a variable bar of sand, and surrounded by a tract of low swampy ground. The area of the two lakes is about 50,000 acres. The channel of the river, until it leaves the lakes, is deep enough for a vessel of fifty tons; above them a whale-boat may ascend for twenty or thirty miles, after which it presents a succession of shoals and falls, and is only available for canoes in times of freshets, when the floods sometimes rise suddenly to the height of sixteen feet.

The *Wairarapa Vale* is divisible into three parts; the lowest, or that nearest the sea coast, is mostly swampy, and covered during the winter months with water; the eastern portion consists chiefly of grass

land, on which European settlers have, by renting tracts from the Maories, established stations for grazing stock; the lower ground near the river, comprises the woodland previously described. Above these, in what may be termed the *Upper Wairarapa*, which is by far the largest portion of the valley, there are fine grassy plains intersected by belts of wood, watered by numerous streams, and supposed to possess a very rich soil. The above details are extracted from an able description of the *Wairarapa Valley*, which appeared in the *Cook's Strait Almanack*, for 1846. This district promises to be so valuable, that I also subjoin a condensation of those furnished by Mr. Tiffen to the New Zealand Company. This surveyor estimated the contents of the *Wairarapa* and *Ruamahunga* districts at 350,000 acres, which he divided as follows:—water, 55,000 acres; swamps, 20,000; unavailable hills, 25,000; wooded land, 80,000; grassy plains, 170,000. The first head comprises the upper and lower lakes, the rivers *Ruamahunga*, *Hungaroa*, *Waingowa*, and small streams; some of the *swamps* he considered undrainable, others might be converted into rich pastoral or agricultural land. Several of the isolated eminences included under the denomination of *unavailable hills*, might likewise possibly be made to afford tolerable pasture. The *wooded land* he describes as extremely rich, the forests, in extent, from ten acres upwards, are scattered over the whole extent of country. Among the *grassy plains* there are tracts of 10,000 acres perfectly level, where good grasses grow as luxuriantly, and nearly as close in the sward, as in English meadows. The substratum of many of the plains is conglomerate, with but a few inches depth of mould, unfit for anything else but grass; the soil is, however, extremely variable; in some places of the best quality, in others very indifferent; in many very sandy, in some gravelly; in others it consists of a stiff poor clay.*

The distance from *Wellington* to the ferry across the *Wairarapa Lake*, is about forty-one miles along the coast, and the way is, unfortunately, rough and difficult for cattle and sheep—another somewhat shorter road will probably be soon, if, indeed, it is not already, formed through the *Hutt District*, and along the eastern foot

* Nineteenth Report of the Directors of the New Zealand Company, pp. 61, 62, 63.

of the Remutaka range. To the northward of the Upper Wairarapa district, are the *Hauriri Plains*, which are said to contain "an area of 500 square miles of level grass land;"* and still further to the northward is a tract of level country watered by the five streams which unite to form the Tuki-tuki. This plain is called *Rua O Taniwa*, and is described by Bishop Selwyn as "stretching as far as the eye could reach, and covered in almost every part with grass, without a bush or tree of any kind, with the exception of two small Kahikatea clumps, the small remains of an ancient forest which had formerly occupied the ground."† The fine river *Manawatu* flows from north to south, in a direction parallel with the Rua Hine Range, before making a decided bend to the westward. During this portion of its course it flows in a very deep and winding channel, with precipitous wooded banks feathering down to the water's edge. There are several small native settlements on either shore. The adjacent country has been very imperfectly explored; its general character is reported to be tolerably level, with much timber, and many swamps.

Between the sea and that portion of the coast range which forms the eastern boundary of the Wairarapa Valley, there is a long narrow strip of flat land, called the *Awaawa Motuai table-land*; and below it, in the south-eastern angle of the island, there are also some grassy terraces: the whole of this portion of New Zealand, (if it do not prove too damp,) will probably be occupied by extensive cattle, horse, and sheep stations. Merino sheep are said to thrive well at the Wairarapa; and the average annual increase of the different stations is stated by Mr. Fox (the late principal agent of the New Zealand Company,) at 90 per cent.‡ The climate is very different to that of Wellington; being more inland, it is less exposed to tempestuous winds, and is consequently warmer, with less rain during the winter months.

The country to the northward of Port Nicholson, through which the Lower *Manawatu*, the *Rangitiki*, *Waingaiho*, *Tarakino*, the lower portion of the *Wanganui*, and other small streams, flow towards the west coast, is bounded inland by the *Rua Hine* and *Tararua Mountains*, which send

out several spurs towards the sea-shore. The intervening space contains considerable tracts of level land, sometimes covered with grass, but more frequently with fern, and intersected by numerous water-courses and swamps. Many of the latter may be drained, as the fall of the land is favourable to carrying off the surplus water. On this line of coast several small hamlets have been formed as offshoots from Wellington, when it was found that the neighbourhood of Port Nicholson did not contain one-twentieth part of the assumed "cultivable" land which had been laid out in paper sections, and sold by the New Zealand Company in England, in anticipation of the millions of acres of first-rate land that Colonel Wakefield was confidently expected to purchase with a portion of the muskets, gunpowder, red blankets, and jews-harps, &c., which formed the freight of the *Tory*, in 1839; (vide p. 157.)

On, and in the near vicinity of the hilly and forest-clad shores of the harbour of Porirua (dark pit), eighty-four acre sections have been laid out, and a small hamlet called *Paramatta* is situated on a low point of clear land on the north side of a narrow gut, by which the waters of the inner harbour communicate with a deep bay, opening into the sea nearly opposite the island of Mana. Commodious stone barracks were built here in 1846. A good road was constructed at nearly the same time from Wellington, a distance of about twelve miles, at the joint expense of the Company, (who commenced it,) the government, and the settlers, (who contributed some amount of both labour and materials,) by working parties of troops and natives, at a total cost of about £700 per mile.§

In the midst of all the warfare and disputes raised by the "Land Question," it was generally agreed that five or six hundred acres of land should be freely given up to the Bishop and his successors, for the purpose of founding a college in which the Maori and English youth might be trained up together in the knowledge of God, and in the habits of civilized life. Bishop Selwyn selected for the site of this New Zealand "Trinity College," *Witereia*, a peninsula immediately opposite Mana Island, where a space of 600 acres is separated from the main land by *Titahi Bay* and *Porirua Har-*

* *Cook Strait Almanack*, for 1846.

§ *Hand-book*, by a late Magistrate, p. 111.

bour, with an isthmus of three-quarters of a mile between the two waters. This nearly isolated position is within little more than a mile of the main road to Wellington. About 200 acres are covered with wood, the remainder is open, rising into grassy hills, with steep declivities to the sea-beach. From the bold headland of Witereia there is a full view of Mana Island, and a beautiful prospect of the hills of Middle Island, or New Munster.*

A few miles of broken woodland intervene between Porirua and *Pukerua*, a native village, built on the top of a steep bank, commanding a beautiful sea view, with the island of Kapiti in the distance. Six miles further is the Maori settlement of *Pari-Pari*, situated on a rocky spur, which juts into the sea at high water; a little beyond this the hills commence slowly retiring inland, and the country assumes the character of a broad sandy belt, backed by sand ridges for about six miles from the shore, the intermediate space widening gradually to the northward, until at Wanganui the main ridge is about twenty-five miles distant from the sea. In this interval numerous streams flow from the mountains to the sea; some fordable at all times, others occasionally impassable. At *Waikanae* there is a native village where some hundred acres of wheat have been successfully cultivated. Here, too, a native has set up a house of entertainment, with an ordinary on the weekly market days, which is usually well attended. Two pounds of pork, as much of potatoes, and a pint of coffee, with sugar, are furnished to each guest for a shilling. The chapel here is a most creditable specimen of aboriginal architecture and embellishments; the ridge-piece, seventy-six feet in length, was formed out of a single tree, and presented by the people of Otaki, to the people of Waikanae, at the termination of hostilities, in token of peace and goodwill. This and other adjacent villages owe much of their prosperity and happiness to the exertions of the Rev. Octavius Hadfield, of the Church of England Mission. Ten miles to the north of Waikanae is *Otaki*, a thriving village, whose streets have been regularly laid out by a surveyor. The natives have deserted their fortified paha, and built comfortable houses in the middle of their cultivations; the architecture is Maori, but the doors, windows, and other appurtenances, are after the

* *Visitation Tour of 1848*, p. 86.

English fashion. The number of cattle, horses, and pigs feeding around the settlement afford evidence of its prosperity. Power, writing in 1848, says—

"We lunched with E. Martene (Martin) whom we found in a comfortably furnished house, with tables, chairs, knives, and forks, and pictures of the Queen and Prince Albert over the chimney-piece. Martin and his wife were comfortably dressed in European clothing, and they gave us butter, milk, eggs, tea, bread, and cakes, any one of which articles it would have puzzled us to find here a year ago."—(p. 129.)

Bishop Selwyn, on visiting the settlement in the same year, found old Te Rauperaha at the head of about 300 men, engaged in raising, by their own native methods, the heavy pillars for the support of the roof of a chapel 300 feet in length.

Further to the northward, towards *Manawatu*, which is seventeen miles distant, and on the banks of that fine stream, there are several prosperous Maori villages, and scattered European settlers. In the back ground are two fresh-water lakes, one of about two miles, the other (named *Horowenua*), of about five miles in circumference; both drain into small water-courses, and flow into the sea. In the neighbourhood of the Manawatu river and Lake Horowenua, above 300 acre sections have been laid out and selected by Europeans. A recent anonymous writer, (who appears to have been in some manner connected with the New Zealand Company,) says—

"About 150 of the sections in the Manawatu, or eastern district of the two, are in a swamp which will be easily drained, so as to afford the richest soil; and the rest are level forest land, covered with deep vegetable deposits and alluvial soil from the annual freshets. With the exception of a few woody sections, and a few more of reclaimable swamp, the Horowenua district, consisting altogether of 192 sections, spread over open pasture or fern land."—*Handbook of New Zealand*, by a late Magistrate, p. 117.

The above description, evidently penned by a witness disposed to take a favourable view of the capabilities of the district, does not convey an impression of its affording much, if any, land immediately available for agriculture. Thirty miles above the end of the clear navigation of the Manawatu, or eighty-two miles from the sea, by the tortuous course of the stream, but only sixty in a straight line, is the gorge, between the Rua Hine and the Tararua ranges, through which the Manawatu rushes in its progress from the western side of the Rua Hine mountains, where it takes its rise. Small vessels that can cross the bar may ascend the river

thirty-two miles from its mouth, but the tide does not flow for more than two-thirds of the distance; and after heavy floods, the navigation is impeded by large masses of drift timber.

The village and township of *Petre* is situated about four miles up the western bank of the Wanganui river;* the site of the town is level, with the exception of two or three low sandy ridges; and contains 508 sections, of a quarter of an acre each, besides reserves, and a belt for public purposes: the whole plan extends over 807 acres, forming nearly a square, of which two sides are bounded by the river, and a third by a steep, wooded slope, leading up to the high table-land; bold cliffs bound the opposite bank of the river.

A small church, a lock-up house, post-office, and school, constitute the only public buildings of the town, which the author of the *Hand-Book of New Zealand*, writing in 1848, described as containing about thirty houses. There are numerous aboriginal villages bordering the river, and several mission stations. Of these latter, another has been very recently established at Pipiriki, a romantic spot, situated eighty miles from the sea, where the cliffs (200 feet high) tower perpendicularly, like immense bastions, clothed with moss and ivy; in some places tall stemmed trees spring forth from the fissures, in others streams of crystal water flow over them from a great height. A church built here by the Maorics is seventy-five feet long, by thirty-five feet broad, and twenty high, exclusive of the roof.

MIDDLE ISLAND—NEW MUNSTER, OR TAVAI-POENAMMOO.—The physical outline of the Middle Island differs considerably from that of New Ulster: it is of an elongated form, with nearly equal breadth, except to the southward; has few great indentations save those at either extremity; and is characterized by a lofty mountain range, which runs parallel with the west coast. The length of the island in a south-west by south direction is about 500 miles between the parallels of 40° 31' and 46° 35'; the average breadth 120 miles, and the area

* The above details respecting the country between Wellington and Wanganui, have been collated from the accounts given by Bishop Selwyn, the *Hand-book of New Zealand*, by a late magistrate, another later *Hand-book*, by G. B. Earp, Esq., the reports of the Missionary Societies, and some local authorities. Power, who repeatedly traversed the country between Wellington and Wanganui, before

60,000 square miles, or 38,400,000 acres. This estimate is given on the authority of Mr. Frederick Tuckett, whose extensive explorations in the Middle Island, added to the brief, but valuable notices of Cook; the recent nautical surveys of Captain Stokes, the notes of Bishop Selwyn, the "journal" of Mr. Edward Shortland, the results of the long and perilous expedition of Mr. Brunner, the reports of Messrs. Fox, Mantell, and Hamilton, and the recent facts furnished by the colonists themselves, comprise the whole of the information yet acquired of this extensive territory (excepting, of course, the country in the immediate vicinity of Cook Strait).

When the topographical accounts furnished by these authorities materially differ, their respective statements are given, in order that readers or intending emigrants may form their own conclusions. It should, however, be borne in mind, that some years must first elapse, and colonization make considerable progress, before the capabilities of the Middle Island for the support of a large agricultural population, can be satisfactorily ascertained. All that can at present be done, is to indicate the most prominent features of the country; the character of the soil given by surveyors, or other travellers, and the actual capacities of such portions as have been tested by the comparatively few emigrants who have, as yet, established themselves there.

Coast Line.—The southern shores of Cook Strait, unlike the northern coast, afford numerous harbours, and are much broken by spurs, stretching out from the rocky barrier which extends the whole distance behind them, in one great semicircle from *Cape Farewell* their eastern, to *Cape Campbell* their western extremity, and sends forth from its central and highest part the long mountain ridges which divide Massacre Bay and the Takaka on the one side, from the Wairau Valley on the other. *Massacre, or Coal Bay*,† a deep recess containing no good ship harbour, and only a tolerable roadstead, is situated between Cape Farewell, in 40° 3' S. lat., and Separation Point, in 40° 46' S. lat., 173° 5' E. long.

any road was attempted, described the intervening space as 150 miles of forest, swamps, sand-hills, and rivers.—*Sketches in New Zealand*, p. 127.

† The first name, Massacre or Murderer's Bay, was given by Tasman, three of his crew having lost their lives here (see p. 408), the second by the Nelson colonists, from the abundance of coal discovered on its shores.

A point of low land stretches off from the cape, in an east by south direction, and terminates in a long sand-bank, thus barring all entrance to the bay from the north. On and within this bank the water is shoal.

Two rivers, the *Aorere* or *Hauriri*, and the *Takaka* disembogue in Coal Bay, at the entrance of the first of these streams an outer sand-bank affords shelter for small craft: the mouth of the *Takaka*, which is fourteen miles distant to the south-westward, is likewise accessible with the tide to vessels of moderate size. Between the *Takaka* and Separation Point, opposite the village of *Tata*, are two rocky limestone islets, which form the small roadstead above mentioned. Proceeding along shore from the *Takaka* to *Tata*, there is, for a few miles, a frontage of fertile land, backed by lofty and very picturesque crags of white limestone. At the mouth of the *Motu-pipi*, a small stream of three or four miles in length, which originates in the overflowings of the *Takaka*, at a point above a rapid where the river makes a considerable circuit, just above high-water mark, several beds of coal are visible; the limestone rock cropping out close by.*

To the westward of *Tata* is *Tukapa*, or *Toucapo Cove*, from thence the coast is bluff and inaccessible to *Separation Point*, the bold rocky headland, which separates Coal Bay from *Blind Bay*, or *Tasman's Gulf*, a deep bight, whose western shores are generally steep, rocky, and unavailable. There is no limestone at this part of the coast; the rocks are chiefly of whinstone, some sienite, and a crumbling coarse-grained substance, which appears to be an unformed or decomposed granite. *Astrolabe Roadstead*, so named by the French navigator D'Urville, in honour of the corvette which he commanded, is situated in $40^{\circ} 58' \text{ S. lat.}$, $173^{\circ} 6' \text{ E. long.}$ It affords safe anchorage, and is formed by *Adèle Island*, which shelters it on the east. A few miles to the southward are the outlets of the *Rewaka*, a small stream; of the *Motueka*, a considerable river, which flows between mountain ridges, is joined in the early part of its course by the *Motu-pika*, and subsequently receives three or four tributaries; and of the *Moutere*, another small stream.

Proceeding along the southern shore of *Blind Bay*, about ten miles east of the

Moutere, we arrive at the western mouth of the *Waimea River*, and the islands of the same name, to the north-east of which lies the port of the *Nelson Settlement*, a deep tidal harbour, in $41^{\circ} 14' \text{ S. lat.}$, $173^{\circ} 15' \text{ E. long.}$ formed by a narrow bank of very heavy boulders, six miles in length. The tidal stream flowing down the bay, is cleft by a peaked rock called the "Arrow," outside the entrance; part, with a sudden turn northward, rushes into the harbour with the velocity of a mill race, but the main flood passes onward, up the eastern arm of the *Waimea*, which also affords anchorage for vessels. A stream, called by the natives the *Wakatu*, rises in the mountains between the rivers *Waimea* and *Pelorus*, and disembogues in *Nelson Haven*. In this extremity of the bay, wind and rain are both infrequent, and notwithstanding the almost incessant gales which blow one way or the other through Cook Strait, it is usually calm at *Nelson*; but the sea often sets down with a heavy swell from the north and north-east. *

About ten miles from the entrance of *Nelson Haven* is *Pepin Isle*, to the northward of which lies the deep recess, named by the French *Croix Isle*. The shores are steep, and backed by lofty mountains; some small islands at the entrance form a partial breakwater, but a heavy swell enters from the north and north-west, on which account it is not a very eligible harbour. *French Pass*, or *Current Basin*, between D'Urville Island and the main land, extends between *Blind Bay* and *Admiralty Bay*; and, with ordinary care, affords a safe channel for small vessels: large ones ought not to attempt it. The *Astrolabe*, however, succeeded in effecting a passage without receiving serious damage. The shores of *D'Urville's Island* are, for the most part, bold and rocky, and the surface nude, or covered with a stunted vegetation. The southern coast is lower, affords some fertile land, and abounds in beaches and sheltered coves, of easy access to boats. The *Pass* and this shore forms a much-frequented native fishery. On the eastern coast is *Rangitoto*, a considerable native village, situated on a small bay of the same name; and on the northern, in $40^{\circ} 44' \text{ S. lat.}$, $173^{\circ} 57' \text{ E. long.}$, is *Port Hardy*, the best ship harbour in *Blind Bay*.

* This coal is said to be sulphurous, and not very bituminous; it is considered by Mr. Tuckett not good enough for steam-boats, and decidedly unfit for

forge work. It has, however, been of great service in burning the contiguous limestone, and as the vein is worked at a lower level, the quality improves.

Stephens' Islet is separated by a narrow passage from *D'Urville's Island*; it forms the western extremity of *Admiralty Bay*, an opening studded with hilly, wooded islets, among which good anchorage may be obtained. At the southern end of the bay is *Pelorus Sound*, which is about a mile in breadth at its entrance, but immediately expands, and stretches inland for twenty or thirty miles, between wooded ridges, and has thirty to forty fathoms depth of water. Several lesser inlets branch off from the head and sides of the Sound, some of which, from two to three miles broad, are hemmed in by lofty mountains clothed with forests to their summits;—forming altogether a labyrinth of lake-like scenery, of surpassing grandeur. Here and there valleys, or level spots, of very limited extent, are found between the water and the steep hill sides, and serve to add diversity and beauty to the landscape.* The banks of the river are well timbered: they are described by Mr. Tuckett as so rugged, "that it would be difficult to find, on either shore, an extent of level surface sufficient even to admit of pitching a tent. The prevailing rocks are slate; on the east bank, particularly micaceous. Possibly, in the next century, the vine may be cultivated, and the *Pelorus* may be styled hereafter the *Moselle*, or *Rhine* of the *Antipodes*." At the head of the Sound, the *Kaituni*, which flows from the east, and a smaller stream from the neighbouring hills on the west, have their outlets. The islands and rocks on the coast between the *Pelorus* and *Point Jackson*, the north head of *Queen Charlotte's Sound*, are principally of trap and slate. To the west of *Point Jackson* is *Point Gore*, a large open inlet, backed by high, wooded land, which is sometimes used as a harbour of refuge for vessels caught in an adverse gale in the Strait.

Queen Charlotte's Sound is described by Cook as comprising "a collection of the finest harbours in the world." It is about three leagues broad at the entrance, but gradually narrows, and is in many not more than a quarter of a mile broad; its depth continues almost to its head. The regularity of its tides render it as easy of navigation as it is of access: it has deep water close in shore, is perfectly land-locked, and

singularly free from shoals, rocks, sandbanks, or any hidden danger.† Two small islands, called *Long Island* and *Motuara*, lie near the mouth of the Sound. Between the latter and the western shore is *Ship Cove*, an excellent harbour, famous as having been the favourite anchorage of Cook. *West Bay*, a capacious and safe haven, lies to the southward of *Ship Cove*, and several smaller coves indent the western side of the Sound to its termination in a bay called *Anakino*, which receives no river, as the channel of the *Kaituna* (flowing into *Pelorus Sound*) intercepts the drainage from the interior. To the eastward of *Anakino Bay* is a smaller inlet, into which a stream, called the *Waitoa*, about six miles long, descends gently down a narrow, wooded valley, and through a small but fertile flat, from the spot near which the "still waters" of the *Tua Marino* originate, and flow by an equally gradual slope, in an opposite direction, to join the *Wairau*.

The north-western shores of *Queen Charlotte's Sound* are formed by the *Island of Alapawa*, which is about fifteen miles long, and two broad, has a very broken coast line, and is, throughout its extent, extremely hilly, intersected by ravines, and covered with wood. Between this island and the main land, a passage, called *Tory Channel*, connects the Sound, about ten miles above its termination in *Anakino Bay*, with *Cloudy Bay*. The channel, which bears, for the most part, the appearance of a broad river, is generally bordered by mountain ridges, wooded from the water's edge almost to their summits: it has sufficient depth throughout for vessels of the largest size, but its eastern entrance is not more than a quarter of a mile wide, and the tide very rapid, both at ebb and flow.

An extensive harbour, called *East Bay*, is situated on the west coast of *Alapawa*, about six miles south of *Cape Koumaroo*. The north-west shores of this island mark the narrowest portion of *Cook Strait*, at one point only seventeen miles wide. Mr. Anderson, who accompanied Cook in his third voyage, gives the following interesting account of this portion of the coast:—

"The land everywhere about *Queen Charlotte's Sound* is uncommonly mountainous, rising immediately from the sea into large hills with blunted tops.

to the northern, the ebb to the southern head of the Sound: in sailing either in or out with little wind attention must be paid to this. The rise and fall is between seven and eight feet perpendicularly.

* *Handbook*, by a late Magistrate of the Colony, p. 224.

† The only circumstance that makes any particular caution requisite, is the set of the tides—the floods

At considerable distances are valleys, or rather impressions on the sides of the hills which are not deep, each terminating toward the sea in a small cove with a pebbly or sandy beach, behind which are small flats. * * * In every cove a brook of very fine water, in which are some small trout, empties itself into the sea. The base of these mountains, at least towards the shore, consist of a brittle yellowish sandstone, which acquires a bluish cast where the sea washes it. It runs in some places in horizontal, at others in oblique strata, being frequently divided at small distances by thin veins of coarse quartz. * * * The mould or soil which covers this is also of a yellowish cast, not unlike marl, and is usually from one to two or more feet in thickness. * * * The hills (except a few towards the sea, which are covered with bushes) are one continued forest of lofty trees, flourishing with a vigour almost superior to anything that imagination can conceive, and affording an august prospect to those who are delighted with the grand and beautiful works of nature. ⁹—(*Voyage to the Pacific Ocean*, p. 58.)

Port Underwood, in $41^{\circ} 20'$ S. lat., and $174^{\circ} 10'$ E. long., is a magnificent lake-like inlet, surrounded by lofty, forest-clad mountains, situated in the north-western portion of the extensive curve called *Cloudy Bay*. It is about a mile broad at its entrance, and five or six miles in length, widening as it extends inland, and terminating in two small well-sheltered bays, of which the western is divided from Queen Charlotte's Sound by a narrow, hilly isthmus. In the principal harbour there is excellent anchorage; but the south part of it is much exposed to the violent gales which blow in that direction, causing a heavy rolling swell.

The *Wairau River* disembogues to the southward of Port Underwood, after an extensive course through the valley and plain to which it gives its name. The entrance to the river is dangerous, and only accessible in fine weather. Proceeding still in an easterly direction we pass *White Bluff Head*, the termination of a hilly ridge bordering the Wairau—the outlet of a small stream flowing through a plain called the *Kaipara te Hau*, which is practicable for boats with the tide—and arrive at *Cape Campbell*, the headland in which the southern shore of Cook's Strait terminates, and the eastern coast of the Middle Island commences. *Mount Tako*, an eminence of moderate height, rising immediately behind Cape Campbell, is the first of a long series of mountains and hills which continue along the coast, sometimes approaching it very closely.

From Cape Campbell, in $41^{\circ} 40'$ S. lat., $174^{\circ} 27'$ E. long., to *Port Cooper*, in 43° S. lat., 172° E. long., there is no harbour

or sheltered anchorage for ships; about forty miles south of Cape Campbell, is a small mountainous peninsula, named *Kaikura*, which partially shelters a cove called *Lookers-on-Bay*. A little beyond is the embouchure of the *Waiau-ua*, while in the background, clearly visible to vessels sailing along the coast, rise snow-crowned summits of from 4,000 to 5,000 feet in height. The *Hurunui*, a river formed by the confluence of several streams, joins the ocean some five-and-thirty miles to the southward of the *Waiau-ua*; the country through which both these rivers take their course, will be subsequently described. The coast below the mouth of the *Hurunui* forms a deep wide curve, called *Pegasus Bay*, into which several considerable streams disembogue; of these the most important, called the *Wai Makariri*, or *Courtenay*, has its sources in the lofty mountains of the interior, and receives on its left bank the *Eyre*, the *Cust*, and some smaller tributaries; at high water there are two fathoms on the bar at its sea mouth. The native name signifies *furious*, or *very angry*, and well describes the impetuous current of the river when swollen by floods, at other times it flows through a shallow bed, and is easily forded. The southern shore of Pegasus Bay is formed by the oval-shaped, mountainous, and densely-wooded peninsula, to which Cook gave the name of Sir Joseph "Banks." On the northern side of the isthmus, uniting the peninsula with the main land, is the extensive inlet called by the natives *Takalebo*, and by the settlers *Victoria Harbour*, or *Port Cooper*, in $43^{\circ} 36'$ S. lat., $172^{\circ} 45'$ E. long., which extends nine miles from *Godley Head*, the rugged promontory that marks its northern limit; with an average breadth of a mile and-a-half, and a very varying depth. The harbour is easy of access, and has no bar; there are several small coves, but the water in them is shoal. About four miles from the heads on a curve of the northern shore, is the site selected by the Canterbury Association for *Port Lyttelton*; immediately off which, brigs, schooners, and small craft can lie at anchor. The port is nearly surrounded by precipitous hills, twelve to fifteen hundred feet high, over which a road is now being formed to facilitate communication with the extensive tract which has obtained so much celebrity under the denomination of the *Canterbury Plains*. *Port Albert*, or *Levy*, branches off from the same opening in the coast which

forms *Port Victoria*, and extends inland in a southerly direction for about three miles. To the north-west of Port Victoria is a lagoon about three miles in length, connected with the sea by a narrow gut, through which boats pass direct into the channel of a small stream called the *Avon*. *Pigeon Bay*—an inlet of the coast, running in a parallel direction to Port Albert, from which it is only a few miles distant—affords a good haven.

On the opposite shore of the peninsula, at its south-east extremity, is the capacious harbour of *Akaroa*, in $42^{\circ} 54'$ S. lat., $173^{\circ} 1'$ E. long., formerly a favourite resort of French and American whaling ships. It was here that about eighty French settlers established themselves in 1840, under the auspices of a small association called the *Nanto-Bordelaise Company*. [See p. 164–5.]

In the account given by Sir Everard Home, Captain of H.M.S. *North Star*, of his visit to Akaroa harbour, the following particulars are recorded:—

“The entrance may be known by a ledge of large flat black rocks, which lie to the northward. From thence to the anchorage there is a clear passage of about five miles, with a breadth of one to one and-a-half miles, and in one part, about one-third of the way up, the width is not more than three-quarters of a mile. There is no anchorage for the first two miles within the entrance, which is open to seaward with a rocky bottom fifteen to twenty fathoms deep. The tide is scarcely perceptible; the wind blows generally in or out of the harbour, and squalls occasionally blow with violence from the adjacent highlands.”

At the south-west angle of the peninsula is the extensive sheet of water, termed *Lake Ellesmere*, or *Waihora*, separated from the sea by a narrow barren plain, eighteen miles in length, and from ten to thirty feet above its level, which forms the commencement of the continuous range of uniform shingle, called the *Ninety-Mile-Beach*. During the whole of this apparently interminable extent, neither bay or headland (worthy the name) vary the monotonous outline. Numerous rivers, several of which will be noticed in a subsequent page, disembody here, and as far to the southward as Otago; the majority are blocked up at their outlets by a shingle bank, within which the river expands itself into a small fresh-water lake, but a few of the larger ones have an open mouth. They generally follow a strait course, which circumstance, together with the inclination of the plain through which they flow, accounts for their rapid current; their waters are mostly of a

dirty white, or pipe-clay colour. One striking difference distinguishes the rivers originating in the snowy mountains of the interior, from those whose sources are less remote, for whereas in the summer months the former are flooded by the melting snow, and the latter are partially dry; in the winter months the former contain comparatively little water, and the latter overflow the barriers, which at other seasons obstruct their outlets.* At one portion of the coast there is a decided scarcity of water, except in the winter months, for, between the *Rakaia* and the *Wanganui*, a distance of twenty-five miles, there is not any attainable. The former of these rivers is said to have its sources in no less than nine inland lakes. Mr. Shortland, who forded it in the month of January, 1844, describes it as dividing into several branches, the deepest water being scarcely higher than the hips, but so swift that in wading he could feel the shingles moving down the stream. The *Rangitata*, or *Kakitata*, is another rapid stream, flowing into the ocean to the southward of the *Wanganui*; it also takes its rise partly in three lakes, called *Kirioneone*, *Oue*, and *Otamako*, and is subject to floods on the melting of the snow during a north-west wind. The river in the vicinity of the coast runs in three channels, near which a cliff on the northern shore rises about fifty feet. The western mountains appear to be here about thirty miles distant, the intervening space being a level plain, without a tree to be seen on its surface. Beyond the dusky outline of the western range the white tops of a snow-clad ridge appear like distant clouds.†

Immediately beyond *Waitarakao*, the fresh-water lake which marks the termination of the *Ninety-Mile-Beach*, the coast forms somewhat of a headland, and shelters a small roadstead, called *Timaru*. Still proceeding to the southward, towards the parallel of 45° , we reach the mouth of the *Waitaki*, or *Waitangi*, a river which, in times of flood pours into the ocean so vast a body of water, that its stream is perceptible for some miles off the coast. In the winter season the *Waitaki* has been forded, but the hazard is very considerable. There is no permanent bar at its entrance, although such may be temporarily formed during a heavy south-east gale, and Mr. Tuckett

* *Southern Districts of New Zealand*, by Edward Shortland, M.A., 1851. Pp. 241, 242.

† Shortland, p. 260.

considers it practicable for an ocean steamer with the tide. The North Head is high and clifty, the south low, with a shingle bank on it.

Moeraki, or *Moerangi Bay*, is in lat. $45^{\circ} 30'$, with cliffs twenty to fifty feet high: a conspicuous reef, lies about a mile from the shore, and acts as a breakwater against the swell from the south-east, forming a roadstead in which a vessel might ordinarily ride at anchor, or quit readily, if requisite, with the wind from the north-east. A whaling station has long been established here, and a small port for vessels of fifty tons might be formed at comparatively little expense. Opposite the reef is a native village, which gives its name to the bay.

The next headland is called by the natives *Womroa*. Farther to the south at *Matakaea*, there is a bed of coal visible in the rocky cliff, which can be approached by boats through a narrow entrance between the outlying submerged rocks. Tracing the sea coast-line towards Otago, we find the *Wai-imu*, or *Waihemo River*, a clear, still piece of water, bayed back inland by a bad bar; it may, however, be entered by large boats or barges, and flows through a very beautiful and fertile valley. The hill land between it and the next declivity, which is named "Pleasant Valley," is almost equally good. A few miles further south, is *Waikouaiti River* and whaling station, which, with the aid of a short projecting pier from the northern headland, would furnish a tolerable harbour for small craft. From Waikouaiti to Otago, a distance of about nine miles, a bay extends, in whose south-west angle is a small but available harbour, called *Purakounui*, which offers a very eligible site for a village to husbandmen as well as fishermen, as there is good pasture and bush-land, well watered, adjacent to it.

Otago, or *Otakou*, the next harbour to Akaroa in a southerly direction, from which it is about 200 miles distant, is formed by a triangular-shaped peninsula, terminating in *Cape Saunders*, in lat. $45^{\circ} 53'$; long. $170^{\circ} 50'$: it is about fourteen miles long by two miles broad, with a depth of six fathoms, the whole way to Port Chalmers, the anchorage for large ships. At the seaward entrance, there is a bar with three fathoms on it at low tide, which is not more than 120 yards wide, and may therefore be scooped away by a steam dredge, whenever the trade of the port will bear the expense.

The channel up to Port Chalmers, half-way from the head to the top of the haven, though deep, is narrow and winding; the depth of water from thence to *Dunedin*, the new Scottish settlement, is only sufficient for boats. A narrow and low bank of sand, across which boats may be conveyed, separates *Dunedin*, and the estuary on which it is situated, from the ocean. This bank is swampy, and covered with high grass.

The whole harbour, from the Heads to *Dunedin* (fourteen miles,) is bounded on each side by a succession of headlands, projecting a little way into the water, and forming little bays, with beaches of hard, dry sand. The headlands rise at once to a height of from three hundred to four or five thousand feet, and are wooded from the water's edge to their very summits. This ridge and some lesser hills separate *Dunedin* from the *Taiari Plains*.

Port Chalmers, or *Koputai* is a peninsula-formed bay, along whose shores a town has been established, which already promises to rival *Dunedin*. Ships of any tonnage can anchor within a short distance of the town, perfectly sheltered from the strongest winds, and uninfluenced by the tides. The depth of water is sufficient to allow coasters to heave down at high-water mark, for repairs. *Deborah Bay*, opposite Port Chalmers, is a pretty spot.

South-west of Cape Saunders is a lofty-peaked, rocky islet, named *St. Michael's Mount*, and on shore, some distance inland, is a conspicuous elevation, called *Saddleback Hill*. Two small streams, the *Kaikarai* and *Otokia*, disembody on the coast between these two points; the former flowing from the northward, and the latter from the westward. To the southward of *Saddleback Hill* is the entrance of the *Taiari River*, which has a wild and inhospitable appearance, being almost blocked up by shoals and breakers. A rocky islet at the mouth is occupied as a whaling station. Schooners, by means of the tide, can cross the bar, within which there is deep, navigable fresh water for some miles inland. A few miles from *Taiari* is a tidal haven, accessible to large boats; but the coast is very rude and inhospitable down to the river, the *Tokomariro*, a stream of some extent, but completely barred at its entrance from seaward by a sand-bank: cliffs, fifty feet high, extend from thence along the coast, as far as the *Molyneux*, or *Matau River*. Several islets lie a mile or two off the shore,

between Taieri and Tokomariro, three of which are named *Matukatu*, *Hakanini*, and *Anui*.

About midway between Tokomariro and Molyneux rivers there is visible, on the coast, a cliff of coal, about a furlong in length, and upwards of twenty feet in vertical section. Mr. Tuckett considers this the best coal found by him in New Zealand, and has no doubt of its being an extensive coal field, as it reappears inland, on the banks of the Molyneux. The land above the coal, and adjacent to it, is particularly good.

The Molyneux river has two and-a-half fathoms on its sea bar, within which there are six fathoms of clear fresh water, communicating with a tract of fine land in the interior. The stream has been explored for 100 miles inland, and is, in some places, half a mile broad. Near its sea-mouth it receives the *Puerua River*, and has a northerly course, parallel to the shore, for about five miles, when it divides into two branches, forming an island about ten miles in length, and two in breadth. When the branches reunite, the river has a north-westerly, and subsequently a northerly course. The *Korero River* disembogues midway between the Molyneux and Tokato Point, from whence a range of lofty hills stretch inland.

At *Tokato Point*, off which there are some rocks, called by the whalers the *Naggets*, in lat. $46^{\circ} 30'$, long. $169^{\circ} 57'$, a vessel may lie while the wind is southerly. On the opposite side, an inlet in the lofty rocks of the coast, with a small river (the *Owaka*), affords shelter for schooners. Coal can also be obtained here. In this neighbourhood, the low cliffs and open pasture country cease; and from hence to the *Waikawa Haven and River*, the coast becomes extremely bold; lofty rocks, often of basalt, alternating with steep, wooded heights.

Tautuku Bay is commodious and picturesque, with good land, on which several whalers are located; and, united with Maori women, have expended much labour in clearing and tilling the soil. They possess a large stock of geese, ducks, and fowls; and on an island off the north-east headland there is a prolific rabbit warren.

A rocky headland, called *Chasland's Mistake*, and two lofty islets, named the *Brothers*, lead us to *Waikawa (Success)* river and harbour, about twenty-eight miles south of Tokato Point. The haven is second-rate, very narrow, and not easily distin-

guishable; the inner shore is a low beach, and the outer a lofty, precipitous headland. A large rock outside the entrance, on which the waves dash furiously, looks like the end of a submerged reef, and may deter the navigator; but the danger is more apparent than real, and a vessel of 300 tons may pass on either side. As at Port Nelson, the tide carries a vessel swiftly into the port, which opens into a somewhat narrow basin, running several miles inland to the north-west, and completely enclosed within lofty, wooded hills. The river enters the head of the harbour from a narrow and thickly-wooded valley, but the navigation is soon impeded by rapids and falls. The land does not appear so fertile as at *Tautuku*; basaltic rocks are not visible, but chiefly a soft iron and ochre-stained grit.

On approaching the *Mataura River*, the hilly, wooded land, and bluff coast terminates; the shore trends to the westward; and a level, open country reappears, which extends about twenty miles towards *Bluff Harbour*, and inland, in a north-west direction, for about fifty miles, to the *Aparima River*. *Tuturau*, a good fishery and a favourite native residence, is situated on the *Mataura*, twenty-five miles from its mouth.

Near the shore of *Bluff Harbour* the ocean-waves break on a high beach of fine quartz gravel, and from thence inland to the *Waiopai* the prevailing composition of the country is the same. The vegetation is chiefly of low shrubs, heather, and deep beds of moss. Numerous streams intersect it, and disembogue between the *Mataura* and the *Bluff*: deep peat occurs in several parts of this tract.

The following account of that portion of the southern shores of the Middle Island which forms the northern boundary of *Foveaux Strait*, is compiled from data furnished by Mr. Tuckett. *Stewart*, or *South Island*, will be subsequently described:—

"Bluff Harbour is a capacious basin, and has a good entrance accessible by two channels, one from the east along shore, and the other from the south. A large permanent bank, outside the entrance, is the cause of the diverging channels. Within, the tide extends for several miles to the north-east, and the sudden reflux of such an extent of shoal water effectually clears the entrance. There is no deep water in the harbour, excepting along the opposite, or south-western shore. The land north-east is low and flat, but the peninsula on the south-west is high and bold, especially on the outer face, sloping down to the water's edge inside the harbour, and affording a limited extent of fertile bush land and excellent timber.

"The same peninsula which forms *Bluff Harbour*

to the westward, shelters to the eastward the embouchure of the river *Eurete*, *Omaui*, or *New River*, where ships can enter and anchor in safety. Between it and the western extremity of Bluff Harbour, a narrow tract of low land intervenes, on which, at seasons of high tides and copious rains, the waters have already traced the line of lowest level.

"A little inland of the anchorage, the *Eurete* makes a considerable bend to the north-west; here the *Waiopai*, coming from the north-east, unites with it. The latter not having a mountain source is comparatively sluggish, and can be easily ascended, but against the former stream it is difficult, even with a whale boat and a whaling crew, to make much way beyond the influence of the flowing tide. The 'totara' abounds on the sandy banks of the *Eurete*, from whose entrance to that of *Aparima* or *Jacob's River*, the water is very shoal, and the shore an extensive sand-bank; towards the *Aparima* the surface becomes firmer and is covered with grass growing in small tufts as on the plain near Port Cooper. Behind the sandy frontage, there is a great extent of table land of gentle elevation and promising appearance. Small detached woods, chiefly of birch, form pleasing and park-like landscapes. The unwooded surface, however, is almost nude; it consists of a deep, whitish calcareous grit earth, and produces only bunches of the toi-toi (or tohi-tohi), and other coarse grass and junci. Tall *Manuka* and small birch are the principal growth on the western bank of the *Aparima*, which, as it is ascended, becomes steep and stony. From the estuary of this river an arm named *Purupuruke*, uninfluenced by the tide, diverges to the eastward, from whose extremity to the river *Eurete* a short canal might easily be constructed, which would connect the navigation of the two rivers—a necessary preliminary work, in the event of the climate and soil proving sufficiently favourable to render the district an eligible site for colonization."

On the coast to the westward of the *Aparima* basaltic rocks again occur, and the country, though hilly, broken, and difficult of access, is more fertile; passing a small but deep inlet called *Colack Bay*, and the rocky islets of the same name, we arrive at a wider curve, in the centre of which a stream called *Te Wai-wai* disembogues, to the westward of which a long beach extends, backed by white cliffs, and broken only by the outlet of the *Waiiau*, a stream flowing in a southerly direction from an inland lake called *Te Anau*.

The south-west extremity of the island, between 46° and $45^{\circ} 30'$ S. lat., presents a striking assemblage of islands and inlets, forming in this limited space numerous deep-water havens. The first or most southerly of these, *Port Preservation*, which was formerly considered a very good whaling-station, may be said to be an arm of *Chalky Bay*, to the northward of which is *West Cape*, in $45^{\circ} 56'$ S. lat., $166^{\circ} 18'$ E. long. *Dusky Bay* lies about nine miles further to the northward; it has an entrance three or four miles broad, and con-

tains several islets, behind which there is shelter from all winds. Its northern shores are formed by *Resolution Island*, from which stretches a long tongue of land, called by Cook, *Point Five Fingers*, on account of five high-peaked rocks which lie off it. The land on the point is lofty, level, and wooded, forming an exception to the general character of the country for a considerable distance around; this latter being barren, rocky, and mountainous.* No Europeans are now stationed in this neighbourhood, neither are there any native settlements from the West Cape to nearly 43° of latitude; but there are said to be a few bush or wild natives, the small remainder of the former possessors of the soil, who have escaped the more general doom of death or slavery. *Doubtful*, or *Gaol Harbour*, is in $45^{\circ} 15'$ S. lat., from thence to *Milford Haven*, in $44^{\circ} 32'$ S. lat., mountain masses abut on the coast, giving it a dreary and inaccessible appearance. The sea is of great depth near the shore, and bays or serratures like the fiords of Norway are frequent.

Milford Haven is large and commodious, but there is no available land on its shores. To the northward is the mouth of a broad river called the *Awarua*, or *Arahua*, whose channel extends towards the extensive inland lakes, where the *Poenammoo* or green talc is obtained.

Cascade Point, in $43^{\circ} 55'$ S. lat., derives its name from four small streams which fall down its high red cliffs; it is the termination of a promontory whose northern shores shelter a recess called *Jackson's Bay*, off which lies a small island. Sealers, to whom every boat harbour on these shores is familiar, report that there is here a considerable tract of very fertile land, with a warm climate and good fishing. Mr. Tuckett was informed by several of the most intelligent of this class of men, that in every respect, save the absence of a real harbour, it was admirably adapted for the requirements of colonization; and their accounts all agreed in asserting it to be the only tract on the whole western coast, adequate for the requirements of a British settlement.

Titihiaia Headland is interesting as the furthest point reached on the 19th of November, 1847, by Mr. Brunner, an enterprising and most zealous surveyor, who penetrated on foot from Nelson to the

* *Cook's First Voyage Round the World*, p. 179.

Kawatiri, or *Buller River*, in $41^{\circ} 46'$ S. lat., and from thence traversed the coast as far as *Titihia*,* in about $43^{\circ} 38'$ S. lat.

The following facts respecting the portion of the coast which still remains to be described, are gleaned from Mr. Brunner's valuable report (Parliamentary Papers, New Zealand, 1850; pp. 31 to 56.):—

Twenty miles beyond *Titihia* is a low rocky point named *Kohai-hai* which forms the northern headland of a curve called *Looking-Glass* or *Narrow Bay*, into which two streams descend; the larger of these, named the *Waiweka*, was crossed by Mr. Brunner on a raft, and is described by him as a very dangerous stream flowing from the mountains over a rocky bed. Some miles to the northward is the *Waihu*, a large mountain-rapid running over a broad granite bed, and fifteen miles further is *Okaritu*, the most southerly of the native villages on this coast. Ten miles north of *Okaritu* is the mouth of the *Wairoa*, a mountain torrent falling over a large bed of granite rocks; between these two points there is no level land, the snow-capped range descending to the coast. Still proceeding in the same direction, and passing a long range of cliffs surmounted and surrounded by a dense mass of forest, we arrive at a strong running stream, about 150 yards wide, noted for a pond on its banks abounding in eels of a fine quality; a little beyond is a pretty river named the *Wanganui*, flowing in a wooded valley with but little level land. A stream about half a mile wide intervenes between the *Wanganui* and a projecting headland called *Paramata* or *Bold Head*, where Mr. Brunner found a stratum of fine-grained slate, having a good cleavage and of a reddish-brown colour, under a kind of blue clay. Between *Paramata*, and the *Okitika*, a considerable river about sixteen miles distant, the country is level and densely wooded. On the banks of the river there is some good bush land and deserted 'tara' plantations. The natives who formerly resided here, have gone further north, the bar at the mouth of the river having become so dangerous as to prevent their continuing the hapuka fishery, which formerly rendered the place so valuable to them [the hapuka being the best and heaviest fish found in New Zealand]. Mr. Brunner states that the encroachment of the sea on the land has created this obstacle, and mentions elsewhere several indications of a similar encroachment.

The *Okitika* rises in a lofty snow-capped mountain, considerably higher than the main range of which it forms part. This peak, called by the natives

* But for an unfortunate accident, by which his foot and ankle were severely injured, this enterprising and courageous explorer, would (though without aid from the colony, and subsisting precariously, from day to day, on such food as could be procured by the way) have proceeded south of *Titihia* to *Jackson Bay*, and ascertained beyond a question the real character of that part of the country.

When only a short distance to the north of the spot where this unlooked for calamity frustrated the execution of his project—he had thus recorded in his journal his confidence in his increased capability to endure and surmount the difficulties of his path—"I believe I have now acquired the two greatest requisites for bushmen in New Zealand, viz., the

Kaimatua, is visible from Port Cooper on the eastern coast; a branch diverges from it towards the westward, and terminates in the before-mentioned promontory of *Paramata*. The rivers *Arahura* or *Brunner* and the *Tera Makau* also originate in the northern slopes of the *Kaimatua*, and flow into the ocean to the northward of the *Okitika*.

To the northward of *Tera Makau* is the *Mawhera* or *Grey*, a clear deep river, (with a bar at its mouth, the depth of water on which Mr. Brunner does not state,) running over a bright shingle bed; the undergrowth on its immediate banks is a beautiful mixture of shrubs, and the adjoining bush fine lofty rimu, rata, and black birch, with scattered patches of fern land. Its delta is described as a recess in the Alps of New Zealand, affording with the *Teramakino* valley (which is separated from it only by hills of gentle elevation), a considerable extent of available country. About six miles up the river is a seam of coal of apparently very fine quality, which presents itself under a stratum of mica slate. The coal is hard and brittle, very bright and sparkling, burns freely, and is free from smell; the seam is some feet deep, and level with the river's edge, but at least fifty feet below the surface of the earth. At a point about three or four miles further up, the river divides itself into two streams—the right-hand and smaller branch, called *Kotu-urakaoka*, bearing about south-east, and leading to a pass to the east coast, almost at right angles to the main stream. This branch of the river is wooded, but has a considerable belt of level land. [The *Kotu-urakaoka* takes its rise in a lake, of which some description will be given in speaking of the promising district connected with the *Grey* and its tributaries.] From the mouth of the *Mawhera* to *Cape Farewell*, the northern extremity of the *Middle Island*, a range of mountains runs parallel to the coast, sending down to the sea spurs or lateral forest-ridges, terminating in cliffs and headlands more or less bold and precipitous, the valleys or ravines between each of these contributing a stream more or less considerable, fed by the snows of the central chain and the drainage of its sides. 'In walking, therefore, along the coast between these points,' says Mr. Brunner, 'you have frequently to clamber over a rocky promontory jutting out into the sea, or, where this is impossible, to take advantage of the receding tide to pass round its base, strewn with the granite fragments which have been detached by the action of the water; and, having toiled among the broken rocks for a greater or less number of miles, you again come to another stretch of sandy beach, another river to be forded, and another precipice to try the goodness of your footing and your nerves.'

capability of walking barefoot, and the proper method of cooking and eating fern root. I had often looked forward with dread to the time when my shoes would be worn out, often fearing I should be left a barefooted cripple in some desolate black birch forest, or on this deserted coast; but now I can trudge along merrily barefoot, or with a pair of native sandals, called by the natives *pairairai*, made of the leaves of the flax, and what is more durable, the leaves of the ti, or flax, tree. I can make a sure footing in crossing rivers and ascending or descending precipices; in fact I feel, I am just beginning to make exploring easy work. A good pair of sandals will last about two day's hard work, and they take only about twenty minutes to make."

The only interruption to this occurs on the banks of the *Kawatiri* or *Buller River*, which enters the sea near the southern extremity of the wide curve extending between *Cape Foulwind*, in $41^{\circ} 46'$ S. lat., $171^{\circ} 29'$ E. long., and *Rocky Point*, a prominent headland in $40^{\circ} 54'$ S. lat., $172^{\circ} 10'$ E. long. The *Kawatiri* is a great river flowing from two mountain lakes called the *Roturoa* and *Rotuiti*, which lie inland nearly due east, the furthest being about seventy miles distant, and about sixty miles south-west by south from the town of Nelson. The *Inakaiona*, with its numerous mountain tributaries, joins it from the south-eastward.

But one more feature requires notice before closing our brief examination of the coast-line, commenced at Cape Farewell, viz., *Wanganui Haven*, which lies immediately to the southward of that point, and has a straight entrance between very bold headlands, leading to a tidal basin eleven miles in length, running parallel with the coast. The northern portion has deep water; that to the southward is shoal; on the western side four seams of coal are visible in the cliffs at low water; the highest of these is about fourteen inches thick, of inferior quality; the second and third, four inches, and the fourth ten inches thick, all of good quality. The adjacent rocks are of a soft grit, similar to that seen at Newcastle (England), but inferior in compactness and sharpness, and very much streaked on the surface by numerous small veins of iron ore. Should this prove an extensive coal-field, the harbour would require surveying, as there is a reef outside the entrance on which the white water looks dangerous; it is, however, believed that a ship may safely enter at near high water.

MOUNTAINS.—An immense mountain chain ranges the entire length of the island, running parallel with the western coast, and having the greatest elevation from 42° of latitude to the northward, and from 45° of latitude to the southward. The mean height of the entire range is supposed to be about 8,000 feet, but some summits are said to exceed 12,000 feet in altitude. Among the loftiest peaks may be noticed a snow-clad ridge, situated in 40° lat. a little south of the lakes *Rotuiti* and *Roturoa*, a position nearly equidistant from the eastern and western coasts.

Numerous branches diverge from the great chain; of these one already mentioned extends northward to the head water of Queen Charlotte's Sound, separating the valleys of the *Wairau* and *Oyerri*; an

eastern divergence has its northern extremity terminating on the coast at *Kai-kúra*, and more towards the centre of the island a series of minor ridges, with numerous spurs and buttresses, rise behind the Canterbury Plain, and then, taking a south-easterly direction, gradually approach the coast in the vicinity of Moerangi and Otago, to the very verge of the ocean. With the exception of a few small plains and narrow valleys, the whole country north of the forty-second parallel is an extremely rugged and inaccessible region; it is thus truly described by Cook, as seen by him at sea off the western coast:—"There is a narrow ridge of hills that rises directly from the sea, and is covered with wood; close behind are the mountains extending in a ridge of stupendous height, and consisting of rocks that are totally barren and naked, except where they are covered with snow, which has probably lain there ever since the creation of the world. A prospect more rude, craggy, and desolate than this country affords, cannot possibly be conceived—for as far inland as the eye can reach, nothing appears but the summits of rocks, which stand so near together, that instead of valleys there are only fissures between them."

RIVERS AND LAKES.—The rivers in the Middle as in the North Island of New Zealand, flow uniformly from the interior to the sea coast; the most important have consequently been already mentioned, and the little which remains to be said of them, will be related in describing the character of the country in which they are situated. Many take their rise in inland lakes. Of these latter, some few in the northern portion of the island have been visited by Europeans, but respecting those in the central and southern regions of the uninhabited and almost inaccessible interior, where they are said to be far more numerous and extensive, we have no other knowledge than the vague traditional reports current among the natives.

SETTLEMENTS OF THE MIDDLE ISLAND.—*Nelson, and the adjacent Country.*—The town of Nelson is situated at the south-east extremity of Blind Bay, in $41^{\circ} 15'$ S. lat., $173^{\circ} 16'$ E. long., on a small flat at the head of a haven hemmed in by rugged hills, and incapable of holding vessels of above five or six hundred tons,* but with a

* Strenuous endeavours are being made to improve the harbour, and it appears by the latest Colonial newspapers that 150 feet of rock in the entrance

have been shattered and partly removed, which is nearly one-half of what is sought to be achieved.—*New Zealand Spectator*, July 13th, 1851.

good roadstead outside the bar. This position, the most unfortunate that could well have been selected for the site of an extensive agricultural settlement, was chosen by the New Zealand Company, probably with the motive of benefitting Wellington, their "first and principal settlement," which was then on the very verge of ruin.

Mr. Tuckett, the chief surveyor to whom the selection had been nominally confided, found himself, on arriving in New Zealand, utterly powerless to prevent Captain Wakefield, R.N., (the local agent,) from fixing the site in so manifestly ineligible a locality, and, in despite of his remonstrances, the three shiploads of emigrants who had already arrived, and who were speedily followed by the remainder of the deluded body, despatched by the New Zealand Company with their usual precipitancy, were landed, and the formation of the town commenced forthwith.—(*Vide* p. 180.) Instead of having in and around Nelson at least a quarter of a million acres good land, the whole of the shores of Blind Bay do not contain more than 50,000 acres of level surface, and of these not half is cultivable.* But for the characteristic perseverance and energy of the settlers, the place, notwithstanding the deceptive reports and fallacious promises made by the Company and their agents, must have been abandoned; as it is, it cannot be regarded as otherwise than a complete failure, both as a colony and as an agricultural settlement—while the "town," after the lapse of ten years, is little more than a straggling village, although nominally comprising a space of 1,100 acres. Of the emigrants originally introduced, a large proportion have re-emigrated; fled from the scene of bitter disappointment, which had been described to them as a paradise, and it has only been by the remainder devoting their time and means to the rearing of cattle and sheep, that they have been saved from utter destruction.

The town has been as well planned as circumstances would permit, but there are no public or private buildings requiring notice. In the centre of it, a square, called Trafalgar, has been laid out, in the middle of which, about forty feet above the surrounding streets, an Episcopal church, constructed of wood, in the form of a cross, has been recently erected in place of the temporary building previously used for the

* A coloured map admirably illustrating the physical features of the country surveyed to form the

celebration of divine worship. The Wesleyans have a neat brick chapel. There is a literary institution, with a small library, an agricultural and horticultural society, and a printing-press and newspaper. There are three or four flour, saw, and flax mills, a brewery, six public-houses, and an inn, called an "hotel." Nelson has no municipal institutions, having in fact no civic community to carry them into effect. A magistrate and a collector of customs, appointed by the Governor-in-chief, form the whole government staff. Many of the proprietors of land in the settlement are absentees, the higher class of *non-absentee* proprietors (for *resident* they cannot properly be termed) are stock-holders and squatters, scattered over several districts, and the chief number of actual inhabitants are composed of the very men who, according to the so-called "Wakefield policy," were never to have emerged from the condition of hired labourers, but who now, owing to the complete breaking up of the whole scheme, have, after undergoing most severe hardships (*vide* p. 241), become cottiers, and are now engaged in cultivating the land for themselves and for their families. Squatters, cottiers, and waste land at thirty shillings an acre; what an immense sacrifice must not the original purchasers have incurred to bring about this result! The population of the settlement in 1843 was 1,568 males, 1,354 females = 2,922; and in 1848, 1,657 males, 1,433 females = 3,090,—increase in five years, only 168 souls.

The nearest available land to Nelson of any extent, is that comprised in the *Waimea Plain*, which was discovered and explored by Mr. Tuckett in 1841. It affords about 40,000 acres of level land, about half of which is worth cultivating, and some portions very good. That which was under water at the time it was surveyed, proved the most profitable when the sections had been properly drained. In a hill east of the Waimea, at about 200 feet elevation, is found marine limestone of excellent quality. Some portion of it is a conglomerate of shells. The country to the westward is thus described by Mr. Tuckett—

"Between the Waimea and a small stream called the Moutere is a considerable table land of moderate elevation and gently undulating surface. The soil is an impervious cake of an iron and ochreous stained gritty clay, which produces only a stunted growth of manuka, fern, and rushes, being available in point of settlement of Nelson, was given in Sidney's *Emigrant Journal* for 1849. Published by Messrs. Orr and Co.

level, for want of better land, it has been subdivided into sections, but it is quite worthless. Inland it is bounded by a valley, about nine miles in length and two in breadth, which runs parallel with the coast, crossing from the western ridge of the Waimea to the eastern of the Motueka. It is called the Moutere Valley, it has for the most part a thick growth of tall forest trees, but wherever it has been cleared it has disappointed the cultivator, who digs or ploughs in a deep gritty white coloured clay, from which rains and floods have washed all the soluble earth.

"In the vicinity of the Motueka River, adjacent to the coast, about 6,000 acres of good land have been obtained, of which about half is of excellent quality. The unwooded portion of the plain between the Motueka and Moutere is much of it very stony, and the unwooded part of the same plain between the Motueka and the Rewaka, is mostly wet and swampy. About 120 adult natives reside at the Motueka, and cultivate land extensively.

"The north-west shores of Blind Bay are steep, rocky, and unavailable; on this account, no land has been surveyed for occupation or even for sale, between Astrolabe Roads and Separation Point.

"Near the mouth of the Takaka, in Massacre Bay, there is some fertile land, but on being ascended for a few miles, the channel is found to contract suddenly, the land consists more largely of river-sand and stone, and is liable to frequent floods, which wash away all soluble or light deposits. Coal is visible in several places in a north-west and south-east direction. A reddish marble is visible in a cliff called Rangitata, near the mouth of the river, and large masses of white quartz are observable in various places. Between the mouth of the Takaka and the Aorere, or Hauriri, fifteen miles to the westward, there is a considerable tract of land of very moderate elevation, but with the exception of one block, not exceeding 200 acres, it is of little value. Its composition is, however, remarkable. A very level surface, covered for the most part with dwarfed rushes growing out, deep, white coarse-grained sand, resembling crushed quartz and oolite, and sodden with water.

"The Aorere valley is heavily timbered, but the river descending rapidly from the neighbouring mountains, frequently lays a considerable portion of it under water. The beautiful tree-ferns, one variety of which (the mamakou) is edible, abound in this valley. They flourish in moist and shady places, as does also a cabbage-palm—but this latter is more rare. There is a native village at the mouth of the Aorere. Along the northern shore of Massacre Bay there is a narrow frontage of available land at the foot of the hills. There are three native villages; about the centre, at Pakouwau, a native path passes over the hills to Wanganui, on the west coast; on the track behind Pakouwau, about a mile and-a-half from the shore, at an elevation of four or five hundred feet, a seam of coal is visible in the bed of a rivulet; this coal is hard and lustrous in fracture, of good quality, and has been used for forge work."

To the north-east of the town of Nelson, with the exception of a narrow strip extending along shore about three miles from Pepin Isle, the intractable nature of the district has forbidden any attempt at occupation. There is a flax swamp at the

termination of the surveyed land of about 1,200 acres in extent, which when drained will be valuable for cultivation.

Some so-called roads have been formed or attempted in the immediate vicinity of Nelson; one from the town to beyond the village of Wakefield, in the Glen-iti valley, is twenty-one miles in extent, and has eight miles of cross-roads. Ten miles of road-way have been opened from Waimea to Motueka; three miles from Motueka to Rewaka, and nine miles from Wakapuaka to the Happy Valley. Most of these are not passable in the winter months. From three to four miles have been opened about Nelson; viz., to Brook Street Valley one mile, Haven Road one and a half mile, up the Matua Valley nearly a mile. The greatest amount of cultivation is in the Waimea Plain, but the whole extent under tillage does not amount to 1,500 acres.

The climate of Nelson is peculiar,—unlike Wellington, where wind and rain are among the chief sources of discomfort, the former is here rarely tempestuous and the latter not frequent enough, that is, on the low land surveyed for occupation adjacent to the coast. There is more than enough in the mountains near at hand, as is usual in other parts of New Zealand. The sky is rarely overcast, and the sunshine is bright and hot in winter as well as in summer, but in the shade the air is always cool even in summer. For the same reason, (the contiguity of snowy mountains), the spring climate is harsh and ungenial, checking vegetation, but the autumn and winter climate is very mild and constant.

To the eastward of Nelson, near the head of Queen Charlotte's Sound, there is a small extent of excellent land and also some very fine timber. From hence, by means of the narrow valley of the Waitoi River, a road might be made to the extensive Wairau District; a broad level plain, eight or ten miles wide, which forms the low western shores of Cloudy Bay, runs inland for eighteen miles, and then suddenly converging to a width of about two miles, extends from forty to fifty miles inland. Though apparently quite flat, there is really a considerable fall from the head of the valley to the sea. According to Mr. Fox, the land for four or five miles from the sea is generally swampy, but of easy drainage; for the next eight or ten miles it is dry, covered with long grass and generally of good quality; beyond this it continues getting

lighter till it becomes very poor and stony, and only fit for grazing purposes.

The hills on the west side of the Wairau are mostly wooded, on the plain itself there is only one small tract of forest. The eastern portion of the plain is closely covered with grass, and affords good pasture for sheep, as do also the slopes of the boundary hills, which divide it from a smaller plain, called *Kaipara te Hau*. This latter tract is wholly unwooded, neither is there any timber visible from it: the high land bordering it to the southward and stretching to the eastern coast, is grassy, and affords better pasture than the plain itself, which is for the most part arid and stony.

A town in connexion with the Wairau and Kaipara te Hau plains will probably be eventually formed at Port Underwood, whose shores, however, scarcely afford as much level land as could be desired for the purpose. There is now a native village near the head of the harbour, where a Wesleyan missionary resides. Unfortunately for Nelson a heavy mountain ridge, unbroken except in three places, divides Blind Bay from the Wairau; the only pass at present practicable for horses or live stock is fifty miles south of Nelson, and enters the upper part of the Wairau Valley at a point sixty miles from Cloudy Bay, making the whole distance from bay to bay 110 miles.

It is said, however, that there is another pass, which, by a moderate amount of engineering skill and expenditure, might be made available, and would bring the Wairau Plain within thirty miles of Nelson. This route lies through the mountains, a mile north of Nelson by the Maitai river, which flows through the town, crosses the upper part of the Pelorus or Oyerri, and enters the Wairau by the Kaituna Valley, about fifteen miles from the sea.—(*Vide* Report on the Nelson Settlement. 1848. W. Fox, Esq., p. 10.)

The country forming the back-ground of that extending along the shores of Massacre Bay, is a vast mountainous tract, utterly unfit either for tillage or pasture, stretching as far southward as the valley of the *Kawatiri* or *Buller*, an extensive river, recently traced by Mr. Brunner from its sources to its outlet, with a very unsatisfactory result. The whole of the northern bank is declared by its adventurous explorer to be—

“Perfectly valueless, bearing mostly black birch

and very steep. There appear no indications of coal, slate, or any metals, the chief formation of the country being coarse granite rock. The opposite bank seemed to contain pine trees in many places, and to have large flats of level timbered land; but the valley of the *Inakaiona* is the only open country of any extent on the banks of the *Kawatiri* from the *Matukituki* to its embouchure. * * * I was much disappointed in the last eight or ten miles of this river. I had previously seen the land from the coast, and thought it good and richly wooded where, on inspection, I found a wet, mossy surface, with little, if any, vegetable soil, the growth being chiefly rata. It will certainly not be in my time that the banks of the *Kawatiri* will be cultivated by a white population.”

The *Matukituki* valley, through which the *Kawatiri* flows on emerging from the rocky gorges by which it is encompassed up to this point, is formed by the receding of the mountains; two other valleys open into it, both contributing their stream to swell its waters—the *Matiri*, from the northward, and the *Tutaki*, from the southward. A ridge of hills separates the latter valley from that of the *Tiraumea*. Beyond the *Matukituki* the river passes seaward through a “frightful country;” and Mr. Brunner speaks of the continual heavy rains, which increased the combination of difficulties formed by “large granite rocks, heaped confusedly together on the surface, with a thick growth of underbrush and briars, an immense quantity of dead and rotten timber, and all these on the steep and broken declivities of a range of high mountains, interspersed with perpendicular walls of rocks, precipices, and deep ravines.”

Lakes *Roturoa* and *Rotu-iti*—from whence the streams flow, which, uniting form the *Kawatiri*—are about six miles apart, the former is entirely surrounded by a chain of snow-clad mountains; near the latter there is some pasture; but Mr. Brunner considers the *Rotu-iti* valley too cold and open for a sheep-run, and the grass much inferior to that found on the Wairau Plain.

The valley of the *Inakaiona*, or *Oweka River*, extends southward of the *Kawatiri* to the *Mawhera* or *Grey River*, and is a tract of level country, sixty miles long, by four or five miles broad, separated from the sea by the coast range, and hemmed in to the eastward by the interior mountains. Mr. Brunner notes in his journal having passed through tracts of fine, rich land in this valley; but he gives no estimate of their area. On approaching the *Mawhera*, or *Grey River*, the aspect of the country changes—the hills diminish in height, gradually sinking into an open and level, or

gently undulating country, with a coast line of about forty miles, stretching far into the interior. This extensive tract, called by its first European explorer the *Grey District*, is watered by the *Kawatiri* and three smaller streams, viz., the *Tramakau*, *Arahura*, and *Okitika*.

The *Mawhera* is a fine river, affording much land fit for arable purposes, some good grazing districts in well-sheltered positions, and excellent sawing timber. The shingle bed of the stream abounds with coal, though of inferior quality to the seam near the sea coast. In it is also found the stone used by the Maories for rubbing down their *poenamoo*, or jade, which is something like a Newcastle grindstone, but closer in the grain, and has a better cutting quality. Several of the bends of the river are as picturesque as nature can make them; the undergrowth on the banks is a mixture of beautiful shrubs, and the adjoining bush consists of fine, lofty trees, with scattered patches of fern land; grass and open country, for the most part, bound the northern bank of the river to the average extent of between three and four miles.

The north branch of the *Mawhera*, which runs nearly parallel with the sea-coast, has long reaches of shingle border on either side; on the north bank there is a thick forest reaching to the chain of mountains that bound the coast. The timber is chiefly pine, with a belt of manuka nearest the water. The southern branch of the *Koturakaoka River* flows from an extensive sheet of water called the *Brunner Lake*, which is connected by a short channel with another smaller lake, from the head of which there is a passage to the east coast. *Brunner Lake* has an area of about six or seven square miles, is very deep, with a sandy or mud bottom; in some places there are large granite rocks, and near the middle is a small island. The neighbouring country is a level bush; bounded by a pine forest, and surrounded on three sides by black birch hills of moderate elevation; towards the east the land is low, but the district is shut in by a high mountain region, towards the south-west. From Mr. Brunner's account, the *Grey district* appears to offer a fair field for colonization, in all respects, except the absence of an harbour. So far as we know at present, there are none nearer than those on *Banks' Peninsula*.

Passing the *Grey district*, we re-enter

the region of rocks, precipices, torrents, and mountains, so graphically described by Mr. Brunner, who, from his own experience, and the accounts of the natives, concluded that the country to the southward continued equally barren and forbidding, and that though it might be possible to follow the coast down to *Dusky Bay*, (provided the danger of starvation could be guarded against,) the only result would be the gratification of curiosity. He adds:—

"I am sure there is nothing on the west coast worth incurring the expense of exploring, but I certainly think the natives there, require something to be done for them. They are quiet, and do no harm, and ought to have some share of the attention that is paid to the natives who are amongst the white population. They have all books, both bibles and prayer-books, but their condition would be much improved by giving them a few good axes, and some other tools, as also some nails, of which they are very fond and know the value. They are much cleaner in their habits than the natives in the settlements, and they have better houses, most of them having chimneys, and also bedsteads, or rather a raised floor, on which they sleep. I trust something will be done for their welfare, in which I take great interest. It would be a very trifling expense to convey a few things to the *Kawatiri*, from whence the natives themselves would gladly distribute them down the coast. The introduction of goats would much benefit them, and ultimately ourselves."

Leaving the western, we now proceed to examine the eastern portion of the *Middle Island*.

To the southward of the *Wairau* plain and valley, down to near *Banks' Peninsula*, there is said to be a continuous succession of mountains and hilly ranges alternating with grassy plains. One isolated peak termed *Kaikora*, attains the height of 9,300 feet, others rise 4,000 to 5,000 feet.

The subjoined account of the leading features of the country, as far southward as *Double Corner*, is framed from the statements of Messrs. *Weld* and *Hamilton*, published by order of the Governor-in-chief. The first of these gentlemen (a *Nelson settler*), in December, 1851, explored a route between the *Awatere River* and *Port Lyttelton*, by which stock of any kind may be safely driven, with the advantage of good pasturage during the whole journey. Mr. W. J. W. *Hamilton* accompanied Captain *Stokes*, R.N., while engaged on the survey of the eastern coast, in 1849, and described the character and extent of the plains lying between *Kaikora Peninsula* and *Double Corner*. It must, however, be borne in mind, that these opinions

are founded upon but cursory personal examination, aided by native reports, and that in a country where appearances are so deceitful, and the soil so variable and uncertain, as in New Zealand, the eye of even these practised observers could form but a partial judgment of the capabilities of such extensive tracts.

Much of the country among the offspurs of the Kaikoras is at some height above the sea level, and is covered by a mixture of bushes, grass, and scrub, while frequent patches of black birch on the hill-sides indicate the inferiority of the soil, which, from its light puffy appearance, appears to be frequently covered with snow. In some of the water-courses among the mountains light has never penetrated; the fissures rise in perpendicular walls, separated only by a few feet, and are overhung with vegetation. Juniper bushes, dwarf nettle, and broad-leaved English dandelion, mark a climate different to the contiguous plains. On a peak near the sources of the Awatere river, there is a curious semi-cylindrical aperture that looks like the extinct crater of a volcano. In attempting to explore the valley leading inland from the Kaikora peninsula, to gain such a view and knowledge of the country as would enable him to judge of the most eligible route between the Awatere and Waiau-ua rivers, Mr. Weld found that the river whose banks he trusted would take him to the head of the valley, issued from between two mighty and precipitous walls, several thousand feet high, cleaving the very heart of the mountain, whose summit is here above 8,000 feet above the sea; a more fearful chasm could not be found in Switzerland. To seaward the Kaikoras rise abruptly from the coast, and are well wooded. The *Awatere River* has its origin in the Kaikora and Mongatere mountains; numerous rivulets and rills unite to form the main stream, which is joined in its progress to the ocean by several smaller rivers. The main channel pursues its course between the spurs forming the inland base of the Kaikoras amidst scenery of wild sublimity; in some places winding with snake-like twistings and writhings, amongst volcanic rocks and cliffs, presenting at every turn the most romantic features; in others flowing through level valleys, or meandering amidst undulating downs. One of the most remarkable of the latter tracts has been called the Fairfield Downs, from its picturesque character and natural advantages of wood, water, and luxuriant herbage; the district being irrigated by the Isis and other tributary streams of the Awatere, which at this point of its sea-bound course takes a sudden bend to the south-westward. Some miles above the ford at Fairfield Downs the river is joined by a considerable stream, running from a high dark mass of castellated crags, and after passing some remarkable needle rocks, flows in a direct course through a narrow plain some five miles long, with an even breadth of half-a-mile. Small rounded hills, with bare rocks peering through their grassy sward, are ranged at either side as regularly as if placed there by a surveyor; "and such," says Mr. Weld, "is the artificial and street-like appearance of the place, that I could hardly divest myself of the idea that I was looking up a long vista of some grass-grown remains of Cyclopean architecture." The view is closed by a conical peak, at whose base the river divides into two

branches. Near this point, amidst an array of fantastically-shaped rocks, there is one of a steeple-like formation, consisting of a solid block of stone, rising from the plain to a height of about fifty feet. The well-grassed valley of this stream seems central between the Kaikoras and the inland ranges of Mongatere.

The mountains of the Kaikora ranges here bear evident traces of volcanic action, and among the lower ridges, on ground covered with yellow or reddish dust, glittering with mica, quartz, and feldspar, or again presenting the appearance of a deserted brick-field, there is the greenest and most luxuriant vegetation, whilst the dark-coloured scorioid and basaltic rocks rise in every describable and indescribable form of dome, and spire, and minaret.

The opposite inland ranges are of a more rounded and massive form, generally presenting bare summits, covered with small pieces of freestone, like a macadamized road; at their base the vegetation is good, but not luxuriant. The valley of the Awatere has a communication with that of the *Waiau River*, by means of the *Tuakuku River*, which pierces the inland range, and joins the latter from the northward. A beautiful grassy plain lies at each side of the *Waiau-ua River*; from thence to the *Hurunui River* the track of downs and valleys is, in the opinion of Mr. Weld, the finest he has seen in either island, and for the greater part not inferior for sheep farming.

The general character of the coast line of hills from Hurunui to Double Corner is bold and rounded, occasionally limestone, but oftener of clay, gravelly, or sandy formation. The vegetation throughout is exceedingly rich, and though in many places rather rough, and not capable at present of being very heavily stocked, it is generally a clean wool-growing country, with a great variety of herbs and grasses, apparently little affected by the seasons.

The country watered by the *Waiau-ua* and *Hurunui* is described by Mr. Hamilton as consisting of two plains, the latter about twenty-five miles long by fifteen broad, contains 242,000 acres; while that of the *Waiau-ua* is, according to the natives, double this size, or 484,000 acres, all level, so remarkably so indeed as to look, hemmed in as it is by hills and mountains, like the dry bed of some lake. Grass of the finest description abounds everywhere on these plains, generally knee deep, but in many places on the banks of streams or soft ground, breast high. The few swampy patches are covered with luxuriant grass. The soil on the banks of the rivers was deep, of excellent quality, and fit for putting the plough into at any moment. About one-third, either from swampiness or having been covered by a considerable depth of gravel in some great flood, is at present only suited for keeping sheep and cattle. The *Waiau* is only separated from the *Hurunui* at its head by a low rise, and is consequently easily accessible to drays.

From the *Hurunui Plain* to Double Corner a succession of low limestone ranges, alternating with sandstone, extend from the coast, and in lines parallel to it, to a distance of ten or twelve miles inland. These ranges lie close together, are somewhat abrupt, and abound in deep water-courses, and excellent keep for sheep. Towards the coast the gullies are wooded; but nowhere on the hill sides, except in deep sheltered glens, is wood to be seen. On the mountains, however, rimu (red pine), totara, kahikatea (white pine), matai (black pine), and towkai (or black birch) [a beech], are in abundance.

At the north-east foot of Mount Maukateri is the picturesque grassy plain of the Waipara, about fifteen miles long by eight miles broad, and containing some 70,000 acres.

In concluding his report, Mr. Hamilton estimates the actual amount of land between Double Corner and Kaikora Peninsula, taking the mountain range on the west of Hurunui and south-west of Waiau as a boundary, at 1,600,000 acres, divided as follows:—

	Acres.
Plain—Waipara	about 76,000
" Waikare	38,000
" Hurunui	240,000
" Waiau-ue	480,000
Undulating land and downs	100,000

934,000

Leaving for rugged country, but good }
for sheep-runs } 566,000

The next great block beyond, from Kaikora peninsula to Kowiniwini is by the sketch nearly of the same extent; but as it may be much broken, I will attempt only an estimate of that adjoining the Waiautoa, to which, from its size, I may fairly allow a course of fifty-six or sixty miles, with an average breadth of ten miles available land on its banks.

	Acres.
This would give about	358,000
And allowing for broken country } suited for sheep, one-third }	152,000

510,000
1,500,000

Total, with last block . . 2,010,000

THE CANTERBURY DISTRICT AND COUNTRY TO THE SOUTHWARD.—The tract selected by the Canterbury Settlement comprises Banks' Peninsula, and the greater part of an extensive plain, or series of plains, which, commencing a few miles to the southward of the forty-third parallel, extend along the eastern coast in a south-westerly direction for about a hundred and fifty miles, having a breadth in the centre of about fifty miles, which diminishes at either end. The land has a very gradual rise towards the interior of the island, and also to the southward: at Taumutu, near Lake Waihora, the surface is not more than eight feet above the sea-level, but at the Hakatere or Ashburton river, (the south-west boundary of the Canterbury Settlement,) it has a height of thirty to forty feet.

Several rapid and shallow rivers rise in the snowy mountains which form the inland boundary of this extensive tract, and flow by nearly direct courses to the sea; the most important of these are the *Ashley*, the *Waimakiriri* or *Courtenay*, the *Waikirikiri* or *Selwyn*, the *Rakaia* or *Cholmondely*, the *Wanganui* or *Wynne*, the *Hakatere* or *Ashburton*, and the *Rangitata*. Timber is only

found in small isolated clumps, and with the important difference of having probably been recently covered by the waters of the ocean—the great southern plain of New Zealand resembles in some points the immense prairies of North and South America.

Of the Canterbury District, the northern portion is distinguished as the Wilberforce Plain, the central as the Sumner Plain, and the south-western as the Whately Plain; the eastern is occupied by Banks' Peninsula, whose rugged heights (sometimes attaining an elevation of 3,000 feet) and densely-wooded surface, form a striking contrast to the level and open country in its vicinity. It has been before stated that Mr. Tuckett, when engaged in exploring the Middle Island for a suitable site on which to plant a Scottish colony, examined and rejected this district (*vide p. 245*), of which he has furnished me with the following description:—

"Banks' Peninsula is mountainous, its summits are frequently hidden in the clouds for many successive days, and like other mountainous peninsulas, it has a disagreeable climate—gales of wind and heavy rains being frequent. The near vicinity of immense mountain masses to the north of it, and the long, low, and dreary intervening plain which affords no shelter, renders it a very unattractive locality. There is some good upland pasture about Port Cooper, especially on its southern shore; the rest of the peninsula (which comprises, in all, an area of about 250,000 acres,) is, for the most part, wooded, but it is rather bush land than forest. A steep and lofty ridge, 2,000 feet in altitude, intervenes between Port Cooper and the plain, whose northern and western slopes afford good pasture for sheep; that on the plain itself is very inferior, the grass growing only in isolated tufts—a narrow frontage to the north excepted, which affords a limited quantity of fertile land suitable for enclosure and cultivation. Around the Waihora Lake is a vast extent of swamp filled with a dense growth of bull-rushes; if any portion of this can be hereafter drained, it will prove far more valuable for occupation than the rest of the plain, three-fourths of which is irremediably arid and sterile. On the banks of a few of these rivers there is a little fertile land. Such spots are favourite residences of the natives, for the advantages they afford for the cultivation of potatoes as well as for fishing."

In July, 1851, at the meeting of the British Association for the advancement of science, Mr. Tuckett declared that the vast plain was for the most part too arid and stony, or too wet and swampy, to be eligible for occupation, adding—

"There is but a very limited quantity of fertile land good enough for tillage, within a distance of twenty miles of either of the harbours of Banks' Peninsula. The surfaces of plains in New Zealand usually present a succession of terraces in lines parallel with the courses of the rivers, rising in steps of from six to fourteen feet in elevation. Much

of the surface, is desolated by a closely-imbedded boulder and shingle; and usually where these occur of the greatest breadth, and where there is a dead level, the surface is the most stony. On the hill lands of Banks' Peninsula there is good pasture; but it is not so on the plain."

Several points in the above account derive confirmation from a trigonometrical survey and topographical delineation of a "part of the Canterbury Settlement," issued by the Canterbury Association in 1851, but unaccompanied by any descriptive notes. From this it would appear that between the site of the embryo town of Lyttelton and the estuary into which the Avon disembogues, there is a tract of sand-hills and swamp four miles long, by three to four miles broad; to the north of Lyttelton is a swamp of five to six square miles, mostly dry in summer, and to the south-east of the town there are also extensive swamps, stretching as far as Lake Waihora, and tracts covered with "raupo," flax, and rushes: to the east and north-east are the open Sumner Plains of grass and fern. Sand-hills and swamp stretch all along the coast from the mouth of the *Avon* to that of the *Ashley River*, a distance of more than twenty miles; these tracts are three to five miles wide, and contain only here and there patches of grass and fern. Between the Courtenay and Ashley, a distance of fifteen miles, at ten miles from the coast, in what is termed the Mandeville District, there is another swampy tract about twelve miles long, by ten broad, mostly dry in summer, and with a few patches of flax and grass, and manuka scrub. This district is intersected by the *Cust* and *Eyre* rivers, which disembogue into the above mentioned swamp, whose southern boundary is an anastomosing branch of the *Courtenay River*. The settlers have chiefly selected their lands within five miles around the town of Lyttelton, which has been laid out in a plain called Christchurch, about six miles in a direct line from the sea, and five miles from Banks' Peninsula. The site of the town occupies an area of one square mile, and is surrounded by a space reserved for a park varying in breadth from a quarter to half-a-mile. The Avon river, or rather creek, flows through the town from south-west to north-east, and is navigable for boats throughout, to its mouth in the lagoon on the north of Banks' Peninsula. The banks are five to twenty feet in height, the waters cool and clear, and the rise and fall during rain and drought not more than two feet.

A road, including a bridge and sea-wall, necessary to connect the port with the town of Lyttelton, a distance of about eleven miles, is now being formed; it is estimated that it will cost more than a thousand guineas per mile. The most expensive portion is over the Port Lyttelton mountains, where the gradient is one in nineteen over an ascent of two miles in distance.

At the Port, a jetty, store, and about fifty cottages have been erected; at the Town nothing worthy of note has yet been done.

About 25,000 acres of land have been sold by the Association; twenty ships have been despatched to the settlement, containing 3,500 emigrants, of whom about three-fourths were of the labouring class, and the expenditure of the Association has been already not less than £100,000, including £25,000 borrowed from the New Zealand Company.

The soil of the surrounding portion of the plain, where not swampy or shingly, is a sandy loam, with a sub-soil of sandy clay; the vegetation grass, flax, and fern; and there is little if any timber adapted for building purposes within reach. The settlers must therefore make bricks to build their houses, or construct them of clay, or possibly of stone, until wood can be cheaply obtained by importation.

Opinions very different to those of Mr. Tuckett, have been entertained by other authorities, respecting the eligibility and attractiveness of the Canterbury district. Captain Stokes, R. N. (the surveying officer of H.M.S. *Acheron*), has expressed himself in general, but very favourable terms respecting the plain, as also with regard to the undisputed merits of the port; so also have Bishop Selwyn; Messrs. Fox, Mantell, Hamilton, and Weld; Mr. Thomas, the chief surveyor, despatched by the Association, to prepare for the reception of emigrants, reported to his employers, in May 1849, that, although like all extensive districts, portions of it were of inferior quality, but a very small part was swampy, and much of the soil was well adapted for agricultural purposes; while the whole tract afforded excellent natural pasturage, and was well adapted for agricultural purposes. In a report of a committee of the Canterbury colonists in New Zealand, made in 1850, with reference to pasture regulations, statements are set forth which agree with those of Mr. Thomas:—

"The whole country comprised within the bounds

of the Canterbury Settlement is peculiarly adapted to the purposes of grazing and the depasture of cattle and sheep; not so much by reason of its extent, which to a certain degree is limited, but from the peculiar features of the country—the richness and fertility of its soil, its extent of level land, its temperate climate, and its abundant supply of water by the innumerable rivers and water-courses by which it is intersected.

“The high lands and mountain slopes by which it is enclosed, and which extend the whole length of the colony, from Double Corner at the north-east, to the southernmost part of the settlement, being highly fitted for sheep stations, whilst those large tracts of country which lie at the foot of the mountains are of a flat and slightly undulating character, and afford pasturage of the best description, as well for the breeding and propagation of cattle, as the maintenance of sheep, and being open land, free from woods and bush, highly productive of herbage and well watered, are equally well calculated for agricultural purposes, when occasion shall require them.”

The appearance of the district, even judging from the description of one of its warmest advocates, Mr. Godley, the resident agent, can scarcely, however, be deemed inviting; writing in August, 1850, he says:—

“To the eye there are but two features—a range of mountains thirty or forty miles distant, and a vast grassy plain (the colour of which, as seen from a distance, is not green, but rather that of hay,) stretching from the sea towards them, as far as the eye can reach, without any inequality, and almost without any variety of surface; for streams, though numerous, are not large, and they are sunk between very steep banks; and the patches of wood are, unfortunately, both rare and small. The grass on the plain is intermixed with fern and flax.”

South of the great plain, lies the undulating country of *Timaru*, which is described, as having a very promising appearance; still further southward, beyond a small stream called the *Waihao*, a grassy plain of five or six miles in width, extends between the coast and a low ridge called the *Cheviot Hills*, which continue to approach the sea, until they terminate in an open plain, watered by the *Waitangi* or *Waitaki*, described by Bishop Selwyn as being forty or fifty miles in length, and twelve in width, and stretching east and west, without a tree or shrub.* The grass near the mouth of the river is of an inferior description, but as the stream is ascended, the soil improves.

* *Church in the Colonies*, Part iii., p. 14.

† Of this block the settlement, according to the prospectus issued in November, 1847, comprises 144,600 acres of land, divided into 2,400 “properties,” each “property” consisting of sixty acres and a quarter, divided into three allotments, namely:—a town allotment of a quarter of an acre, a suburban allotment of ten acres, and a rural allotment of fifty acres. The sum to be raised on these “properties” at 40s. an acre, would amount to £289,200,

At *Moreaki*, or *Moerangi Bay*, in latitude about 45° 30', a tract of country extends for ten miles north and south of the native village of *Moeraki*, which is described by Mr. Tuckett as a beautiful and fertile district, replete with advantages for the site of a settlement; affording a gently undulating surface, a rich deep soil, abundance of luxuriant pasture and flax land, and frequent streams, not torrents, of fresh water. The woodland is conveniently dispersed, comprising timber of the best description, (the *mai*, or black pine, being especially plentiful), enough, but not too much for the facilities of occupation. Good building-stone, brick-earth, materials for cement, and coal, are also obtainable, and but for the subsequent discovery of a still larger tract of equally promising country, the Scottish settlement would have been established here.

Between *Moeraki* and *Otago*, a distance of forty miles, there are some fertile valleys divided by hilly ridges, almost equally good. At *Waikouati*, there is a Wesleyan mission station; Mr. Jones, an enterprising whaler, merchant, and farmer, resides there, and successfully cultivates a considerable quantity of wheat land; several other English settlers are likewise engaged in agricultural pursuits.

OTAGO, AND THE SOUTHERN EXTREMITY OF THE MIDDLE ISLAND.—The Otago block or district comprises an area of 400,000 acres,† extending from 45° 50' to 46° 20' S. lat. It has a good ship harbour (the only one between *Banks' Peninsula* and *Foveaux Strait*, a distance of nearly 300 miles), abundance of unwooded fertile land, open grassy pastures, interspersed with an adequate supply of timber; a navigable inland water communication, running up the centre of the block for nearly its entire length, and rich land, remarkably well watered on either side of it. To the westward, stretching away to the far distant *Snowy Mountains*, which border the opposite coast, is an immense sheep walk, open to the farmer and flock owner.

of which three-eighths, or £108,450, was to be employed in emigration; two-eighths, or £72,300, to be employed by the New Zealand Company, in founding the settlement, and contingent expenses; one-eighth, or £36,150, to be appropriated to religious and educational uses; and two-eighths, or £72,300, to be appropriated to the New Zealand Company. Nothing like this amount of land had, however, been disposed of at the close of 1850, or in June, 1851.

Though two degrees south of Banks' Peninsula, the climate is as mild, if not milder, in consequence of the greater distance of the "Southern Alps," and the less exposed nature of the country. The natives are few in number, and well disposed to Europeans, who find in them intelligent and useful coadjutors. With all these natural advantages, so rarely combined, with building materials and coal readily available, the Scottish settlement, formed and zealously promoted by a Presbyterian Association, composed of men of high character, (among whom the celebrated Dr. Chalmers took a leading part,) and established by a small, but worthy band of honest and energetic pioneers, led by Captain Cargill, and their minister, the Rev. Thomas Burns,—has made but little progress. The pernicious effects of the selfish policy pursued by the New Zealand Company, (with whom the Otago Association unhappily connected themselves,) were never more fully exemplified. Undeterred by the mortifying results which had attended the fixing of a ruinously high price for waste land, and the disgraceful "town acre" lottery system, with its attendant jobbery, delusion, and disappointments, both at Wellington and at Nelson, they raised the price of land, which had been 20s. per acre, at the former, and 30s. at the latter place, to 40s. at Otago, and planned the town on their usual exaggerated scale; thus at the outset, excluding the very class of small farmers, for whom the settlement was peculiarly adapted, and making the progress of the town contingent upon the efforts of a large and wealthy population. The effect of these two fundamental errors, not to mention many minor ones, is manifest. The Otago Association, at the close of November, 1850, "owing to a combination of adverse circumstances which have retarded their progress,"* had disposed of no more than 18,000 acres out of the 144,000 comprised in the settlement, and the number of persons who had embarked thither direct from the United Kingdom, amounted only to 1,400.

By the latest accounts, the town, which is called Dunedin (the Celtic name for Edinburgh), comprises about 150 habitations, most of which are constructed of wood, or clay, and roofed with shingle: the streets which have been laid out, are

sixty-six feet wide, but they are neither gravelled, drained, or lighted; and within the civic boundaries, there is about one dwelling to five or six acres. The Scottish kirk is a commodious wooden structure, there is also a manse and school-house. Sites for the markets and public buildings have been reserved in the principal streets. The position of Dunedin is extremely picturesque; it stands at the head of the harbour, and is intended to occupy the whole water frontage, and stretch for some distance inland; but the chief part of the existing habitations are built between two small hills, in a thoroughfare called Princes-street, which runs in a continuous line, north and south, through the town. Lofty hills form the background of the town and harbour, wooded to their summits, and are said to afford "a very rich soil of dark vegetable mould, in some places several feet in thickness."†

Port Chalmers, where all ships are obliged to discharge their cargoes, is situated midway between Dunedin and the Heads, that is, about seven miles from either extremity of Otago Harbour; a small, but thriving community is established here. Eighty suburban sections have been chalked out, and about a hundred more, in a line between Port Chalmers and Dunedin.

From the *Otago News*, the only newspaper published in the settlement, it would appear that the colonists complain of the want of proper provision on the part of the Company, especially in the non-formation of roads, which has prevented the land-purchasers from settling on the rural portion of their "properties," and induced them to expend their little all within the narrow limits of their suburban section. (*Otago News*, April, 1850.)

A settler, (whose name is not given,) in a letter published in the *Otago Journal*, likewise complains that the roads being "merely formed out of the soil, are more like canals of liquid mud and clay in winter, than any thing else;" and after adverting to the heavy drain upon the capital of the infant settlement, consequent upon its dependence on other colonies for supplies of provisions, he adds, with perfect truth, "were facilities given to the labouring men to cultivate the ground, this would soon be at an end."

Since the above was written, a drag road

* Vide *Otago Journal*, published in Edinburgh by the Otago Association.

† Vide letter from the Rev. Thomas Burns, published in the *Otago Journal* for November 1848.

has been formed from Dunedin to "Scrogg's Creek," on the Taieri river, and other improvements have been made to facilitate communication in the vicinity of the town, which it must be remembered was only established at the commencement of 1848.

The following observations respecting the physical features, and soil of various parts of the Otago district, are given in small type to save space:—

The soil is described by the Rev. Thomas Burns, as a strong, rich, yellowish clay, containing generally a small mixture of sand, with a covering from three or four inches to a spade's depth of black vegetable mould; but all appears to be excellent wheat soil, calculated to bear a long succession of cropping with little or no manure. In many places the clay passes into a strong, fine, reddish-coloured earth. The open, as well as the fern-land, does not produce well until turned up and exposed to the sun and air; but the bush-land bears admirably the first year.—*Otago Journal*, 1849, p. 69.

To the west of the town, separated from it by some grassy hills, is the Kakarai valley, a tract of open land, with a rich alluvial soil apparently well adapted for agriculture. The Taieri River enters the sea about twenty miles to the southward of Otago Harbour, and for the first five miles from its mouth, is confined within lofty and precipitous hills, with barely sufficient distance between them to afford it a channel; beyond this the valley suddenly opens, and the river branches, leading to the Waiholo Lake, or lagoon, on the south, and passing through the bulk of the valley, on the north, which is said to contain about 40,000 acres, of which two-thirds are available for cultivation, and one-third swampy, but drainable.

At the head of Waiholo Lake, where a landowner named Valpy, who has greatly benefitted the settlement by the expenditure of a considerable sum of money in labour and improvements, has a farming establishment, and a sheep and cattle-station—the country consists of undulating downs, round topped, and covered with grass and herbage of various descriptions; but this tract, like the Taieri Plain, is somewhat deficient in wood.

The Tokomariro Plain is quite level for fifteen miles, and is estimated to comprise an area of 14,000 acres. To the eastward, hills with a breadth of seven miles, extend to the coast; to the north lies the portage of six miles, between the Tokomariro and the Waiholo Lake; to the westward, undulating prairies of great extent, said to be available for cattle and sheep three parts of the year.—*Otago Journal*, 1848, p. 12.

There is no formidable obstacle to prevent the formation of a road from this plain to the Rakitoto Lake, or lagoon, which is about eighteen miles from the mouth of the Molyneux River. This lagoon is about six miles long, and distant about twelve miles from that of Waiholo.

The Tokomariro and Taieri Plains are separated by a mountainous and difficult tract, from the valley through which the fine river Matau, or Molyneux, takes its course. This valley or plain is described by Dr. Munro as containing from ten to twenty thousand acres of undoubtedly good land, covered with a fine growth of grass, flax, &c., interspersed

with a fair sprinkling of wood. The landscape he mentions as "altogether one of great beauty and unusually rich softness."

According to Mr. Tuckett, "The river Matau (Molyneux), inland, just below a place called Twikitea, is separated into two branches by a narrow island about ten miles in length. The lake the natives call Kari Tongato, the western branch of the river Koau; it has the deepest channel. About twenty miles inland, above Twikitea, on the river Matau, is the Kunna-Kunna station, a fishery resorted to by the natives at particular seasons, when the fish so named ascend the river in vast quantities from the ocean. Lampreys also enter the Matau, the Waikauwa, and other rivers in the south, at certain seasons of the year, and ascend far inland, managing to surmount both falls and rapids; at such obstacles they link themselves in chain, and the hindmost probably propel the foremost.

"South of the Matau there is a tract of large forest on lofty and rugged hills, which the natives are afraid to enter, alleging that great, hairy, and very strong men, who do not speak, inhabit the wooded mountain. They call them *Miroro*, and say that they can easily carry off a man. There is, perhaps, some foundation for the fear, and the supposition which is probably traditional, for there may have been, at no very remote period, gigantic apes, as well as gigantic birds, in the country."

Bishop Selwyn, in describing the Otago District, says—

"Cape Saunders, Pikiwara (Saddle Hill), and the ridge near Dunedin, appear to have been upheaved by volcanic action, through the great alluvial plain which forms the eastern face of the Middle Island, and of which the Taieri and Matau (Molyneux) districts, over which the sections of the Dunedin settlers are spread, form a part. The fault of this settlement is dispersion, its advantage will be the range of down-like hills which open to the southward, sometimes of great height, but often of small size, with flattened tops of uniform elevation, as if a sea of lava in a state of wavy motion had been cooled under the pressure of a solid plane resting equally upon it; or, to use a simpler description, as if a dish of rolls in an oven had been baked with a tray lying on the top of them. This wavy country is considered to be admirably adapted for sheep pastures. The want of firewood will be the chief inconvenience at the sheep stations in this island; but Otakou (Otago) itself is abundantly supplied from the wooded banks of the river."—(*Visitation Tour*, 1848, p. 114.)

Colonel Wakefield likewise expressed a high opinion of the capabilities of this district, and draws a comparison between it and Port Cooper decidedly favourable to Otago, stating forcibly enough, in one of his reports to the directors of the New Zealand Company, that:—

"At Port Cooper, half of the labourers' time would be consumed in bringing fuel from a distance from any suitable site for a settlement; and it may be safely asserted, that a section of fifty acres there would not pay the cost of fencing, and building on it, in the course of the owner's life. The neighbourhood of Otago is on the contrary, essentially, as was

observed to me by a labouring man from Nelson, a poor man's country—containing good land and plenty of wood."

At Tokato Point, the southern boundary of the Otago District, a range of lofty hills stretches inland, which affords shelter from the cold southerly winds. An opening occurs in this hill range about fifteen miles from the coast, which presents an easy route, along fertile land, to Tuturau, a native village, on the river Mataura, and thence to the Waropai, the east branch of the New River, or Eureka, which flows into Foveaux Strait.

The country westward of the Molyneux River (watered by the Mataura, the Eureka, or New River, and the Aparima, or Jacob's River), was traversed by Mr. Hamilton and Mr. Spencer, of H.M.S. *Acheron*, in 1850. They consider it to offer peculiar advantages for the formation of an extensive settlement, and state that the plain which stretches eastward from the latter-named stream, comprises at least 600,000 acres of rich soil, clothed with fine grass, and with timber, everywhere very equally distributed. Eastward of this plain, a chain of densely-wooded hills, before mentioned, extends as far as Molyneux District, having, towards the sea, an elevation of about 2,000 feet. Inland, however, the hills gradually decrease in height, and the masses of forest disappear altogether, giving place to the finest pasturage. The absence of timber may possibly be compensated by peat or turf, of which there are some indications in a valley little more than half-way between Tuturau and the Mataura River. At Tuturau the soil is extremely rich; and the potatoes grown there, by a single resident Maori family, exceed in bulk those brought by Bishop Selwyn from the Chatham Islands, which were nine inches each way. The climate is very equable, though rather wet towards the sea coast. Snow rarely lies on the low land: ice was occasionally seen between 15th March and 1st June, when the thermometer ranged from 40° to 60° Fah.; on a few occasions the mercury was at 32° Fah.: the wind veered from north-west to south-west.—(*Vide* Report of Messrs. Hamilton and Spencer, given in a letter from Captain Stokes to Lieutenant-governor Eyre, dated Wellington, 1st September, 1850.)

At the same period, Captain Stokes, R.N., examined the sea-board from Otago to Preservation Harbour, a distance of 220

miles, and found only four roadsteads and one intermediate port. Of twenty-three rivers in this extent of coast line, he states that but four are available for small vessels; and only two—the Waikawa and Omaui, or New River, for ships of from three to four hundred tons. The latter "was ascended in a whale-boat for near thirty miles, in a north-half-east general direction. In that distance the land rose gradually 200 feet, by three steppes, each change of elevation being attended by corresponding and somewhat dangerous rapids. The depth of water varied from two to eight feet; the width from 50 to 100 yards. The soil, on either bank, consisted of a rich mould, and appeared clothed with trees or verdant pasture, as the stream wound through clumps of wood, or swept across the open plain." This river Captain Stokes considers highly important, from its vicinity to Bluff Harbour, (from whose head waters it is separated only by a portage of half-a-mile,) and its connexion with the extensive tract so favourably described by Messrs. Hamilton and Spencer. Captain Stokes says, his first view of this "prairie land" was from the summit of the Bluff, a basaltic hill of 855 feet high, from whence the plain appeared stretching between south-east and north-west, in the shape of a bishop's mitre, measuring full 100 miles: isolated patches of woodland were agreeably dotted over its surface; and a range of rugged, snow-clad mountains, the highest of which (distant eighty miles, and 6,700 feet in altitude) he named the Eyre, terminated the extensive landscape. In conclusion, he expresses himself strongly on the advantages offered by the land in the vicinity of Bluff Harbour for a settlement, adding, that it has one peculiar to itself—namely, that it is fully a fortnight nearer to England than any other portion of New Zealand now under colonization.

A paper containing the above statements respecting the south-eastern extremity of the Middle Island, was read at the meeting of the British Association before referred to. Mr. Tuckett dissented from the opinions expressed of its eligibility for colonization, on the following grounds:—

"Having had occasion to examine carefully the district described, I can fully confirm the accuracy of the observations in respect to the vast extent of available surface which exists south of Tuturau and the Mataura river to the shore of Foveaux Straits; between the Eureka or New River and the Aparima westward, as also to the east Eureka. I cannot,

however, concur in recommending it as a district eligible for a settlement. Instead of its affording good pasture for grazing or fertile soil for husbandry, in my judgment the surface is rather nude, and the vegetation, chiefly large, detached bunches of a very coarse sharp-edged junk. Where the banks of the Aparima and Eureka are wooded, I found chiefly the totara and the manuka growing luxuriantly, but in deep sand; whilst those portions of the gently undulated uplands which are wooded would afford, almost exclusively, varieties of the birch, which abounds and attains great dimensions even on the poorest land. The earth presents a surface of a whitish hue when dry, without mould or humus, being a deep and gritty clay (as I found by frequent digging), which I am convinced would not bear any adequate crop without being first well manured. Between the east and west branches of the river Eureka the land is low and sandy. Eastward to the coast is a vast bed of fine quartz gravel covered with heather and luxuriant mosses; and in some places peat occurs of pretty good quality and considerable depth. There is good timber at the western extremity of Bluff Harbour, and between it and the river Eureka some extent of bush land, in and around which a herd of cattle finds sufficient pasture, but feeding chiefly on the milk thistle, &c. There is a small community of Europeans at the Bluff and at the Aparima, who have intermarried with the natives, and who, pursuing whaling, sealing, and husbandry, and in a few instances stock-keeping, have attained to very comfortable circumstances. Some were in the practice of growing wheat, but they informed me that the climate was unfavourable, rains being frequent and copious, and the gales of wind boisterous. While my vessel lay at anchor in the Eureka in the month of May we had to encounter, in the surveys executed and on our several exploratory journeys, very inclement weather. Considering then the climate, the soil, and the natural growth, I am convinced that there is no very eligible site for a future settlement south of the Mataura river and Tu-tu-rau; a favourite residence of the natives formerly, when they were more numerous, because it afforded shelter from the southern climate, good fishing, and fertile land. From Tu-tu-rau north to Otokau there is an unbroken tract of fertile and well-watered land, affording abundant pasture and much of it of excellent quality for tillage. It abounds with supplies of coal, wood, timber, brick-earth, stone, conveniently dispersed through the district and very accessible by the facilities of inland navigation which its rivers and lakes afford."—*Athenæum*, July, 1851.

NEW LEINSTER, RAKIURA, OR STEWART ISLAND.—The southernmost of the New Zealand group, derives its usual appellation of Stewart Island from the master of a trading vessel, who, in 1816, discovered its insularity, and named the strait which divides it from the Middle Island "Foveaux," which appellation it still retains.

The strait is about fifteen miles wide from north to south, seventy miles from east to west, and has at some seasons the aspect of a tranquil arm of the sea, with numerous islets dotting the space between shore and shore. The largest of these, named *Ruapuke*,

lies at the south-east entrance of the strait, and is about five miles long and five broad. It is very picturesque, containing all the characteristic features of New Zealand in miniature; native villages, woods, swamps, hills, lakes, bays, and rocky headlands. The island has about 200 aboriginal inhabitants. Mr. Wohler, a German missionary, has been established there since 1844, and his labours have greatly benefitted the natives residing there, and also at Stewart Island and Bluff Harbour. A Mr. Kelly also lives at Ruapuke, and is described as an intelligent and successful colonist; his Maori wife is a good and religious woman; and he has a fine family of promising children. The climate of this little island is humid, but extremely mild; so much so, that frost sufficient to wither the hulk of a potato is there unknown. The navigation of Foveaux Strait has been facilitated by the recent surveys of Captain Stokes, to whose meritorious labours on the shores of Australia frequent reference has been made in vol. ii. of this work.

Stewart Island is of a triangular form, the apex bearing due south: its length from north to south is about fifty miles, and its greatest breadth from north-west to south-east is about the same. The area is estimated at 1,400 square miles = 896,000 acres; the highest altitude is about 3,200 feet. The west coast runs nearly due north and south for about fifty miles; the south-east shore along Foveaux Strait extends for about sixty miles, and the southern shore for about forty miles.

The 47th parallel of latitude and the 168th of longitude, intersect the island. The coast-line, according to Captain Stokes, is strangely distorted in the charts now in use, the south coast excepted, which was laid down by Captain Cook with his accustomed accuracy.

The shores are very pleasing, woods feathering down to the water's edge, and noble bays indenting the coast at short intervals, with rocky points, interspersed with brushwood, between them.

Paterson river, the chief stream in the island, disembogues in the strait, a little north of the 47th parallel; the harbour at its mouth, called *Port Somes*, is very extensive, has many bays and coves, is easy of access, convenient for heaving down, affords good shelter, and is surrounded by fine timber. There are several British adventurers residing here on a narrow tongue of land,

most of them have married native women, and some have lived twenty years in these solitudes. These men have clearly a claim to the land in right of their wives and children,* and in consideration of their own industry and enterprise. Their small clearings exhibit a fertile though shallow soil, and they have a small amount of stock. The valley of the Paterson river extends east and west across the island, to the northward of it the country is mountainous, and affords but little available land; to the southward it is more level and promising. The coast between Port Somes and *Pegasus Bay* or *Southern Port* presents a remarkable similarity in its general features, in the structure, elevation, and composition of its rocks, in the frequent serratures of its surface, and the varieties of trees growing on it, to the shores of the far-distant extremity of the North Island.

Pegasus Bay is a noble harbour, situated a little to the east of South Cape, of which, about three leagues distant, are some dangerous rocks, named by Cook, the Traps or Snares.

The temperature is described as less cold, even in mid-winter, than might be expected from its high southerly latitude, and the number of parrots flying about give the island almost a tropical appearance. Mr.

Tuckett also speaks of the climate as "far more eligible than that of any place on the northern shore of Foveaux Strait, on which during the inclement season, and at all seasons, are spent the fury of south-east and south-west gales, whose violence would appear to be increased rather than diminished by the proximity of an immense mountain region.

LAND IN CULTIVATION, AND LIVE STOCK.

—This sketch of the topography of New Zealand may be concluded with the following statements of the land in cultivation, and the live stock owned, by Europeans, in the latest year of which there are returns, viz., in the New Munster province:—

Settlements or Districts.	Acres in crop.	Horses.	Horned Cattle.	Sheep.	Goats.	Pigs.
Wellington .	860	672	6,786	35,507	1,111	2,008
Petre . . .	10	67	886	582	178	15
Nelson . . .	3,069	234	3,540	37,699	5,353	3,239
Akaroa . . .	329	16	679	4,396	310	627
Otago . . .	53	103	781	7,731	206	1,035
Total .	4,321	1,062	20,672	85,915	7,158	6,924

Note.—This does not include cultivation or live stock among the Maories. The Wellington returns include the flocks and herds in the Wairarapa District, and the Nelson those depastured in the Wairau and Kaikora Districts.

In New Ulster cultivation and stock, in 1849, was—

Settlements or Districts.	Number of Acres in Crop.										Stock.

New Plymouth	914	68	116	4	175	99	529	55	783	2,748	53	904	1,443	66
Total .	2,214	660	350	1,530	3,350	557	1,879	375	4,837	15,027	1,313	10,694	6,617	900

Note.—The number of acres of land uncultivated is put down for Auckland at 25,062; Manganui, Waingarua, and Kaitia, 508,368; New Plymouth, 27,523. The land of the other districts is not known.

The total number of acres of land granted in New Ulster to 1849, was 269,923, of which 6,427 acres were sold.

In New Munster, the grants have been, to the New Zealand Company, in Wellington, 209,247 acres; Porirua, 68,896; and in Nelson, the grant to the Company, under Mr. Commissioner Spain's award of 1844, "probably conveys more than three

* When Bishop Selwyn visited Stewart Island in 1843-44, the whole English population in the neighbourhood of Paterson's River, Horse-shoe Bay, and Half-moon Bay (three beautiful harbours in the space of seven miles), assembled to meet him, comprising ten men, fourteen or fifteen native women, and twenty-five children. The men were all desirous

or four million acres: the quantity has, however, never been estimated, nor have the boundaries been surveyed. The scheme of the settlement only provided for the sale of 201,000 acres. The grant is understood to comprise all the lands in Blind and Massacre Bays, and all the lands sold by the Nga-ti-toa tribe to government, on the south side of the Strait, in 1847.—Blue Book for 1848; p. 55.

of being married, and the bishop, after special inquiry, assented, and afterwards baptised seventeen of the children. At Murray's River, a small stream to the westward of Half-moon Bay, four other Englishmen were married to the Maori women, by whom they had already "a tribe of children," all of whom were cleanly and tidily dressed.

CHAPTER III.

GEOLOGY—FOSSIL BONES OF GIGANTIC BIRDS—SOIL, MINERALOGY, CLIMATE, AND DISEASES.

IN this recently, and still but imperfectly explored country, the geologist can do little more than record isolated facts, and collect the materials by which, hereafter, the physical structure of these interesting islands, and the successive changes which have taken place in organic life, may be determined. The results of the investigations already made are most unexpected and important, and offer the highest encouragement to those who may emigrate to New Zealand to pursue the subject, and explore a field of research almost untrodden, and promising a rich harvest to the careful and intelligent observer.

The fundamental rocks of the Northern and Middle Island of New Zealand are composed, so far as has yet been ascertained, of metamorphic schists and clay slate, with dykes of greenstone and compact amygdaloidal basalt, intruded masses of obsidian, vesicular, and trachytic lavas, and other igneous products. Hornblende and porphyritic rocks, gneiss, and serpentine occur, but granite has been rarely observed. The Northern Island has, in its centre, a group of lofty volcanic mountains, already described as ranging from 7,000 to 9,000 feet in altitude, of which, however, one only (*Tongariro*) is now in igneous activity. In the Middle Island, a lofty range, covered with snow, and called the *Southern Alps*, passes from north-east to south-west, for about 500 miles; it is composed of schistose metamorphic rocks, flanked by volcanic grits, and covered at their base by alluvial deposits, which have evidently originated from the decay of trachytes and earthy lavas, and the detritus of the hard materials which entered into their composition.*

Jameson says, that the scenic character of New Zealand is such as might be supposed to have resulted from the simultaneous upheaving, by volcanic force, of argillaceous and basaltic rocks and mountains, which have been subsequently disintegrated and rounded off by the action of the ele-

ments. Rocks of the primitive and secondary classes are extensively found in some parts of New Zealand; and there is abundance of transition slate in the neighbourhood of Hokianga. Isolated masses of quartz occur in several places; but the predominant structure and aspect of the rocks and mountains mark them as belonging to the igneous classes denominated trap, basalt, and greywacke.†

The southern shore of the Waitemata, on which Auckland is situated, consists of cliffs of soft pepper-coloured sandstone, or sandstone conglomerate, with occasional seams of lignite. Several volcanic cones in the immediate neighbourhood furnish hard scoriæ for building and making roads. Between Waitemata and Manukao, a number of cones containing extinct volcanoes rise above the even table land. The coasts, in many places, exhibit recent sedimentary depositions placed horizontally; or terraces formed of loam and gravel, with fragments of wood, fern, &c., rise 50 to 100 feet above the ocean. The small rocky islands of trachyte, off the coast of the Northern Island, bear marks of the action of water to the height of 100 feet above the present sea level. In several places there are boulders of trap rocks, in terraces, 50 feet high.

The western shore of the estuary of the Thames differs widely in its aspect and geological structure from the shores of the peninsula of Shouraki. It presents to the waters of the frith a range of horizontal, stratified rocks of a clayey sandstone, which seems to have been softened by the influence of humidity, and is devoid of organic remains.‡

The country to the westward and northward of the Bay of Islands may be regarded as a volcanic table land. The hills around the Bay of Islands are formed of a yellow argillaceous stone, and a basaltic rock. The high land on the upper part of the Wairoa River (*Kaipara*) consists of a stiff, whitish clay, with, here and there, a basis of a hard

* See *Quarterly Journal of the Geological Society* for August, 1850; p. 340.

† *New Zealand*, by R. G. Jameson, Esq., London, 1842; p. 244.

‡ *Ibid*, p. 305.

argillaceous slaty rock : lower down, on the left bank, are steep hillocks of basalt ; on the right shore, and towards the sea coast, is a soft ferruginous sandstone ; inside, and round the northern head, the cliffs expose layers of lignite, four feet in thickness, and superimposed to the height of about twenty feet, by a white, slightly consolidated sand, which softens by an exposure to the water, and, on a near examination, is found to consist of decomposed pumice stone, of which large globular boulders are still compact. The lignite consists of half carbonized wood. In some places, small carnelions, magnetic iron sand, and boulders of brown iron ore, are met with.*

At Manukao Harbour, the shore at the head of the haven is strewn over with hard basaltic lava and cellular scorix, which appear to have flowed from a cone on the southern shore. The clifly, northern shore consists of stratified, greyish sandstone, or sandstone conglomerate. Proceeding towards the southward, pumice stone, mixed with sand, imbedded so as to form a pavement, is found near the Waikato River, down which pieces of black obsidian are conveyed from the volcanic Tongariro group. At Wangaroa, there are picturesque cliffs sixty feet high, composed of coarse-grained limestone, more or less crystalline, and containing several varieties of fossil shells. The head of the harbour consists of a bluish clay, without any organic remains : the southern shore is formed mostly of ferruginous sandstone. Basaltic rock, containing small grains of olivin, is seen at an arm of the harbour, which extends some distance inland. At Aotea, the hills which bound the harbour are composed of limestone.

The cone of Mount Egmont, which attains an altitude of 8,270 feet, consists of cinders, or slags of scoriaceous lava, of various colours—white, red, or brown ; in some places reduced to a gravel. At 1,500 feet from the summit, where the snow commences, not a patch of soil exists where plants could take root. The summit of the mountain is a field of snow, of about a square mile in extent. Here and there were found protruding blocks of scorix, of a reddish-brown colour, some slightly vitrified on the surface. The vast cone (see map) is separated from the platform out of which it abruptly rises by a deep indentation, which descends laterally towards the sides of the mountains. The exterior cone

appears to be a hard lava, of a bluish-grey colour, which resounds to the hammer like phonolite, or clink stone, and breaks into large tabular fragments. Dr. Dieffenbach, who first ascended Mount Egmont in 1839, remarks, that there seems to be a great scarcity of simple minerals in the principal rock of which this mountain is composed.

The west shore of Lake Taupo consists of black trachitic, or basaltic escarpments. Near the village of Te-rapa, gaseous effluvia seem to have converted the rock of the neighbouring hills, which is basalt, and occasionally amygdaloid, into a red or white clay, of a soft and alkaline nature, which the natives use instead of soap, and, according to Dr. Dieffenbach, sometimes eat.

The shore of the lake near Te-rapa, is of basalt, containing much augite. Some pieces are tabular, with a smooth surface. Smaller boulders are cemented together by the sediment of the springs, into a conglomerate, which has the appearance of an osseous breccia, from the imbedding of encrusted and polished white wood, and of rolled pieces of pumice-stone. The adjacent hot springs contain a great quantity of silicic acid held in solution, less by the great heat than by the alkaline elements of the water. Stalagmitic efflorescences are formed from the solution, and all substances thrown into the water are quickly petrified ; chalcedony is also deposited. In some of the springs are found sulphate of iron, and sulphuretted hydrogen gas.

The truncated cone of Tongariro, estimated at 6,200 feet in height, is described by Mr. Bidwell as composed entirely of heaps of loose cinders. This still active volcano is regarded as the centre of the modern igneous action of the Northern Island of New Zealand. Hot springs, fumeroles, and boiling mud pools are seen in every direction, and extend to the north-westward, to White Island, a smoking solfatara.

Various localities in the Northern Island bear manifest indications that frequent upheavements, and many convulsions must have alternately elevated and depressed the surface ; at one period, allowing time for a stately growth of timber, then sinking it into the depths of the ocean, where, after the lapse of ages, the gradual deposit of mud attained a thickness of 100 feet, when another convulsion upheaved the whole ; this terrific force frequently repeated, has shattered the whole country, and given the islands their singular form. The Rev. R.

* Dieffenbach, vol. i., pp. 269, 270.

Taylor is of opinion that the general framework of the New Zealand Islands is probably as ancient as that of other parts of the surface of the earth.*

The Sugar-loaf Islands, near New Plymouth, consist, with one exception, (which is of yellow and soft sandstone,) of steep and conical masses of a greyish trachyte, containing much felspar, with scarcely any vegetation on them. Towards Sugar-loaf Point, large boulders are found, consisting of volcanic rocks, of an old date, such as basalts, greenstones, trachyte, augitic rock, &c., cemented together into an extremely solid conglomerate, which appeared to Dr. Dieffenbach to extend like a stream of lava from Mount Egmont into the sea. In some places, the sandy downs, at a little distance from the shore, are covered with a hard crust of oxydated iron-clay, which forms fantastic shapes of tubes, saucers, &c., owing to the oxydation of the particles of iron in the sand, by water and air, and subsequent adhesion to each other. These and other appearances indicate that the volcanic powers of which Mount Egmont was the centre, have been formerly very active. On both sides of Sugar-loaf Point there are aqueous formations, consisting of cliffs of yellow clay, containing, in some places, the remains of trees, belonging to species still existing in the island, embedded in discoloured blackish earth.

Near the Urinui river, the cliffs on the sea shore are about 100 feet high; the lowest formation is a marly clay, in which is embedded protophosphate of iron, in small balls, of an earthy consistence; about twenty feet above the sea level, there is a formation of wood, very little altered or carbonized, and about ten feet in thickness; the superincumbent strata is a loam soil. Towards Mokau, the shore cliffs consist of a micaceous, soft, yellowish sandstone, which the sea and wind have moulded into many strange forms—here a fort, there a wall, a round tower, or a balcony crowned with shrubs. In some parts, large boulders of trap rock protrude out of the cliff, the soft deposition around having been washed away, thus giving the appearance of artificial excavations.

The coast-line of Tory Channel, towards its north entrance, shews everywhere argil-

laceous schist in stratifications from east to west, and dipping to the north: sometimes no stratifications are observable, and the rock is of a more granular nature, but still very soft, and with fissures in various directions, as if it had been acted upon by fire. No indications of any other kind of rock have been noticed in Cook Strait, except the occasional appearance of Lydian stone, massy basaltic rocks and greenstone. From the various transitions from one kind of rock to another, this structure would appear to have been caused by the infusion from below of the trappean rocks, and the consequent metamorphosis of the slate rocks. No organic remains have been found in the latter, and the hills in Queen Charlotte's Sound, therefore, most probably belong to the transition series.†

Information respecting the Middle Island is more scanty. Mr. Tuckett and Mr. William Davison, in their capacity of surveyors, have, however, collected much valuable data; and Mr. Walter Mantell, who traversed the eastern coast, from Banks' Peninsula to Otago, made notes of the geological phenomena observable in his route, and transmitted to England a large collection of the minerals and fossils of the country.‡ Banks' Peninsula is chiefly composed of a group of igneous mountains; a lofty range cropped with metamorphic rocks, separate Ports Albert and Cooper; these rocks dip to the eastward on the Port Albert side, but incline at a considerable angle to the westward on the opposite slope.

The "Ninety-mile Beach" is a continuous line of shingle, without bay or headland, extending southward from Banks' Peninsula. The level country inland, consists of a substratum of slightly coherent gravel, principally composed of pebbles of schist, jasper, white, yellow, pink, and green quartz, covered, in the opinion of Mr. Mantell, by a layer of rich loam, which varies in thickness from a few inches to ten feet.

At the undulating country of Timaru, the superficial deposits are similar to those on the great plains, but superimposed on a vesicular volcanic rock, which reaches a height of fifteen feet, then gradually dipping to the south, it disappears in the course of a few miles. A bed of lignite coal, ten feet thick, is said to crop out on the bank of a

* *The New Zealand Magazine*, published quarterly, No. II., for April, 1850; printed at Wellington, New Zealand.

† Dr. Dieffenbach's *New Zealand*, vol. i., p. 57.

‡ His father, Dr. Mantell, has recorded the results of his son's investigation in two interesting memoirs, published in the *Geological Journal*, for 1845 and 1850.

stream inland of Timaru. The Pukehuri range, which bounds the great plains, and is a spur from the Southern Alps, is about 1,000 feet high; it is composed of highly inclined strata of slate, covered by a ferruginous conglomerate of quartz pebbles. The Waiareka country exhibits strata of a yellow and fawn-coloured limestone, generally friable and porous; the beds decline gently in various directions, and are very cavernous.

At Kakaunui a section of the coast shows (1) clay, without organic remains; (2) diluvial gravel, consisting chiefly of quartz, trap, amygdaloids, &c.; (3) volcanic grit; (4) the sea beach. A mile south of Kakaunui, strata of a tertiary blue clay, containing numerous shells of species existing in the neighbouring ocean, first appears. Further south the clay contains layers of septaria, varying from one to five inches in diameter; some of a sub-globular form, and some spherical; others are found broken and glittering with yellow and brown crystals of the calcareous spar, with which all the interstices of the septaria are lined or filled; many have a zone or belt of clay. With the exception of the zone, the septaria found in New Zealand are evidently similar to those that occur in the London clay off the coast of Sussex, which are used for Roman cement: the colonists will therefore possess an abundant supply of that valuable material. On approaching the district of Otago, boulders of serpentine, of various shades of green, are plentifully scattered on the sand hills around Purakauanui and "Blue Skin" Bays. By far the greater part of the geological specimens collected on the coast and country between Banks' Peninsula and Otago belong to plutonic, volcanic, and metamorphic rocks. There are no specimens of granite. Of the igneous products the most abundant are obsidian, basalt, and many varieties of amygdaloids, jade or nephrite, gneiss, serpentine, greenstone, chlorite-slate, micaceous-schist, silicious and clay-slate, &c.; sulphate of barytes, compact zeolite, and garnets, many varieties of chalcedony, agate, quartz, and jasper, semi-opal, onyx, and some masses resembling the green or chlorite jasper of India. The unaltered sedimentary deposits are limited to the stratified limestones of Ototara, which resemble the chalk of Europe in the general nature of their fossils (containing terebratula, echini, sharks' teeth, &c.); of

DIV. VI.

Anaamatara; and the argillaceous strata of Kakaunui, &c. About 1,500 specimens of fossil bones, containing skulls, beaks, foot, and other bones, together with portions of egg-shells, have been sent to Dr. Mantell by his son from New Zealand; all, with the exception of a few bones of two species of seal, and one thigh-bone of a dog, belong to birds.* The shells appear to have been so large that a hat would have made an "egg-cup" for one of them. Some of these curious specimens were found in 1846-7, in a bed of *meanaccanite*, or titaniferous iron-sand, near the embouchure of a stream termed the Waingongoro, between Wanganui and Waimate, on the west coast of the Northern Island; others were obtained by Mr. W. Davison, in the Middle Island, at Waikouaiti, about twenty miles north of Otago. The fossil bones of birds collected by the Rev. W. Williams from the beds and banks of fresh-water streams, were chiefly from the shores of Poverty Bay, and those sent home by Mr. W. Swainson were from the vicinity of the Bay of Islands. The Rev. Messrs. Colenso and Taylor, Mr. Earl, and other gentlemen, have made collections of fossil bones.

The gigantic *Moa*, or *Dinornis Giganteus*, (some species of which must have been from ten to fourteen feet high,) is supposed by the natives to exist at the present day in the unfrequented and almost inaccessible wilds of the interior. Traditions are rife that the *Moa* were once very numerous, and served as food for the remote ancestors of the present Maori population. Some of the largest species are stated to have been seen alive by natives, who describe the head and tail as adorned by magnificent plumes of feathers, which were worn by their ancient chiefs as ornaments of distinction. But the facts at present known lead to the inference that although the extinction of the colossal species of *Moa* is comparatively recent, there is no probability that any individuals have existed during the last century; possibly some of the smaller types may have been exterminated within the last fifty years, and may even now dwell in the unexplored parts of the interior of the islands; but of the gigantic species there seems no hope of our obtaining any living specimen.

The *Dinornis Giganteus* possessed a skull and beak essentially different from any

* There are upwards of sixty genera of birds in New Zealand, and but one indigenous mammalian quadruped, a species of rat, known to naturalists.

other known recent or fossil form. The cranium approaches the shape of that of reptiles: it is characterized by the nearly vertical occipital plane, the elevated position and form of the foramen magnum, and the great development below the occipital condyle; strong ridges border the basi-occipital; the temporal fossæ are very deep, and strengthened by a prolongation of the mastoid process, which is united to the frontal, forming a lateral zygomatic arch. These osteological processes indicate that the muscles which moved the skull possessed great power. The tympanic bone has two distinct cusps for articulation, with the double condyle of the os quadratum.

The configuration of the upper mandible or jaw, has been compared by Professor Owen to a cooper's adze; the whole beak seems, in conjunction with the three-toed claw, to have been specially adapted for tearing open the ground, and grubbing for roots and other food, such as tubers of different descriptions. The femur or thigh bone of a young bird in Dr. Mantell's collection is 14 inches long, 9 inches in circumference round the shaft, and 16 inches round the condyles: the tibia, or leg bone, is 30 inches long, 6 inches in circumference at the shaft, and 14 at the condyles. No vestiges of the bones of the wings have been as yet detected, and the extinct species probably bore a considerable affinity to the living order of apteryx, or wingless birds found in different parts of New Zealand.

Another genus, named the *Palapteryx*, differs from the *Dinornis* in the form of the skull, and in several osteological peculiarities; it appears to have somewhat resembled the emu of Australia, and must have had a remarkable development of the nasal organs.

Among the smaller sized fossil bones lately found, are some belonging to a genus named *Aptornis*, about the size of a bustard, and very closely allied to the apteryx; also those of the *Notornis*, a large bird belonging to the *Rallidæ*, or rail family; which, like the gigantic *Moa*, was supposed to have been long extinct, no traces of its existence having been seen since the coming of Europeans. A living specimen of the notornis has however been very recently captured in Resolution Island, in Dusky Bay, on the southwest coast of the Middle Island, the skin

of which was preserved and sent to England.*

Nestor is the name given to a genus of nocturnal owl-like parrots, of which two species are known; one peculiar to New Zealand, and the other† to Phillip Island, a small rock adjacent to Norfolk Island; the last-named species is said to be now extinct. The femur of a dog is the only fossil relic of a mammal that has been discovered.

MINERALS.—The Great Barrier Island, and Kawau Island in the Gulf of Hauraki, contain grey copper ore, in a matrix of decomposed micaceous slate. Some of the specimens, on assay, gave nearly twenty-five per cent. of copper, the rest being sulphur, iron, and silica. Mr. Brown‡ speaks of two copper mines having been opened in the neighbourhood of Auckland with highly satisfactory results, the ore being of the best quality, and obtained at a very trifling expense; some samples, he says, show "upwards of fifty per cent. of pure copper." The peroxide of manganese is said to be abundant in an island within fifteen miles of Auckland. Tin, lead, silver, bismuth, and nickel have been discovered, as also a titaniferous iron, in great quantities in various places. Sulphur is found in large masses about the East Cape. Coal, especially in the form of lignite, is plentiful, particularly in the Middle Island. It was reported to have been seen on a hill at the head of Port Cooper, but Mr. Mantell states, that on examining it in September, 1848, he was not surprised to find, instead of coal, "a bed of decaying obsidian," as he had found only igneous rock on all the surrounding mountains. A remarkable "coal cliff" was observed by Mr. Tuckett on the north side of Molyneux Bay, and on the south shore there are thick layers of lignite under cliffs of a soft ferruginous sandstone. The estuary of the Kawia is an extensive calcareous formation, the limestone being similar to that at Wangaroa. Rock salt has been discovered in the neighbourhood of Mercury Bay, and alum and nitre near the medicinal springs at the Roturua Lakes.

The substance used by the Maories for their tomahawks, and called by them *poenamu* (green talc, jasper, serpentine, or jade) is found chiefly in the channel of a lake, named *Te Wai Poenamu*, or "the water of green talc," situated inland from Otago.

* This bird (*Notornis Mantelli*) is figured, and described by Mr. Gould, in the *Zoological Transactions* for 1851.

† For a description of these birds, see Gould's *Birds of Australia*.

‡ *New Zealand* in 1845, p. 202.

It lies in small layers on the banks of the lake, and, like flint, has a whitish incrustation on its outer edges. It is soft when first dug from its watery bed, but hardens on exposure to the air, and when not formed too thick, is semi-transparent, having the appearance of crystallite. This stone is much valued by the natives, who make breast, ear, and neck ornaments of it, as well as hatchets and instruments of destruction.

An infusorial white earth is found in the bed of the large lake (Waihora), on the south-east of Banks' Peninsula; it is also observable in other places, and was at first supposed to be carbonate of magnesia; on minute examination, it has been ascertained that the usual lacustrine deposits are formed by the innumerable minute frustules of *diatomaceæ*, &c. The sand mounds on the shores of New Plymouth, consist chiefly of the siliceous shields of similar microscopic vegetables.

Whole districts are said to be formed of a cretaceous marl or chalk, extending from Hick's Bay to the Mahia, due west of Nukutaura, or Table Cape. Mr. Polack says, "these coasts are entirely formed of this material, slightly covered with a stunted furze."*

SOIL.—The predominant soil is of an inferior description, comparatively little alluvial land being found in the neighbourhood of rivers, while rich loams are only occasionally met with in the volcanic districts. Undoubtedly, there are tracts of more or less extent, of excellent soil, from which a crop of wheat, and one of potatoes may be obtained within the year, but from all the explorations and practical tests that have yet been applied, it does not appear that the quantity of good soil in New Zealand, is nearly so large as has been represented; some authorities, indeed, assert that the cultivable surface does not exceed five to ten per cent. of the entire area of the islands.

Dr. Dieffenbach is of opinion that the plains, strictly speaking, are not the produce of the rivers; but are a table land, composed of stiff clay, which can scarcely be worked, and which was deposited, as we now find it, not by the rivers, which are too insignificant to produce such results, but at the original formation and heaving-up of the land. At the borders and outlets of the rivers there is only a small extent of

true alluvial soil, the rest derives all the fertility it possesses from a vegetation which has covered it from the beginning—has decayed annually through ages, and has thus formed a layer of vegetable mould, in most cases very thin. The process resorted to, of burning off the vegetation to prepare the land for cultivation, destroys the vegetative powers, except where the fertile earth is of considerable thickness; and the pernicious native custom of lighting fires, in order to clear a road when travelling, has resulted in the exhaustion of whole tracts, where the soil, by care, might have yielded abundant sustenance for man.

Frequently, a volcanic region is one of extraordinary fertility, but this depends on the nature of the ejected matter; if it be mud, or even ashes, the surface, in course of time, becomes covered with vegetation, and a soil capable of tillage is produced; but igneous action in New Zealand seems, generally, to have caused an eruption of lava, forming large and hard masses of scoriæ, similar to the refuse of an iron foundry, which neither years nor weather can render fit for agriculture. The country therefore immediately at the base of the numberless volcanic cones, is generally ill adapted for tillage. At an ancient crater near Lake Maupere, the Maories have, with much labour, collected the large angular pieces of scoriaceous and vesicular lava and amygdaloidal basalt, which cover the sides and base of the cone, into heaps, and have cultivated the black soil between them.

At New Plymouth the soil is a fine and easily subdued loam, abounding, in its virgin state, with decayed vegetable matter, and having for its substratum an excellently proportioned composition of clay and sand, neither over consistent nor excessively friable. But in some places this last is more or less charged with hydrate of iron, which is poisonous to vegetation, unless rendered innocuous by a summer fallow, or a short exposure to the chemical influence of the atmosphere. The absence of lime in the soil is also a great drawback, as after several croppings the land produces a stunted and sickly vegetation, having what farmers term "a scabbed aspect." The nearest place at which lime is procurable is at Mokau, forty miles to the northward.†

CLIMATE in New Zealand, as in other Hospital, New Plymouth, dated Dec. 1849. Parliamentary Papers for August, 1850, p. 112.

* *Residence in New Zealand*, vol. i., p. 343.

† See an able report by Dr. Wilson of the Colonial

places, is to be determined in its character by equatorial position, elevation above the ocean level, insularity, prevailing winds, quantity of moisture, nature of the soil, and extent of cultivation. A glance at the map of New Zealand will indicate how varied, from most of these causes, must be the climate of a country stretching through twelve degrees of latitude, with ranges of mountains perpetually covered with snow,

with a very irregular configuration of the land, and with the whole eastern coast for about 1,500 miles exposed to the full fury of the tempestuous winds and of the surcharged clouds which rush from the antarctic circle towards the warmer northern regions. The following meteorological record, kept by Dr. A. S. Thompson, surgeon of H.M. 58th regiment, affords a comprehensive view of the climate of Auckland:—

Meteorological Table for the year ended July, 1849, compiled from observations made at Auckland, thirty feet above the level of the sea.

Months.	Great-est heat in shade.	Great-est cold during month.	Mean temperature.	Average daily range of temperature.	Power of Solar Rays.		De-grees.	No. of days on which rain fell.	Barometer, corrected to 32° Fahrenheit.			Quantity of rain, in inches.
					Mean.	Great-est.			High-est.	Lowest.	Mean.

Note.—A self-registering thermometer was used for the extreme temperatures, the mean temperature was drawn from four observations daily. The barometer during the year indicated the least pressure on the 18th October, 1848, the day on which the second severe shock of an earthquake was felt at Wellington; the two barometers used, gave the same indication on that day.

"The prevailing winds are westerly; gales from the eastward, accompanied with rain, usually occur about the full and change of the moon, and last three days. The most settled weather is with southerly winds. The barometer rises highest at the approach of easterly winds, and sinks lowest with south-westerly gales. During easterly gales, when the wind shifts from east to north, a change to the westward may be expected; but when it shifts from east to south-east, the gale may be expected to increase.

"The foregoing observations," says Dr. Thompson, "support the opinion that the mean temperature of the southern hemisphere is lower than that of the northern, although not to the extent laid down by Baron Humboldt. Thus Gibraltar and Malta, placed in very similar latitudes to Auckland, have a mean annual temperature ten and eight degrees higher, while Rome and Montpelier, in latitudes 41° and 43°, have a mean annual temperature similar to that of Auckland."

As, however, the observations of Captains Scoresby and Weddell tend to show that the supposed difference in the temperature of the two hemispheres does not exist in the open sea, the observations made at Auckland (a truly oceanic climate in almost every respect) will furnish data for comparison with the temperature at the Western Islands and corresponding places in the northern hemisphere.

At Auckland, the number of days on which rain falls will probably be found to be greater than at other parts of the North Island. This result is produced by the narrow neck of land on which the town is situated. Dr. Thompson spent part of the months of August and September, 1849, in the interior of the North Island, and although he saw ice a quarter-of-an-inch thick, and hoar frost on several occasions during the night, yet few wet days compared with what occurred in Auckland during the same period, were experienced.

The following return (compiled from data

CLIMATE OF NORTH ISLAND COMPARED WITH ENGLAND. 825

furnished by the authorities named in the note,) shows some of the elements of the climate of three localities in the North Island, for the years ended March 1849 and July 1849, and the annual average temperature and amount of rain which falls in London :—

Places.	Latitude.	Mean temperature of the year.	Mean temperature.		Aqueous vapour.	Mean barometer.	Quantity of rain, in inches.	Number of days in which rain fell.
			Warmest month.	Coldest month.				
London ¹	51° 30' N.	49	62	36	5.5	29.93	20.05	153
Bay of Islands ²	35 15 S.	64	75	55	—	—	—	99
Auckland ³	36 51 S.	59	69	51	4.5	29.92	51.84	179
Wellington ⁴	41 22 S.	58	70	48	—	29.99	54.33	115

Notes.—¹ Taken from an average of ten years, published in the *Statistical Companion* for the year 1848. ² For the year ending March, 1849, furnished by Staff Assistant-surgeon Robertson. ³ For the year ending July, 1849, kept by Dr. Thompson. ⁴ For the year ending March, 1849, kept by Surgeon Prendergast, 66th Regt. ⁵ The average fall of rain in the United Kingdom is about thirty-four inches, but in the western or hilly counties it is forty-eight or fifty inches.

It is obvious from the above return that the North Island of New Zealand has a climate, the mean temperature of which is higher,—the range of the thermometer less,—and the moisture suspended in the air greater than the quantity in England. To this evenness of temperature and moisture of the atmosphere in New Zealand, Dr. Thompson thinks, may be attributed the favourable nature of the climate for the non-development of pulmonary consumption, and the small ratio of deaths which has been found to occur from this disease among the military population stationed in the North Island.

Frosts are rare in Auckland, and the summer heat is tempered by the east and west breezes. The mean temperature of the summer months may be taken at 67° Fahrenheit, of the winter at 52°, and of the year at 59°. This annual mean corresponds with that of Montpelier, in 43° 36' N. lat., but there the difference between the hottest and coldest month is said by Dr. Dieffenbach to be 68° Fahrenheit. The heat of the warmest month in Auckland (which, as before stated, is situated in 35° 51' S.) corresponds to that of Vienna in 48° 12' N.; but its coldest month is somewhat below the temperature of the coldest month at Lisbon in 38° 43' N. The usual rise and fall of tides at Auckland is ten feet, but easterly winds sometimes raise them to twelve or thirteen feet; the time of high water at full and change is about six hours and forty-five minutes.

The climate of the northern parts of New Zealand may be considered as warm and humid, that of the southern as cold and humid. The quantity of rain that falls is not so very much in excess of New South Wales, but the terrestrial absorption is less rapid in New Zealand. More rain is said to fall in the neighbourhood of Kauri

forests than elsewhere, which may be partly owing to the elevated ridges and steep declivities in which this tree delights; possibly also these lofty groves exercise an electric action, causing the rapid precipitation of rain. Dense forests on mountain slopes in India and in other countries are known to influence the quantity of moisture in the atmosphere, and doubtless do so in the present instance.

At Wellington (lat. 41°) the quantity of rain that fell from April, 1841, to February, 1842, was 34.49 inches: the annual quantity in London is about twenty-three inches. The most rainy months in Cook Strait are thus shown:—April, 1.86; May, 3.11; June, 4.12; July, 3.84; August, 4.56; September, 4.51; October, 2.31; November, 2.95; December, 5.47; January, 1.16. The number of rainy days during these months—133. The dews are particularly heavy during the winter months, when there is least rain; in the interior fogs rest upon the lakes and river-courses, and are not dispelled until the sun has risen some degrees above the horizon. The mean temperature of July—the coldest month at Wellington—is 48.7; the greatest cold during the day, 38; greatest warmth, 57. The mean temperature of January—the warmest month—is 66.4; highest, 76.5; lowest, 57. Mean annual temperature, 58° 2'. The wind blows from north or north-west 202 days, and from south or south-east 141 days. (Dieffenbach, vol. i., pp. 176, 177.)

Out of 365 days, the same writer states, there were only twelve which could be called calm; he adds, that it is difficult to say whether the north-west or the south-east are the strongest winds. The former prevail during the winter months, the latter when the sun has a southerly declination.

The western coast of New Zealand is less affected by the violent winds than the eastern; a heavy gale has been known to blow at Wellington, when there was fine weather and only light winds at Nelson. Sudden alternations of rain and sunshine follow each other in far more rapid succession than is experienced in England. The climate of the interior of both islands is,

however, less changeable than that of the coast; in consequence of the presence of a snow-crowned mountain group, and the greater distance from the turbulent ocean.

By a register kept by Mr. Justice Chapman, at Karori, two miles from Wellington, and 591 feet above the sea, the state of the weather during the six winter months is thus shown:—

State of Weather.	April.	May.	June.	July.	August.	September.	Total.
Fine and sunny . .	21	19	16	18	18	21	113
Cloudy, but fair . .	4	2	3	1	1	0	11
Showery	5	4	6	8	12	8	43
Rainy	0	6	5	4	0	1	16
Gales of wind . .	0	6	2	2	3	4	17
Night frosts . .	4	4	3	5	3	3	22

Note.—During the day the temperature varied from 45° to 56°.

The above table conveys a much more pleasing idea of the climate in the vicinity of Cook Strait, than that afforded by Dieffenbach, Power, and other authorities, who describe the Strait as an immense funnel, through which, for the greater part of the year, a tempest rages without intermission, the mountains on either side serving to attract the clouds, and causing the precipitation of a superabundant quantity of moisture. The gales of wind are said to accompany the changes of the moon throughout the year.

Proceeding from Cook Strait to the southward, along the eastern coast, the rain and wind increases in quantity and in violence; at the New Canterbury settlement, and at Otago, the winter season is one of considerable severity, the icy blasts and southern sleet causing the most disagreeable sensations to the human frame.

The climate of New Plymouth is stated to be benign and temperate, whether with reference to summer heat or winter cold: sudden vicissitudes are rare; and the seasons succeed each other in almost inappreciable gradation. South-western and western winds prevail; the south and south-east are described as being the coldest and most disagreeable; and the northern as the most humid. Thunder storms occasionally occur, and slight shocks of earthquakes have been repeatedly felt, but have done no damage. The centre of these phenomena is generally thought to be the Tongariro mountain, but Dr. Wilson, who resided seven years at Wanganui, and experienced many of these *tremblements de terre*, says that the underground vibration, and the succeeding

oscillations, appeared to come in a direct line from Mount Egmont. There are several marshes; but the frequent rains, and the moderate temperature, do not allow exsiccation to proceed far enough for the peculiar fermentation necessary to the production of miasmatic effluvia.

Shocks of earthquakes have been recently frequently felt at Wellington; in 1846 there were twenty-four, in 1847, sixteen. These shocks have occurred in every month throughout the year. In 1846, ten took place in December; but the most disastrous earthquake of which we have any record, commenced on the morning of the 16th of October, 1848, and continued at intervals throughout the day; by its violence walls were cracked, chimneys thrown down, and considerable damage done to property. On the ensuing days many shocks were experienced, followed by tremblings of the earth, until on the 19th, at 10 minutes past 5, A.M., a terrible concussion shattered most of the houses and public buildings, rocked to and fro in a fearful manner the wooden structures, destroyed three lives, endangered several others, and filled all the inhabitants with consternation and alarm. Many persons, afraid of passing the night in any of the buildings left standing, notwithstanding the wild and inclement weather, fled to the hills or crowded on board a few ships then in the harbour, anxious to quit so frightful a scene;* terror and dismay reigned everywhere, the energies of all seemed paralyzed, the specie in the settlement was sent on

* The *Subraon* sailed with sixty-six passengers for Sydney, but she was wrecked within sight of Wellington, and the people cast back again on the land.

board HMS. *Fly*, and but for the refuge which the new church at Te Aro afforded, there would have been no shelter for the sick and maimed. The shocks and tremblings of the earth continued, and the Lieutenant-governor, on Friday, the 20th of October, proclaimed a solemn fast, which was reverently observed by all classes, who acknowledged the hand of the Almighty, and looked to him only for safety and protection.* The tremblings, and a lesser degree of vertical motion, together with a vibration along the earth's surface, produced apparently by a distant heavy concussion, and preceded by a loud rumbling noise distinctly heard in advance of the shocks, continued for several days. The earthquake was slightly felt at New Plymouth, Wanganui, Nelson, Akaroa, Otago, and the East Cape. The Maories have no recollection of such a severe and long-continued convulsion of the earth. The damage done to property was estimated at about £15,000.

[I cannot here avoid referring the reader to the worse than idle ceremonial with which the site of the town of Wellington was taken possession of by Colonel Wakefield, just nine years previous to this visitation (see Div. v. p. 160); to the seizure of the land and destruction of the buildings, on this very spot, devoted to christian missionary purposes; and to the disgraceful fact, that for several years after the foundation of the settlement, no temple dedicated to the worship of God was raised at Wellington, no land set apart for the purpose, no minister of the gospel provided and maintained by the New Zealand Company, to administer to the spiritual wants of the settlers whom they sent out, although it was boasted that, not without reason, they belonged to the highest class of society that had ever emigrated to a British colony.]

DISEASES.—When Cook first visited New Zealand, he observed with surprise the healthy condition of the people; he saw no diseased or deformed person—no evidence of any cutaneous disorder. A Maori, who had received a musket-ball through the fleshy part of his arm, had the wound quickly healed, owing to his sound corporeal state. There were many whose loss of teeth and hair indicated great age, but there was no decrepitude; and although not equal

to the young in muscular strength, they were not behind them in cheerfulness and vivacity.

Hospitals have been established at Auckland, Wellington, New Plymouth, and Wanganui, in which the Maories have been received as well as the Europeans. The report of the colonial surgeon (Dr. William Davies), dated 1st January, 1849, relative to the hospital at Auckland, is very gratifying. The number of patients treated during the year 1848, is thus shown:—

Return of the number of Patients treated in the Colonial Hospital, Auckland, during the year 1848.

Patients.	Europeans and others.	Aberigina Natives.	Total.
Internal patients:—			
Males	78	142	220
Females	40	16	56
Discharged cured:—			
Males	59	132	191
Females	35	15	50
Died:—			
Males	10	7	17
Females	4	1	5
External patients:—			
Males	9	315	324
Females	3	61	64
Remaining in hospital:			
Males	9	3	12
Females	1	0	1

Note.—The total number of internal and external patients was 664.

Of the Europeans admitted, forty-seven were military pensioners, and their wives and children: of this class, five died—about ten per cent. The proportion of deaths among all the European patients was about nine and-a-half per cent.: out of 534 native patients, no more than eight deaths occurred, and these cases were expected to have a fatal issue when they were admitted.

At New Plymouth, Dr. Wilson, an excellent colonial surgeon, stationed at the hospital, says, that the mortality among the Maories, and more especially among the females, has, within the last few years, been excessive, from the prevalence chiefly of catarrhal disease. During the year 1849, among the Ngatiruanui tribe, the deaths were nearly as one to ten. It is very generally alleged, that “of the total number of births, the male sex greatly predominates.” This, as stated in a previous volume, (ii., p. 508, 510), is, in my opinion, a marked and frequent indication of a decreasing population. Another fact noticed

* See Parliamentary Papers on New Zealand, of 10th May, 1849, p. 5, where these words are used by Lieutenant-governor Eyre.

by Dr. Wilson, is—that whereas, among the white population, sterile and childless couples are extremely rare, and a healthy progeny is rapidly augmenting, among the Maories the reverse is the case; and few couples are to be met with who have more than one or two children, and these are commonly a puny and sickly offspring.

The partial introduction of European clothing (especially blankets), tobacco, and ardent spirits, has been accompanied with many maladies. Influenza, scarlatina, consumption, and scrofula, have committed great ravages among the natives, while, on the other hand, an autumnal fever, prevalent at Auckland, of a mild form with them, assumes a dangerous and highly infectious nature amongst Europeans. In the autumn of 1847, it gained admittance at St.

John's College, Tamaki—spread rapidly in all directions, and terminated, in most cases, with typhoid symptoms. During 1848, an epidemic scarlatina appeared, for the first time, at Auckland, and of 146 who were attacked, eighteen died—one out of every eight cases. In one family, four out of five children died. Only one native (a servant in an European family), had the disease. Small-pox has not yet visited New Zealand. To ward off, if possible, this awful scourge of aboriginal races, the cowpock has been extensively disseminated; the civil and military officers have vaccinated many of the Maories; and it is hoped that this precaution, if not wholly successful, will greatly mitigate the disastrous consequences which almost invariably attend the first appearance of this malady.

CHAPTER IV.

POPULATION; ENGLISH AND MAORI OR ABORIGINAL—ANNUAL INCREASE OF SETTLERS—BIRTHS AND DEATHS—MAORI CHARACTER—PROGRESS IN CIVILIZATION—STATE OF RELIGION, EDUCATION, AND CRIME—MISSIONARY ESTABLISHMENTS—FORM OF GOVERNMENT, &c.

At the beginning of the year 1839, there were nearly two thousand Europeans in New Zealand, of whom about one-half were dispersed over the country, engaged in whaling and sealing, or in cultivating the land; while the remainder, attracted by the number of vessels which then resorted to the Bay of Islands, took up their abode in the Northern Peninsula, and pursued a profitable trade in the export of flax, timber, and other products.

As soon as the New Zealand Company commenced operations, it became a part of their policy to send out to New Zealand as

many emigrants as possible, in order that a claim might be founded for the grant of large tracts of land, in return for the sums thus expended. To accomplish this object every means were employed, but no attempts were made to proportion the number of the labouring class to that of the capitalist or proprietary emigrants. Indeed, from the very first, the lauded theories of “systematic colonization,” and what was infinitely of more consequence, “Christian colonization,” were entirely neglected.

The emigrants sent out by the Company up to May, 1843, were as follows:—

Description of Passengers.	May, 1839, to May, 1840.			May, 1840, to May, 1841.			May, 1841, to May, 1842.			May, 1842, to May, 1843.		
	Males.	Females.	Total.	Males.	Females.	Total.	Males.	Females.	Total.	Males.	Females.	Total.
Cabin Passengers—1st Class .	110	48	158	216	101	317	84	—	84	218	107	325
“ 2nd “	32	26	58	56	29	85

Total	668	467	1,125	1,714	1,327	3,041	1,552	1,442	2,994	889	747	1,636

INCREASE OF EUROPEAN POPULATION IN NEW ZEALAND. 329

Of these 8,796 persons, 4,431 were sent to Wellington, 3,335 to Nelson, and 1,030 to New Plymouth. Nearly three-fourths of the whole were despatched from England before the 17th of November, 1841; viz. :—

Passengers.	Males.	Females.	Total.
Cabin, 1st class . .	404	159	563
" 2nd class . .	63	29	92
Steerage—labourers .	3,035	2,662	5,697
Total . . .	3,502	2,850	6,352

The established British population in New Zealand from the period of the assumption of British sovereignty in 1840, to 1844, is given as follows, on the authority of the colonial secretary, Dr. Sinclair. In 1842 the first census was attempted :—

Localities.	1840.	1841.	1842	1843.	1844.
Auckland . .	—	1,500	2,895	2,522	2,754
Wellington . .	1,200	2,100	3,701	3,808	4,048
Nelson . .	—	—	2,500	2,942	2,915
New Plymouth .	—	400	895	1,091	1,155
Bay of Islands .	600	500	380	669	534
Hokianga . .	150	200	263	236	179
Akaroa . .	100	150	198	221	166
Petre . .	—	150	—	—	197
Total . .	2,050	5,000	10,832	11,489	11,948

It appears from various documents that, although 8,904 persons were introduced by the Company into their settlements, previous to 1847, only 7,973 were there in that year; and if the increase by births be taken into consideration, it becomes evident that a large proportion of the original settlers must have re-emigrated. According to the census of August, 1848, the number of children born in the colony, of European parents (exclusive of the military and their families,) was, 1,131 males, 1,333 females = 2,464. Of the whole population, the number born in England was, 2,522 males, 1,909 females; Wales, 22 males, 25 females; Ireland, 170 males, 105 females; Scotland, 597 males, 442 females; in British colonies,

150 males, 65 females; in foreign countries, 174 males, 97 females. Taking the total population of the province of New Munster in 1848, exclusive of the military and their families, at 8,903; and, subtracting the children born in the province, and the immigrants from British colonies and foreign countries, 3,008, there must have been much fewer than 5,995 of the New Zealand Company's immigrants remaining in 1848, as this number includes whalers and others who had settled in the province previous to the existence of the Company.

The political divisions of New Zealand have been so frequently changed, and the population and other returns are given under such different heads that it is not practicable to present a clear exposition of them in a tabular form: thus, for instance, the Northern Island is named *New Ulster*, and the Middle Island *New Munster*, but Wellington, although situated in the Northern Island, is included in the political division termed the *Province of New Munster*, while New Plymouth (Taranaki) is comprehended with Auckland, under the designation of the *Province of New Ulster*. More generally, however, the colonized portions of New Zealand are distinguished as the Northern or Southern Settlements; the former appellation being given to Auckland and New Plymouth, the latter to Wellington, Nelson, Akaroa or New Canterbury, and Otago or New Edinburgh. The returns, besides being given under varying heads, are grounded on very imperfect data, owing to the isolated position of the settlements, between which communication is difficult and infrequent, while a considerable number of the colonists themselves are scattered in various directions over the face of the country.

The following statement shows the *European* population in the Southern Settlements from the year 1843 to 1848 inclusive. Mr. A. Domett, the colonial secretary, says, that "in many of its items it can only be considered as an approximation :—"

Southern Settlements or Districts.	1843.		1844.		1845.		1846.		1847.		1848.	
	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.	Males.	Females.

There were in August, 1848, in New Munster Province, professional men, including doctors, lawyers, clergy, military officers, and surveyors, 84; land proprietors, farmers, and merchants, 253; manufacturers, brewers, and millers, 15; shopkeepers, and retail dealers, 105=457. Clerks, and overseers, 106; mechanics, and craftsmen, 779; manual labourers, pastoral, and agricultural, 955; carters, 46; mariners, and fishermen, 135; domestic servants, 72 males, 192 females. Not classified—naval and military pensioners, 7; males, principally children, 2,198; females, 3,409; strangers, 13.

The buildings of stone or brick numbered 96; of wood, 1,008; of clay, wood, &c., 633; 31 houses were slated, 977 shingled, 549 thatched, and 180 weather boarded. The outbuildings numbered 1,465. The number of breweries were, at Wellington, 3; at Nelson, 3—brick-kilns, at Wellington, 2—candle manufactories, 1—cloth or stocking-loom, Nelson, 2—cooperages, Wellington, 5; Nelson, 1—Flax mills, 1—rope-walks, Wellington, 2; Nelson, 2; Manawatu, 4—flour mills, wind, Wellington, 2; water, 1: Nelson, 3 steam; Wellington, 1—lime-kilns, Wellington, 1; Nelson, 1.

The Secretary for the New Munster province furnishes, amongst other information respecting the population of the province, the following data:—

"POPULATION.—General Increase.—In the years 1845 and 1846 the population of New Munster had decreased 5.68 per cent. on its amount in 1844; but in 1847 and 1848 it increased 20.62 per cent. on its amount at the end of 1846. In Wellington during the latter two years the increase was 17.06 per cent., in Nelson 9.00 per cent., on their respective populations in 1846.

"Increase by Births.—The number of registered births is no guide to the actual number that took

place in the province in 1848, as it is certain that very many occurred which were never registered. But even those that were, amounted to 3.55 per cent. on the population at the end of 1847. An approximation may, however, be made to the real rate of increase by births, by comparing the number of children in the province under two years of age with the numbers of the population at the end of the years 1845, 1846, and 1847. As the returns for those years were taken in December of each year, and the return of children in August 1848, the amounts of population at the periods mentioned may be considered the correct numbers of those of whom the children were the produce. The average population of these three years was 7,645 souls. The number of children under two years (deducting those belonging to Otago, the inhabitants of which settlement arrived in 1848), that is, the number born between August 1846 and August 1848, was 760, which gives an average of 380 for each year. The increase, consequently, on the population in 1846 and 1847 was at the rate of 4.95, or nearly five per cent. per annum, by births alone. The deaths in 1848 were only .81 per cent. on the population of that year (the number who died being added to its amount). This would give 4.14 for the actual rate of annual increase of the population, exclusive of immigration. In Great Britain the increase of population for ten years, from 1831 to 1841, (allowing for emigration) was 15.02 per cent., or 1.50 per annum. The per centage is, however, too low for New Munster, as the births of those who died under two years of age are omitted in the above calculation.

"The large proportion of deaths in Nelson, as compared with Wellington, in 1848, was occasioned by the number of infants dying that year of whooping cough. In the same year, throughout the province, the deaths were 1 in 123 of the whole population. In England, in 1842, 1 in 46.08; in the United States (no date given) 1 in 37.

"Original Extraction of the Population.—The centesimal proportions the inhabitants of different origin in the province bear to the whole population respectively are as follows:—

51.66 . . .	per cent. born in England.
12.16 . . .	" " Scotland.
.55 . . .	" " Wales.
3.21 . . .	" " Ireland.
2.39 . . .	" " British Colonies.
3.17 . . .	" " Foreign Countries.
26.51 . . .	" " New Zealand.

99.85

Thus it appears that there are, exclusive of the military, more than four times as many English as Scotch in the province, and nearly four times as many Scotch as Irish. The foreigners are principally Germans, and the French at Akaroa.

"Proportion of Sexes.—In August, 1848, there were about 1,000 more males than females in New Munster; an excess equal to about one-ninth of the whole population. This excess is greatest among adults between twenty-one and forty-five years of age. At Wellington the actual excess of males of this age is about four times as large as in Nelson, though the population is only half as large again. The proportion of females born is considerably greater than of males, judging from the number alive under two years old in 1848; but the proportions are reversed with respect to all the other sep-

ennial periods given. The number of females considerably exceeds that of males in England and Ireland.

“Immigration and Emigration.”—The only result apparently, that can be arrived at upon this subject is an approximation to the excess of re-emigration over the immigration that has taken place independently of that set on foot by the New Zealand Company in the first colonisation of the country. Deducting from the total population of August 1848, which amounted to 8,543, the number then existing of persons born in the colony, which by Return No. 2, is shown to have been 2,264, we have 6,279 immigrants still in the province. Taking the whole number introduced by the New Zealand Company as 8,904 souls, and allowing 1,200 for New Plymouth, we

have 7,704 for New Munster. If the number of immigrants at present in the colony be subtracted from this, the remainder is 1,423, which represents the excess of loss by death and re-emigration, over gain by immigration other than that caused by the New Zealand Company in founding the settlements of the province. As the deaths in question, by a calculation from the loose returns we have of them, amount to between 400 and 500, the excess of loss by re-emigration would be about 1,000. The actual number of them that belonged to the body sent out by the Company, the returns do not enable us to ascertain.”

The population of New Ulster, according to the *Blue Book* for 1849, was—

Note.—In the official return from which the above statistics are taken, the Maori population for the Auckland District is not given.

In a despatch from Governor Grey to Earl Grey, dated Auckland, March 22, 1849, it is stated that in the northern half of the Northern Island—

“There are, exclusive of the military and pensioners, not more than about 2,388 males of all ages, not more than 1,500 of whom can be regarded as adults; and the above number of 1,500 adult males includes all the civil officers of the government, the police, custom-house officers, persons employed in military works or in the supply of the troops, and aliens, who here are numerous.

“The number of males belonging to the regiments quartered here, and to the corps of pensioners, is 1,793, that is 293 in excess of the adult European male population of all other classes. The number of natives may perhaps be stated for all ages and sexes, at 80,000.

“In the southern half of the Northern Island, that is in the province of New Munster, the number of European males above twenty-one years of age, exclusive of the military, is 1,657, and in this number are included all the civil officers of the government, the police, custom-house officers, persons employed in military works or in the supply of the troops, and aliens. The number of males belonging to the troops quartered there is 1,155.

“I have no means of calculating accurately the native population within the same district but those

in immediate contact with the Europeans at Wellington, Taranaki, and Wanganui alone amount to about 7,000 souls, and I do not think that the whole of the native population in the district named can be taken at less than 25,000 souls.

“The result, therefore, for the northern island of New Zealand would stand as follows:—

Adult Males.		Natives.
Civil.	Military.	
1,500	1,703	80,000
1,657	1,155	25,000
3,157	2,948	105,000

And this does not include the naval force. Owing to the paucity of women and children amongst the natives, the number of males capable of bearing arms forms a very large proportion of the above stated native population.”

In a subsequent despatch, dated July, 1849, the Governor describes the New Zealand colony as consisting of nine principal European settlements, besides smaller dependencies of these, scattered over a distance of about 800 miles of latitude, separated from each other by wide intervals; only three of

them having inland communication with each other, even by persons on horseback. The total number of white colonists he states at 20,000 who were chiefly British subjects; but there were many Americans, French, and Germans. The majority are without arms, have never been trained to their use, and they are so scattered that they could not combine for their mutual assistance; and owing to the irregular manner in which they have occupied the country, it would be found impossible for the government to afford them efficient protection. The wide intervals between these European settlements are occupied by the Maories, or native races,* whose numbers are estimated at 120,000, a very large proportion of whom are males, and, to a great extent, armed with rifles, or double-barrelled guns, in whose use they are well skilled, and who have shown themselves, in repeated encounters with some of our best regiments of the line, equal in tactics and in bravery to any European troops. They are such excellent strategists that our soldiers have never yet succeeded in bringing them to a decisive encounter; availing themselves of the advantages afforded by their wilds and fastnesses, moving independent of baggage or supplies, and subsisting on fern-root, or on potatoes, carried by their wives, they can move and act where our troops could not live, and at any moment they could disarm every European in New Zealand.

Sir George Grey adds,—

"There appears to be no analogy between the irregular manner in which these islands were partially peopled by whalers and persons from all portions of the globe, and the pilgrim fathers who founded the early settlements in America. And I have been assured by many excellent and experienced officers, well acquainted with America and this country, that there is, in a military point of

* This estimate being higher than that given elsewhere, is adduced by Mr. Shortland in his recent work, to combat the general opinion that the Maori population is decreasing. He argues at considerable length, that the cessation of internecine strife, which occasioned much bloodshed, and reduced large numbers to slavery, had materially checked a diminution which was otherwise inevitable—that a greater feeling of security has caused them to quit their fortified and isolated paha, and dwell in scattered villages, which has given rise to the idea of depopulation—that no reliance can be placed on their own vague statements as to their number in past times, exaggeration being a marked feature in their character. That there is no proof, whatever, of the Maori having in migrating from a warm climate, brought with him the habits of the tropics, and so generated an unsound constitution, but that on the

view, no analogy at all between the natives of the two countries; the Maories, both in weapons and knowledge of the art of war, a skill in planning and perseverance in carrying out the operations of a lengthened campaign, being infinitely superior to the American Indians. In fact, there can be no doubt that they are, for warfare in this country, even better equipped than our own troops.

"These natives, from the positions which they occupy between all the settlements, can choose their own point of attack, and might even so mislead the most wary government as to their intended operations as to render it extremely difficult to tell at what point they intended to strike a blow. They can move their forces with rapidity and secrecy from one point of the country to another; whilst, from the total absence of roads, the impassable nature of the country, and the utter want of supplies, it is impossible to move a European force more than a few miles into the interior from any settlement.

"The natives, moreover, present no point at which they can be attacked, or against which operations can be carried on. Finding now that we can readily destroy their paha or fortifications, they no longer construct them, but live in scattered villages, round which they have their cultivations, and these they can abandon without difficulty or serious loss, being readily received and fed by any friendly tribe to whom they may repair. They thus present no vulnerable point. Amongst them are large numbers of lawless spirits, who are too ready, for the sake of excitement and the hope of plunder, to follow any predatory chief. To assist in anything which might be regarded as a national war, there can be little doubt that almost every village would pour forth its chiefs and its population.

"With these characteristics of courage and warlike vagrancy, the Maories present, however, other remarkable traits of character. Nearly the whole nation has now been converted to Christianity. They are fond of agriculture, take great pleasure in cattle and horses; like the sea, and form good sailors; are attached to Europeans, admire their customs and manners; are extremely ambitious of rising in civilization, and of becoming skilled in European arts; they are apt at learning; in many respects extremely conscientious and observant of their word; are ambitious of honours, and are probably the most covetous race in the world. They are also agreeable in manners, and attachments of a lasting character readily and frequently spring up between them and the Europeans."

contrary, Cook considered them a peculiarly healthy and vigorous race, that it seems doubtful if strumous complaints (consumption, scrofula, &c.) are so prevalent among them as in Britain, and that the introduction of Christianity has mitigated the rigorous labour to which women were subjected, has stopped cannibalism, infanticide, abortion, and other crimes, promoted monogamy, diminished feuds and ancient animosities, and given a new and peaceful direction to the thoughts and energies of a brave, active, and enterprising people.

"There is then, it is believed," he goes on to say, "no sufficient reason to anticipate the extinction of the Maori race, except by the possible means of its becoming blended with the European stock, an event the accomplishment of which must be very remote under any circumstances."—*Southern Districts of New Zealand*; chapter iii.

The subjoined statement of the native population is the only detailed estimate yet published, I therefore give it, although it is evidently grounded on very vague data. The spelling adopted by Mr. Halswell is so different from that used by other authorities, that I have altered it in several places, lest it should be unintelligible:—

* There has invariably been a difference manifested in New Zealand, as among ancient nations, between slaves in our sense of the word and captives. Both were employed in services more or less degrading to a "rangatira," but the born freeman, when captured was treated with more consideration, though his life was quite as much at the disposal of his master as that of a born slave. Among the slave class the fortune of war has sometimes included some of the highest chiefs and finest looking men and women in the country, and on the other hand individuals

The following statement shows the numbers and condition of the natives of Wellington, Waikanae, Otaki, Manawatu, Rangitiki, and Wairarapa, in 1849, compiled by the Native Secretary to government:—

Population:—Male adults, 2,053; female ditto, 1,596; male children, 566; female ditto, 496; grand total, 4,711. Religion:—Church of England, 2,260; Wesleyans, 534; Roman catholics, 161; grand total, 2,955. Moral condition:—Married according to Europeans, 121; ditto native custom, 968; can read and write, 1,148; can read only, 414; daily scholars, 283.—Churches or chapels, 39, weather boarded houses, 29; huts, 1,102; horses, 349; cattle, 262; sheep, 42; wheat, 240 acres; maize, 235 acres; potatoes, 648 acres; kumera, 78 acres; other garden produce, 67 acres; tame pigs, 2,690; goats, 127; vessels, 2; war canoes, 130; water mills, 3; carts, 8.

The natives within the above mentioned districts are in the receipt of rents to the amount of £802 8s. per annum. The quantity of flax prepared by them averages 120 tons per annum, which is sold at the rate of about £10 per ton.

Among the aborigines there appear to have been originally at least two races, marked by distinctive characteristics, one composing the class of chiefs, (rangatira, or gentlemen,) the other an inferior variety of race, which has gradually become more or less enslaved; for slavery, though in a very mild form, was, until the introduction of Christianity, general throughout New Zealand.* The superior class are of a light brown or olive hue, and lofty stature; their features handsome and intellectual, notwithstanding the custom of *tattooing*† them; and the natural dignity of their bearing so striking, as to have induced more than one traveller to compare a Maori chief, wrapped in the ample folds of his red blanket, to a Roman senator in his toga. In the other class, traces of a negro cast of features, and a darker shade of colour, are observable; and the curly, black hair, rather short, thick-set frame, and inferior expression of countenance, seem to indicate difference of race, much modified, however, by frequent intermarriage and changes of position. In New Zealand, females hold

notably inferior in personal appearance may be found among the ruling chiefs.

† The *tattooing* or *tattooing*, when well done, is said to have an effect by no means unpleasant to the eye, after a short time. The Maories say it makes the young men look like warriors, and the old appear young; this is so far true that it forms an unchanging mask. The young women, when first urged by the missionaries to leave off so barbarous a custom, replied, "we must have a few lines, particularly on the lips, just to keep away wrinkles."

property in their own right, and raise their husbands nearly to their own station, a fact which has been too little regarded in examining the claims of the early settlers.

The Maori women, when young, frequently possess considerable symmetry of form; their dark, bright, restless eyes are very fascinating; their teeth regular, and as white as ivory; and their soft voices give a peculiar sweetness and pathos to the musical idiom of their native tongue, which closely resembles that of the Sandwich Islands, and also that of Tahiti. Respecting the character of this singular and deeply interesting people much has been written of late years. Captain Cook's account, though necessarily cursory and imperfect, from his limited communication with them, is invaluable as our only record of their habits and manners, as a heathen nation, while yet unchanged by communication with Europeans. He says, that "the dispositions of both men and women seemed to be mild and gentle; they treat each other with the tenderest affection, but are implacable towards their enemies." Abundant testimony from various witnesses has confirmed the correctness of this remark; nor is it a slight evidence in their favour, that those who have known them best and longest, have esteemed them most. Bishop Selwyn, Archdeacons William and Henry Williams, and, in fact, the whole clerical and missionary body, have been included in one sweeping censure as prejudiced witnesses: yet their conclusions, grounded upon personal experience, are fully borne out by those of Governors Hobson, Fitz-Roy, Grey, and of the good and able Judge Martin. Captain Fitz-Roy speaks of the strict sense of honour which distinguishes their intercourse with their families and friends, of their unbounded hospitality, and of the purity of their hearth, (crimes against which were punished with death, after a kind of trial by jury,) as reminding him of the leading characteristics of the Araucanian Indian, as well as of the Arab of the desert, from whom the New Zealander, or rather the Polynesians in general, may be descended, and that they may be classed among the numerous children, or posterity, of Ishmael, whose hand, according to prophecy, should be against every man, and every man's hand against them!

In war, the Maori, throwing aside all gentler feeling, gives the rein to every bad passion of the unregenerate man; he be-

comes bloodthirsty, treacherous, and revengeful, though, even then, he never appears to exhibit the diabolical and systematic cruelty exercised among many savage nations. He kills, but rarely tortures. The *haka*, or war-dance, performed previous to hostile onsets, to which the trembling wives of the early missionaries so often listened in speechless horror, while their husbands strove, at the risk of their lives, to mediate between the opponents, is described as something terribly appalling; the ferocious shouts and serpent-like hissing seeming to express an energy of hate and evil truly demoniacal. Their demonstrations of grief for the dead, of anguish at parting, of joy at meeting, are scarcely less vivid; but probably they indicate, like other paroxysms, a brief duration of the feeling thus expressed. The New Zealanders are, however, beyond question, faithful and affectionate; they are devotedly attached to their own offspring, and both fond and proud of the European children. The native women married by the whalers, sealers, and some of the lower class of settlers, have made good wives; but the difficulty of acquiring the Maori language, and the far greater difficulty of their learning English, is an obstacle to the happiness of these unions.

The Maori character, like that of many other nations, both civilized and savage, presents some strange contrarieties. Honest and trustworthy—true to the letter and spirit of their plighted faith—many of them are given to lying, from the mere habit of freely indulging the vagaries of a romantic imagination. They enjoy gossip, and invent stories when they have no news to tell; they love the marvellous, and exaggerate greatly. Shrewd traders, and well aware of the value of money, they are naturally generous, and cannot be prevented from lavishing on some newly-arrived relation or friend the whole of their hard earnings. Their poetry, many short pieces of which have been translated by Dieffenbach, Joplin, Merrett, Davis, and others, would in itself form an extraordinary feature in the history of any uncivilized people; and it is to be regretted that more care has not been taken to become still better acquainted with it, ere it pass away with the generation through whom some portions of it might be perpetuated. Of the various customs and manners—of the carvings and habitations—of the dress and implements of war—of the tattooed and preserved heads—and, above

all, of the wild, fanciful, and gloomy, but not idolatrous superstitions of the New Zealanders, in their heathen state, so much information has been circulated in England of late years,* that it is scarcely necessary to allude to them, save as relics of a by-gone era.

New Zealand is now becoming a Christian nation, and we may reasonably anticipate great things of her children. It must not be overlooked, even in this hasty sketch, that she has already produced men and women who, if their characters were correctly delineated, and their history faithfully recorded, might take rank as great men. True it is, we can do little more than conjecture the motives of those daring adventurers who, migrating hither from some of the Polynesian islands, have been the founders of a race who, physically and morally, have few equals among aboriginal tribes, and whose daring determination in defending their territorial rights has not been more conspicuous than their keen appreciation of the benefits resulting from the arts of peace, and their almost general admittance, if not reception, of the truths and doctrines of the Christian faith.

The spirit that actuated Peter the Great, in laying aside his sceptre to labour with his hands in the dock-yards of England, was it not the same that induced Duaterra to break the chain of prejudice and custom, and labour in the lowest and most laborious agricultural employments, that he might instruct his countrymen in those useful pursuits, which he felt to be essential to their progress. Did ever far-seeing statesman meditate more anxiously the consequences that might result from his conduct in some trying emergency, than this same New Zealand chief, when, after agreeing to receive and protect the early ministers of religion and civilization, a whispered warning led him to reflect on the condition of the aborigines of Australia and Van Diemen's Island, and hesitate to introduce into his own beloved country, European settlers, under any guise or pretext.† (*Vide* p. 122.)

Te Pehi, or Tippahee, the great chief who visited England, won for himself and his people no small popularity. (p. 116.)

E'Onghi, and the blind wife who accom-

panied him in all his campaigns—does he bear no resemblance to other conquerors? saving, of course, the fearful stain of cannibalism, which has thrown a deep veil of horror and disgust over exploits, which those who delight in war might otherwise have deemed glorious,—so ambitious were his projects, so daring their execution. (p. 123.)

George, the inciter of the fearful Boyd massacre, was a bold, bad man, but his worst passions had been roused by the injuries and insults heaped upon him by Captain Thompson and his ill-fated crew; and, even in the midst of the frightful carnage, he shewed a touch of grateful feeling, by protecting the cabin-boy, who had shewn him kindness during the period of degradation which he so fearfully avenged. (p. 118.) Subsequently, Mr. Marsden, when engaged in establishing the earliest mission in New Zealand, proved his confidence in the inviolable hospitality of even the most ruthless of Maori chiefs, by sleeping by his side, surrounded by the fiercest warriors of the tribe.

To come to more recent times, Te Whero-Whero, and the brothers Patuone and Walker Nene, are men, whose natural ability, honesty, and steadfastness of purpose, successive governors of New Zealand have scarcely known how to praise sufficiently. Heke and Kawiti must be acknowledged by every one, who has studied the events of 1844-5, to have been skilful warriors, even military tacticians; certainly, they were far from being bloodthirsty savages. The wife of Heke, the daughter of E'Onghi, was a very remarkable woman, and the principal adviser of Heke throughout his warfare. Ranghiaiaata, appears to have been crafty and sanguinary, but both he and Te Rauperaha (by far the superior of the two), cannot be considered as otherwise than men of considerable ability, and conduct in war. Who can read, without emotion, the consistent conduct of Puaha, the Christian chief, whose deep forebodings of the consequences that would result from the perseverance of the Nelson party, in their illegal attempt to seize the persons of the Maori chiefs, while defending their own property, powerfully impressed the mind of Captain

* *Vide* Angus' *Savage Life and Scenes*, Dieffenbach's *New Zealand*, Polack, and others.

† At the close of his eventful life, Duaterra was only eight-and-twenty. It pleased God to summon him at the very moment when his brightest anticipa-

tions seemed about to be realized, and his zealous efforts crowned with success.—(*Vide* an interesting memoir drawn up by the Rev. S. Marsden, and published in the appendix to Nicholas' *Voyage to New Zealand*.)

Wakefield; and whose solemn entreaties, but for the hasty violence of Mr. Thompson, the police magistrate, might, up to the very moment when the firing commenced, have stayed the effusion of blood, and saved the valuable lives so recklessly sacrificed at the Wairau. (p. 202.) Lest, however, I should seem to have formed too favourable an opinion of the Maories, I subjoin the following remarks, penned by one who having become acquainted with them in war time, and, as an enemy—yet, generously acknowledges their claims to respect:—

“The Maori is not a whit inferior in intelligence—is perhaps even superior in natural acuteness—to the uneducated classes of Europeans. Many individuals among them are possessed of superior understanding, and considerable information; and even the old men can sufficiently appreciate the advantages of education to begin their schooling long after time has grizzled their locks. An instance of an European perfectly uneducated to the age of fifty, and who then begins to acquire a knowledge of reading and writing, is considered remarkable; it is by no means so among the Maories. They pay as much attention to the improved cultivation of their lands as to that of their minds; European spades and mattocks take the place of their own rude implements; grain is everywhere superseding the potato. Sheep and cattle are added to their stock; fair wages purchase fair labour, and they put money in the bank. These are men who have some stake in the country, who can understand clearly when they are oppressed or injured, and who can resent it fearlessly. . . . The story of the natives of New South Wales and of Van Diemen's Land is well known to them, and they dread similar consequences to themselves, though with a steady determination to meet them with stout resistance.”—Power; pp, 156, 157.

Among other measures adopted for the benefit of the natives, by her Majesty's government, may be mentioned, the prohibition of the sale of spirituous liquors to them, of arms, of gunpowder, or even the repair of arms; providing the means of educating a number of native children; the establishment of hospitals, where they are treated on the same footing as Europeans; a tolerably efficient medical attendance in the most populous native districts; the employment of a native constabulary force; the enactment of laws for the adjustment of all disputes between the aborigines and Europeans; the issue of a weekly newspaper in the Maori language, wherein all measures of the government are explained to them, and its columns open to them for complaint; the training of the natives in various kinds of skilled labour on public works, under the superintendence of the royal engineer department; the for-

mation of roads, and opening up of large tracts of country; the establishment of savings' banks; and government advances of small sums to different chiefs, to enable them to buy and build small sailing vessels for fishing and coasting traffic. This last admirable measure was introduced by Governor Fitz-Roy, although—cruelly fettered by the hopeless state of bankruptcy in which he found the colonial treasury, he had no pecuniary means of benefitting the natives, save from his private purse. The advances made have been punctually repaid, and the result of this wise and kindly policy is seen in the establishment of an extensive coasting trade, carried on chiefly by the natives.

Some important privileges remain to be conceded them; viz., that they should have a voice in the legislature, and be selected, if duly fitted by character and education, as salaried functionaries of the government, equally with British subjects of European descent. To exclude them from the elective franchise solely on the ground of their ignorance of a most difficult language, which Bishop Selwyn declares to be next to impossible for them to acquire, is an injustice which cannot be too soon rectified.

Their territorial rights have been fully recognised: in 1848, the few resident natives were treated with for the cession of certain extensive portions of the Middle Island, for which the sum of £2,000 was paid to them, and extensive reserves set apart for their sole use and benefit. The resident natives of the southern extremity of the Middle Island (about 280 individuals), have offered to sell to the government all that remains to them, including the whole country between Otago and Foveaux Strait, and Captain Stokes considers they would do so for £2,000 purchase-money.

In various places, the natives are leasing their reserves to European stockholders and agriculturists; from the Valley of the Wairarapa, they derive upwards of £1,000 per annum, and at Nelson and elsewhere, their rentals are improving, and will ultimately prove very lucrative. Of their own progress in mechanical, agricultural, and pastoral pursuits, many illustrations have been given in the preceding chapter. The more recent despatches of Governor Grey, and also the minutes of Lieutenant-governor Eyre respecting them, seem to indicate that, to energy and ability, they are gradually adding the habits of steady in-

dustry, which affords the best guarantee for their continuous progression as a civilized people.

The following testimony, borne by the governor in 1850, after an extensive tour, is highly creditable to the Maories, and proves that the missionaries, in their zeal for their spiritual welfare, have laboured also to improve their temporal condition :—

" I visited the districts of the Thames, of Rotorua, of Taupo, of Waipa, and of the whole west coast lying between Kawhia, and this place. Throughout the whole of these extensive and remote districts, I found the natives warmly attached to the British government, and anxious in every manner to testify their loyalty and attachment to the British crown.

" 2. I am also happy to be able to state that I found them in all places pursuing improved modes of agriculture, and making preparations for the erection of water mills, or for other improvements. It was necessary for me to visit many mission stations, and I, in all instances, found the missionaries actively superintending and promoting the various improvements, in which the natives were engaged, so that the residence of these gentlemen in the districts I have visited, is conferring an advantage which cannot be overvalued, upon the present inhabitants of these islands, and upon the future occupants of them."

RELIGION.—Too little regard has been shown by the government, and utter indifference has been manifested by the New Zealand Company, to the making due provision for the administration of the ordinances of Christianity. There are no livings, rectories, or glebes throughout New Zealand. The only expense borne by the state, in the province of New Ulster, is—at Auckland, the salary of one chaplain (£200); and the whole ecclesiastical cost of the New Munster Province, for five settlements, was, for the year 1848, only £133 6s. 8d. Even in May, 1849, Lieutenant-governor Eyre, addressing the Legislative Council at Wellington, expressed deep regret that the province of New Munster should so long have laboured under a deficiency of ministers of religion, and of the means of Christian education. Until recently there was only one clergyman to attend to the spiritual care of 4,500 persons, spread over an extent of nine miles—to officiate at four places of worship, distant one, five, and nine miles from each other—to visit the hospital and jail, and succour the poor and afflicted. For several successive sabbaths in 1848-9 there was not an officiating clergyman of the church of England in Wellington. To remedy this grievous defect the Lieut.-governor appointed a colonial chaplain, as the New Zealand Company ought to have done years before.

In 1848 the religious persuasions in New Munster were—

Denominations.	Wellington	Nelson.	Akaroa.	Otago.
Church of England .	2,668	1,480	92	168
Wesleyan	726	468	12	19
Other Dissenters ¹ .	1,088	769	87	275
Roman Catholics . .	262	187	69	19
Non Sectarian ² . .	71	166	5	4
Hebrew	28	—	—	—

¹ Include the Established and Free Churches of Scotland (of which no separate census had been taken in 1848), the Cameronian, Primitive Methodists, German Lutherans, and the English and Scotch Independents.

² Professing to belong to no religious sect.

The number of places of worship were, church of England, 9; church of Scotland, 1; Wesleyan, 7; other dissenters, 7; Roman Catholic, 3. The experiment of founding settlements exclusively of one religious persuasion has in the instance of Otago been manifestly a failure; this settlement was to consist solely of the free church of Scotland, and an endowment of £300 a year for a minister was created; yet in 1848 there were 276 persons of five different persuasions, including that of the free church of Scotland, and 206 of the church of England, church of Rome, and Wesleyan persuasion.

The places of worship in New Ulster, in 1849, were in Auckland District 8, with 6 clergymen; Bay of Islands 4, with 6 clergymen; Wesleyan 6, with 6 clergymen; Presbyterian 1, Roman Catholic 1.

The clergymen of the church of England are not paid by the government, but by the Church Missionary Society; the bishop receives a small sum from government, and the remainder of his stipend is also furnished by the same beneficent association.*

In the Maori villages there is generally a building of a larger size than the dwelling houses of the people, set apart for Divine worship, and although these are for the most part rude structures, compared with the costly edifices of stone or brick raised by civilized man, they are marked by the pleasing feature of being the best buildings in the place. It is calculated that of those natives who are in connection with the Church Mission there are about 46,000 regular attendants on the religious services, while the communicants are above 6,000.

* Report of Church Missionary Society; 1849 p. 204.

The subjoined statements of the present conditions of the New Zealand Missions have been furnished me by the courtesy of their respective secretaries:—

Church Missionary Society in New Zealand, 30th April, 1850.

The gradual increase of the native communicants of the eastern district is very remarkable: it is thus shown in the report of Archdeacon W. Williams for the year 1849:—In the year 1840, the number was 29; 1841, 133; 1842, 451; 1843, 675; 1844, 946; 1845, 1,484; 1846, 1,668; 1847, 1,960; 1848, 2,054; 1849, 2,893.

The Wesleyan Mission—now enumerates sixteen principal stations, the chief establishments of which are situated at Auckland, Manukau, Mangungu, Waima, Wairoa, Kawhia, Aotea, New Plymouth, Waingarua, Waipa, Waimate, Waitotara, Wanganui, Port Nicholson, Nelson, and Waikowaiti. Upon, or in connection with these stations, 104 chapels, and 129 other places of worship have been erected; and the number of missionaries is now twenty. Upwards of 3,000 native communicants, whose altered conduct furnishes proof that they have imbibed the spirit, as well as assumed the profession of Christianity, are, together with more than 500 of their white brethren, recognised as fully accredited church members. Many native teachers have been raised up, who are zealously engaged, under the direction of the missionaries, in teaching their ignorant fellow countrymen. Of these native agents, 325 act as local preachers or exhorters, 390 as sabbath school teachers, while seven assist in conducting day schools. An institution for training native teachers is in successful operation. 110 day schools have been instituted, in 105 of which, 3,413 natives, adults, and children, are receiving the advantages of religious and general education; and five day schools are conducted for the benefit of the children of the colonists, in which 236 children are receiving instruction: 207 sabbath schools, attended by upwards of 7,000 scholars of both sexes, afford religious instruction to both adults and children, the native race, and to the colonial youth on the Lord's day. A printing press has been several years at work, at the principal station on the Hokianga, in printing books in the native language, to meet the spirit of enquiry which has been excited among the people.

The British and Foreign Bible Society has printed in the Maori language—of the New Testament, 60,900 copies; Testaments and Psalms, 20,200. Portions of the Old Testament, 10,120 = 91,220; about 80,000 of these copies have been granted to the Church and Wesleyan Missionary Societies, for the use of the New Zealanders.

Numerous copies of the New Testament and of the Liturgy of the Church of England have been printed in the Maori language, and many more are urgently required.

The Roman Catholic mission to New Zealand was founded in 1838, when Monseigneur Pompallier, the bishop, arrived with a priest and catechist. In 1846 there were two Roman Catholic bishops, sixteen priests, and eight friars distributed over the islands. Of the number of converts I am unable to offer an estimate.

The conversion of the Maories to Christianity is the only modern instance of an entire race of heathens, sunk in the depths of sin and degradation, being converted, within the period of a single generation, to the worship of the one true God. Did space afford the narration of the blessed effects of missionary efforts through the abounding grace of the Spirit, many special instances would seem little short of miracles. Governor Grey states that the whole native population are now Christians; and in the cessation of polygamy and infanticide, in the abandonment of their heathen superstitions, in their daily study of the scriptures, in their assembling regularly every morning and evening for public worship in each village before and after labour, in their studious observance of the Sabbath as a holy day, and in their erection of numerous temples of worship, unmistakable evidence is afforded how well they merit this distinctive and ennobling appellation.

EDUCATION.—According to the census of 1848, there were in New Munster—*Private* schools, 13, with 251 males, and 142 female pupils. *Public* schools—Church of England day schools, 7; scholars, 235 males, 159 females; ditto, Sunday, 6 scholars, 182 males, 138 females. Scotch Presbyterian day school, 1; scholars, 22 males, 26 females; Sunday, 2; scholars, 47 males, 51 females.

340 STATISTICS OF EDUCATION AND CRIME IN NEW ZEALAND.

Wesleyan day schools, 4; scholars, 188 males, 124 females; Sunday, 4; scholars, 33 males, 34 females. Roman Catholic school, 1; scholars, 39 males, 5 females. Dissenters generally, day schools, 5; scholars, 83 males, 48 females; Sunday, 4. Non-sectarian day schools, 11; scholars, 115 males, 109 females; Sunday, 8; scholars, 195 males, 220 females.

This return does not include Maori or

regimental schools. It appears that of the European population, 1,286 males and 1,234 females could *not* read in 1848. Those who could read only, were in number 875 males, 862 females: those who could read and write were 2,602 males, 1,664 females. The total number receiving daily education was 1,709.

The state of the schools in New Munster, 1849, was—

Districts.	Schools.	Scholars.		Total.
		Males.	Females.	
Wellington	3 public day	108	69	177
"	12 private day	287	98	385
"	7 Sunday, for Europeans	90	46	136
"	2 " for Maories	35	30	65
Wanganui	1 public day	23	19	48
Nelson	13 "	289	241	530
"	14 Sunday, for Europeans	360	316	676
Otago	1 "	16	18	34
"	1 public day	36	34	70
Total receiving instruction in 54 schools		1,250	871	2,121

The state of education in New Ulster, during 1849, was—in Auckland District, *Church of England*, 7 schools, with 122 male, and 84 female scholars; Roman Catholic, 7 schools, with 340 male, and 286 female scholars; *Wesleyan*, 2 schools, with 270 children, and 1 native school. In the other districts of the province of New Ulster there are 11 schools, with 16 European and 965 Maori children; and 1 school at Aotea has 750 scholars, marked as attending instruction there.

Some of these schools are merely educational; others combine industrial pursuits, with elementary instruction. At many of the native schools the pupils are boarded, and raise much of their own food. The contributions from the public revenue of New Ulster, in 1849, towards industrial and common education, was—to the Church of England schools, £1,225; Wesleyan Mission, £873; Roman Catholic Mission, £405.

The Press.—Auckland, Wellington, Nelson, and Otago, have each one or more newspapers in the English language. The government, in 1842, established, at the suggestion of Mr. George Clarke, then protector of aborigines, a *Gazette* in the Maori language, with English letters, the Maories having no alphabetic or phonetic characters of their own. This useful periodical was set aside by Governor Grey, in 1846, but has been lately re-established. By its means the aborigines are kept constantly ac-

quainted with the measures of government with respect to them, and with the reasons for their adoption. Interesting information is also furnished, and the *Gazette* is read with avidity, and its news discussed by village politicians with freedom and public spirit.

CRIME.—The number of convictions before the Supreme Court in New Munster, for five years, ending in 1848, was—

Offences.	Wellington.	Nelson.
Against the person	17	2
" property	35	6
Miscellaneous	8	—
Total	60	8

The murders were, in number, 2—man-slaughters, 3; wounding, with intent to kill, 1; burglaries, 8; rape, 2. Of the 61 prisoners convicted, 20 consisted of persons who had arrived from New South Wales, Van Diemen's Island, or Parkhurst prison in England; 19 were soldiers; 10 were sailors, or unknown; 10 were original settlers; and 2 were Maories.

The total number of persons committed to prison in the Auckland District, in 1849—of whites, 112 males, 36 females; coloured, 9 males, 1 female = 158. At New Plymouth, 7 whites, and 1 coloured.

GOVERNMENT.—The mode in which the executive and legislative affairs of New Zealand were administered at the period of the

formation of the colony, has already been described, (p. 143,) as also the changes proposed in 1846, by an act of the Imperial Parliament—the repeal of that act, and the present form of administration, (pp. 231—235.) In 1852, a new constitution will be formed for New Zealand.

There is no local government at Nelson, New Plymouth, Otago, or Canterbury; and there are no municipalities there. The governor at Auckland appoints a magistrate and collector of customs for each settlement. Unpaid magistrates, sufficient to form a bench, are nominated from among the resident inhabitants; and the puisne judge at Wellington makes circuits when necessary. There is a chief justice and a Supreme Court of Judicature at Auckland.

MILITARY DEFENCES.—The number of troops stationed in New Zealand since the commencement of the administration of Governor Grey, has varied from 2,000 to 3,000. At present there are about 1,500 men, composed of royal artillery, engineers, and troops of the line, all under the authority of a major-general. There is also a local corps, termed the "Royal New Zealand Fencibles," composed of military pensioners who have been sent out with their wives and families as emigrants, and located in different districts.

The tabular statistics of the first, second, third, fourth, fifth, and sixth divisions of pensioners enrolled for service in New Zealand on the 1st of December, 1849, are as follows:—

No. of Division and Name of Village.	Date of Arrival in the Colony.	Miles distant from Auckland.	No. of Men who arrived in Colony.	Acre lots given to each Division.	Advance for Stock, &c.	Cottages complete and occupied.	Cottages in progress.	Horned Cattle owned by pensioners	No. of Women, Pensioners' Wives.
1 Onehunga	Aug. 5, 1847	6	67	63	—	64	—	36	54
2 Howick.	Oct. 8, "	13	76	76	£275	25	44	49	69
3 "	Oct. 10, "	13	66	66	192	50	12	47	60
4 "	Nov. 26, "	13	77	75	200	50	11	23	58
5 Panmure	Jan. 23, 1848	8½	75	75	192	70	6	—	57
6 Otahuhu	May 15, "	8¼	73	73	—	25	4	16	68

Note.—In addition to horned cattle, the first division possess three horses.—The twenty-five cottages returned as incomplete in the sixth division are incomplete, and given over.—The four cottages, in the same division, returned as in progress, comprise two sergeants' and two privates' cottages.

Subsequently to the date of this return a much greater quantity of Pre-emption Land has been applied for than had been previously.

A Maori militia has been commenced: in April, 1849, arrangements were entered into between Governor Grey and nine chiefs of Te Whero-whero's tribe, by which themselves, and seventy-two of their followers, were permitted to occupy government lands in the neighbourhood of one of the European pensioners' (New Zealand Fencibles) villages, about six miles from Auckland.*

* Each of eighty-two Maories are to occupy six acres of government land rent free, subject to the condition of their serving, armed at their own expense, under the command of an officer of the Pensioners, whenever they may be called out for drill or military service by the government. For the first twelve days of such drill or service, they are to receive no payment, but for any number of days not exceeding twelve in the year, "they are to receive 1s. 6d. per diem. It is contemplated at the end of seven years to make over to the well conducted their lands and houses as freeholds. They are brought under the supervision of a British military officer and of a very active and energetic clergyman; and 'their first care in selecting the land for their occupation, was to examine every part with the object of ascertaining and reserving the best site for a church and a place for the clergyman's residence;' the surveyor-general adds 'in the choice of these places they displayed more taste and judgment than could have been expected.'"—En-

Under a militia ordinance dated 25th March, 1845, there is in New Ulster an Auckland battalion, consisting of 20 officers and 976 rank and file: there is also a militia battalion at Wellington and at Nelson.

There are two militia battalions in New Munster, one for Wellington, the other for Nelson. The period for drilling is twenty days in each year.

closure in Despatch from Governor Grey to Earl Grey, dated 22nd June, 1849. In honour of their sovereign they unanimously named their location "*Queen's Town*." On signing the agreement the Maories stipulated that their native teacher, who, in the absence of the minister, read prayers, be exempted from military duties. Governor Grey intended to extend the number of these militia villages, so that in the event of renewed disturbances each division of the European New Zealand Fencibles would have the co-operation of a well drilled native militia, serving under the same officers, and whose activity and knowledge of the country would compensate for the unfitness of the Pensioners for rapid movements. By settling the Maories in fertile and favourable localities where they would find a ready market for their produce, an increasing value would, it was considered, be given to their property, and an intimacy spring up between them and their European neighbours, by which an attachment to British interests might be created.

CHAPTER V.

REVENUE—CUSTOM DUTIES AND OTHER ITEMS OF TAXATION—CIVIL AND MILITARY
EXPENDITURE—BANKS AND MONEYS—COMMERCE—EXPORTS—STAPLE PRODUCTS
—SHIPPING—WAGES OF LABOUR, AND PRICES OF PROVISIONS.

THE colony of New Zealand is unable, from its local revenue, to defray even its civil expenditure. In the New Zealand Company's settlements, throughout New Munster province, the revenue received in each successive year from 1840 to 1848, was:—£836, £4,425, £13,154, £12,592, £8,602, £6,341, £9,098, £15,515, £16,376. Meanwhile, the local expenditure increased from £1,550 to £69,861: this large sum being expended in the civil government of settlements containing less than 9,000 settlers. When to this we add the enormous charge for military expenses, it can scarcely be wondered that her Majesty's ministers should discourage the formation of colonies

on the so-called "self-supporting principle," when experience proves them to be so heavy and continuous a drain on the British exchequer; and yet ill adapted, with all the help that "puffing" and extensive publicity can give them, to attract the tide of emigration from countries where *cheap land* affords the best prospect of independence to the needy, but industrious and enterprising adventurer.

It is difficult to form an accurate statement of the revenue and expenditure of New Zealand as a British colony. The following table, framed from various documents, is therefore only approximative, the total outlay is about £250,000 a year:—

Year.	Revenue.			Parliamentary grant, or receipts in aid of revenue.	Appropriation from the commissariat chest for military and naval.	Total expenditure derived from local revenues, parliamentary grants, &c., and commissariat chest.
	From Customs, &c.	From land sales, &c. ¹	Total.			
1840 ^a	£926	—	£926	£43,347 ^a	£804	£72,419
1841	8,802	£28,540	37,342			
1842	20,282	11,723	32,005	17,494	1,426	50,925
1843	19,787 ^a	1,613	20,400	9,562 ^a	8,093	38,055
1844	13,756	405	14,161	2,532 ^a	9,782	26,475
1845	38,029	615	39,554	35,673	—	—
1846						
1847	42,430	835	43,365	37,752	153,038	234,155
1848	41,856	3,337	45,193	50,250	155,653	251,096
1849	44,940	3,600	48,540	33,000 ^a	151,455	232,995
1850	—	—	—	—	—	—

¹ The fees on land grants not included, as they belong to the general revenue department.—^a From the period of the assumption of British sovereignty in the early part of 1840.—^b This sum was advanced by the government of New South Wales from the taxes levied on the people of that colony, and has not yet, I believe, been repaid by New Zealand or by the British Treasury.—^c Of this £4,286 were arrears.—^d This includes £3,562, amount of bills drawn on the British Treasury, £5,000 drafts on Boyd and Robinson, of Sydney, and £1,000 a loan from the Bishop of New Zealand.—^e In addition to this £18,383 were issued as colonial debentures.—^f No blue book sent home for 1845-6.—^g Of this sum I am not certain, as moneys have been drawn from the commissariat chest in the colony, irrespective of the sums voted by parliament.

Custom duties form the principal source of revenue: they were suspended by Governor Fitz-Roy, 30th September, 1844, and re-established by Governor Grey in April and May, 1845. The sums collected since 1841 are thus imperfectly shown:—

Year.	Auckland.	Wellington.	Russell.	Nelson.	New Plymouth.	Akaroa.	Otago.	Total.
1841	£2,251	£2,829	£1,194	—	—	—	—	£6,274
1842	5,524	8,983	2,573	£1,335	£170	—	—	18,588
1843	4,047	6,534	1,904	3,069	467	£182	—	16,206
1844	3,069	4,604	1,051	1,972	481	246	—	11,426
1845	4,875	3,689	—	739	36	—	—	9,348
1846	—	6,368	—	1,070	—	—	—	—
1847	11,155	13,138	—	1,361	—	—	—	22,654
1848	17,970	11,020	—	1,571	—	—	824	31,385
1849	18,618	15,764	—	2,068	—	—	1,159	38,409
1850	—	—	—	—	—	—	—	—

The total civil and military revenue and expenditure in the years 1848-9, was:—

Districts.	1848.	1849.
Revenue:—		
New Ulster	£25,561	£25,687
New Munster	18,669	23,066
Total revenue	44,230	48,753
Civil Expenditure:—		
New Ulster	47,427	41,205
New Munster	40,300	39,054
Total civil expenditure	87,727	80,259*
Military Expenditure:—		
New Ulster	100,132	90,359
New Munster	55,521	61,096
Total military expenditure	155,653	151,455
Ditto civil	87,727	80,259
Grand total	243,480	231,714

The military charges are exclusive of the cost of conveying troops, of pensioners, and other charges incurred in England. The net charge to Great Britain, during 1849, in New Zealand, was about £173,000.

The expenditure defrayed from the commissariat chest by Great Britain, in 1849, in the colony, was:—New Ulster, £101,948; New Munster, 61,096=£163,044. This is exclusive of the Parliamentary grant of £11,589 12s. 3d, credited in the commissariat chest; it includes £2,424 for naval services. It appears that the New Zealand Fencibles cost, for 1849, £15,116; and for the erection of cottages in the same year, £12,185=£27,301.

The progress of military expenditure in New Zealand is thus seen, at two periods of three years each.

Year.	Expenditure.	Year.	Expenditure.
1841	£804	1847	£153,038
1842	1,426	1848	155,653
1843	8,093	1849	151,455
Total .	£10,323	Total . .	£460,146

Note.—These sums are exclusive of £28,992 furnished from the commissariat chest in aid of local revenue to the colonial government in 1847, and of £19,176 in 1848. They do not include the expenditure of the royal navy, which was very heavy; altogether the attempt of the New Zealand Company to dispossess the Maories of their land has in a mere pecuniary point of view cost the British exchequer at least a million sterling.

The sources of local taxation in New Zealand, in the years 1848-9, were:—

Duties on Imports.—On spirits, 5s. per gallon;

* The salary of the Governor is £2,500

cigars and snuff, 2s.; other manufactured tobacco, 1s.; on all other tobacco, 9d. per lb.; guns, weapons of every description, gunpowder, munitions of war, &c., £30 for every £100 of value; wine, £20, do; beer, £15, do. Goods, wares, and merchandise, not otherwise charged, the growth, produce, or manufacture of the United Kingdom, or of any British possession, £10, do.; goods, &c., from foreign states, £12:10s., do. The following articles admitted free of duty, live stock, bullion and coin, seeds, bulbs, and plants; printed books not being account books, common glass bottles imported full.* Similar duties are levied at Wellington and the other ports in New Zealand.

Among the other items of revenue are:—auctioneer's licences, £40 each, per annum; publican's do., general, £30; if within the limit of any borough, £40; night licences, additional, £10 per annum.† The "Raupo House Tax" is a levy of £20 per annum upon all owners of buildings constructed of raupo, nikau, straw, thatch, &c., within the boundaries of any town to which the provisions of the ordinance may be extended, if not removed within six months from the date of the proclamation. On all dogs found without a collar, 5s; with a collar and owner's name thereon, 2s. 6d. A slaughtering cattle licence, 2s. 6d.; and for each head of cattle slaughtered at a public slaughter house, 5s.; for every calf, sheep, and pig, 2s. 6d.

The depasturing licences are at the rate of £5 for a defined run; do. on crown lands, 10s. 6d. Assessment on cattle, each 8s.; on small do., 1s. each. For every licence to depasture cattle within the limits of a hundred, 10s. 6d. Licences to cut timber on crown lands, 5s. There are numerous public fees paid in the various offices.

The monetary state of New Zealand in 1849, is thus shewn:—

Districts.	Coin in circulation.	Paper currency in circulation.
Auckland	£50,000	£8,000
Russell	—	—
New Plymouth	700	400
Wellington	—	2,081

Note.—Where the — is inserted the amount is not known.

The paper currency is issued by a government bank, recently established, and by a branch of the *Union Bank of Australia*. The course of exchange is usually commissariat bills at par. Private bills from Auckland on England, 3 per cent. discount; from New Plymouth, 5 ditto; on Sydney, 1½ ditto.

The coins in circulation, and the weights and measures used are those of England.

There are savings' banks at Auckland and Wellington, for the encouragement of

* Blue Book of New Zealand for 1849, received at the Colonial Office, London, in March, 1851.

† Number of licensed public houses in 1848, at Wellington, 10; Nelson, 7; Otago, 3; Akaroa, 1.

provident habits, and of frugality among both European and Maori inhabitants.

Commerce.—The trade of New Zealand has disappointed the sanguine expectations entertained at the foundation of the colony. The export of flax has diminished for want of a cheap and expeditious mode of preparing it; the whale has well nigh deserted the coasts of these islands, in consequence of the exterminating practice of the shore whalers during the breeding season; the seal has altogether disappeared, and wool has not yet been raised in quantities sufficient to yield a large return.

Value of Exports of New Zealand produce.

Year.	Auckland.	Wellington.	Nelson.	Total.
1846	£40,187	£39,281	£2,672	£82,140
1847	12,670	19,128.	2,272	34,070
1848	15,096	19,550	1,772	36,416
1849	23,539	—	—	—
1850	—	—	—	—
1851	—	—	—	—

Note.—Wellington and Nelson, in 1849, no returns.

The staple items are, flax, wool, whale-oil and bone, timber, bark, kauri gum, ropes, hides; and from Auckland, in 1846, copper ore was exported to the extent of 1,202 tons, valued at £22,180. The wool exports from New Munster are increasing, and in 1851-'2, will probably exceed a quarter of a million pounds weight.

The value of the trade has been, for two years, thus:—

Districts.	1848.	1849.
Imports:—		
New Ulster	£124,434	£106,912
New Munster	109,410	147,767
Total	233,844	254,679
Exports:—		
New Ulster	21,329	54,668
New Munster	22,876	75,994
Total	44,215	133,662

The shipping outwards from ports in New Zealand, during 1849, was—

Ports.	Great Britain.		British Colonies.		United States.		Foreign States.		Total.	
	No.	Tons.	No.	Tons.	No.	Tons.	No.	Tons.	No.	Tons.
Auckland	2	908	48	10,162	21	3,393	9	2,138	80	29,622
Russell	—	—	1	465	4	698	13	3,827	18	4,990
Manganui	—	—	—	—	2	254	18	5,763	20	6,017
Hokianga	1	533	3	915	—	—	1	364	5	1,812
New Plymouth	—	—	2	202	—	—	—	—	2	202
Total	3	1,441	54	11,744	27	4,345	41	12,092	125	29,622
All the New Munster Ports .	2	1,055	50	9,688	2	648	17	5,760	71	17,151
Total of New Zealand .	5	2,496	104	21,432	29	4,993	58	17,852	196	46,773

Note.—The total number of men employed in this tonnage is, for New Ulster, 1,916; for New Munster, 924 = 2,841; or an average of one seaman to each eighteen tons of shipping.

The value of the principal articles of export from Auckland, produce of New Zealand, was, in 1844, £3,037; and in 1849, £23,539. The returns on this, and other matters, are defective.

The whaling establishments connected with the port of Wellington in 1843, comprised 4 ships, and 91 boats, giving employment to 768 men, and yielding produce to the value of £32,680. In 1848 there were only 2 vessels and 28 boats employed, and the produce was valued at £14,898.

Price of Labour.—Cheap labour was predicted as one of the most clear and satisfactory consequences of dear land in the Company's delusive programmes. The result has proved the fallacy of this as of its other propositions. During the years 1844-'46 and '48 the wages in Wellington District of domestic service ranged from £15 to £20 per annum, and of predial labour from £35 to £37; in both instances these figures did not include board and lodging; at

Wanganui domestic wages were £15 to £30. At Nelson predial labour ranged from £20 to £30; at Akaroa from £25 to £35.

Prices of Food, &c.—Wheat in Auckland District varied during 1849 from 3s. 9d. to 4s. 3d. per bushel; bread was 2d. per lb.; beef and mutton, 6d.; pork, 4d.; cheese, 1s.; butter, *fresh*, 2s. to 2s. 6d.; ditto, *salt*, 1s. 3d. to 1s. 6d.; tea, 1s. 6d. to 2s.; coffee, 1s.; sugar 4½d. to 5d.; tobacco, 1s. 10d. to 2s. 6d. duty paid; wine, 9s. to 10s., duty paid, per gall.; brandy, 15s. duty paid; beer, 7s.; horses, £18 to £20; horned cattle, £7 10s. to £10; sheep, 20s.; goats, 5s.; swine, 20s. each.

In Auckland District, in 1849, domestic labour averaged £30 per annum; agricultural, 4s.; and Trades, 7s. 6d. a-day.

At Wellington prices were nearly the same as at Auckland; some things were dearer; fowls and ducks 3s. to 5s. a-pair; geese, 5s. 6d. to 7s.; eggs, 1s. to 3s. a-dozen. The wages of domestic labour were, for males, £20 to £40; females, £15 to £25; agricultural, £35 to £60 a year; tradesmen, 6s. to 7s. a-day. At Nelson prices and wages were somewhat lower.

CHAPTER VI.

NATURAL PRODUCTIONS—VEGETATION—ANIMALS, BIRDS, REPTILES, AND INSECTS.

SEVERAL well-known scientific men have engaged in the examination and classification of the natural productions of New Zealand. Sir Joseph Banks and Dr. Solander; the two Forsters, father and son; Mr. Menzies, who accompanied Vancouver in 1791; Captain D'Urville, and his naturalist, M. Lesson, in 1822; and the brothers Cunningham, in 1826 and 1834, whose discoveries were subsequently published by Sir William Hooker. Dr. Dieffenbach, in 1840-'41, made diligent research, and has carefully recorded his own observations, together with those of his predecessors. Since his time, many intelligent travellers have visited these islands, but no professed naturalist; the following account is, therefore, chiefly derived from his interesting and valuable volumes, illustrated by remarks gathered from more recent writers.

VEGETATION.—New Zealand, with some of the adjacent islands (the Chatham, Auckland, and Macquarie's), forms a botanical centre. It is sufficiently distant from both America and Australia, to preserve its botanical peculiarities, and it offers a striking instance of the acknowledged fact, that the different regions of the globe are endowed with peculiar forms of animal and vegetable life.

The number of species at present known, is 632, of which number 314 are dicotyledonous or endogenous plants, and the rest, or 318, monocotyledonous and cellular plants. The consequence of this unusual proportion is very striking, and the traveller can scarcely fail to observe the scantiness of annual and flowering plants, of which, moreover, only a very few are possessed of vivid colours. In their place he will find a number of trees and ferns of various descriptions, which give at once a distinct character to the vegetation.

Among the CELLULAR, OR FLOWERLESS

* "On the dry hill lands between the mountains and the coast, which are not wooded, in some districts the prevailing growth is fern, in others grass. Where the former prevails, no crop can be obtained until the second year of cultivation, and both require manure to yield abundantly. In unwooded, low, alluvial lands, wherever the *Phormium tenax* or flax

plants, the tribe of the *algæ*, or sea-weeds, are numerous; upon some descriptions, pigs feed extensively. The large pods of several species of *laminariæ*, are used by the natives to contain oil and other fluids; some of them hold above a quart. There are many species of the *lichen* tribe; the volcanic nature, especially of the Northern Island, and the moisture of the climate being very favourable to their development. The fungi are also represented by several edible species. Champignons spring up wherever horses have been introduced. Another fungus, which grows to an enormous size, on the weather side of the tawaitree (*leiospermum racemosum*), is used by the natives as tinder. The tubar cibarium nearly resembles the European truffle; there are several varieties of it. In mosses and liver mosses, New Zealand is very rich; some are extremely beautiful; one species grows in the form of a diminutive fern tree; another is a cup moss, with brilliant scarlet sealing-wax-like tips and edges, and a third resembles bushes of white coral. Of all plants, however, the ferns, and fern-like plants are the most numerous, covering immense districts in the Northern, and large portions of the Middle Island; they replace the *gramineæ* of other countries.* Some of them grow to thirty feet and more in height, and the variety and elegance of their form, from the most minute species to the giants of their kind, are remarkable. The commonest description is the *pteris esculenta*, the root of which affords an article of food to the natives, that part being selected which is deepest in the earth; it is also eaten by cattle, sheep, and pigs. There are several tree-ferns, the loftiest of which, the *cyathea dealbata*, is forty feet in height. The undeveloped leaves of the *cyathea medullaris*, when cooked, are edible, as well as a portion

plant, the milk-thistle, the dock, or the bull-rush prevail, the cultivator can rely on a productive and immediate return on his labour. Where the flax plant grows in the low lands, they can be always drained, but where the bull-rush grows, much of the surface is too low to be drained." [From the diary of Mr. Tuckett.]

of the medulla; the flavour is rather insipid, but not disagreeable.

The number of *MONOCOTYLEDONOUS* or *EXOGENOUS* plants is very small in comparison with the cellular ones. Dieffenbach, who traversed the Northern Island extensively, declared that he had never met with (indigenous) grass in any other way than in simple specimens, excepting in the fertile district of Kaitaia; and on the barren volcanic table-land of the interior, where a coarse wiry grass, of a dirty yellowish colour, takes the place of the fern. Since then, however, extensive grassy tracts have been discovered, especially in the Middle Island, but the pasture, until manured, appears to grow generally in discoloured tufts.*

The useless, or almost useless *cyperaceæ*, or *sedge tribe*, are numerous, growing especially on the sandy downs on the seashore, or in swampy and stagnant places. The *toi-toi*, to which allusion has been so frequently made in the preceding pages, is a species of long rush-like sedge, used by the natives for forming the sides of their houses; it is fastened by bandages of flax to the wooden framework. The nearly related *restiaceæ* and *juncææ* have also several representatives, one of which, the *leptocarpus filiformis*, is a sure indication of shallow surface, and of a sub-soil, through which the water cannot percolate. The family of the *palmeæ* is represented by the *areca sapida*, a graceful tree, growing in the deepest recesses of the forest, and highly prized by the natives, who use its large pinnate leaves for roofing, while the tender shoot affords them food, and the heart is described by Angas, as resembling the cocoa-nut in flavour.

There are many species of the *asphodelææ*; the *dracæna australis* (ti or dragon-tree) forms jungle on the banks of the rivers; the *phormium tenax* (flax plant) is found everywhere, in swamps, on the driest hills, and on the sea side, where it is exposed to the spray of the salt water. One description has leaves twelve feet, and flower stalks twenty feet long; the flowers contain a sweet liquid in considerable quantities. The varieties of flax of the finest class must be planted; they require rich, moist, and flat, but not swampy land. All

* "The east and south coast of the Middle Island is for the most part unwooded, and grass is the prevailing vegetation; the "*phormium tenax*" prevails on strong rich land, and the bull-rush on tracts of very wet land. Where grass is found, on the lowest

the native clothing was formerly made of flax, prepared by scraping with the nail or with the sharp edge of a mussel-shell, and manufactured by entwining perpendicular threads with others extended horizontally, a simple but very tedious process. The *arthropodium cirrhatum*, the New Zealand lily, is one of its handsomest flowers; the large fleshy root is edible.

A climbing plant, belonging to the *smilacææ*, called *supplejack* by the Europeans, winds from tree to tree in the forests, often rendering the path scarcely passable. The natives use it to bind together the thatch-work of the houses, and the pigeon feeds especially on its red berries. There is one genus (three species) of the *iridææ*: the family of the *orchidææ* are more various, and have edible roots. Of the *aroideæ* the natives cultivate the *arum* or *caladium esculentum*, which they call taro, the tuberous root is the part eaten, and it forms a useful and nutritious article of food. The swamps of New Zealand are generally covered with the *typha angustifolia*, which under the name of *raupo* is a most useful material to the natives, who form the walls and roofs of their houses with bundles of it, tied together with a climbing fern, and eat the root, which is somewhat amylaceous.

Among the *climbing plants* which seek the support of larger trees, the principal one is the *freycinetia banksii*, the lower part of whose sweet and fleshy bractea, when fully ripe, resembles in flavour that of a rich and juicy pear, and is esteemed a great delicacy by the natives. The number of *PHÆNOGAMOUS* or *ENDOGENOUS* plants is stated by Dieffenbach at 314. There are two species of *piperaceæ*; one of these, the *piper excelsum*, is very common, and its leaves form a good and apparently healthy substitute for tea. The *conifereæ* and *taxidææ* comprise eleven or twelve species, and afford the most valuable descriptions of timber. The habitat of the majestic *dammara australis*, or *kauri*, is limited to the northern extremity of the North Island, and has a range of less than three degrees of latitude, and one degree of longitude; even in these narrow boundaries it is by no means a common tree, but is entirely confined to hilly situations. The smooth, grey, columnar stems, measure from thirty to plains and valleys, the land is generally very dry and sterile, and the grass, which grows in detached tufts, affords but very indifferent pasture. The grassy uplands adjacent to the coast afford better pasture." [Diary of Mr. Tuckett.]

forty feet in circumference, and maintain very nearly the same girth through a length of from sixty to even ninety feet. The crown of the tree, where it is irregularly branched, is small, and out of proportion to the trunk; and the foliage is likewise diminutive as compared with the branches. The wood is very light in proportion to its great strength and durability; it is therefore admirably adapted for spars and masts. The land on which it grows, even when cleared, is useless for occupation, from the rugged nature of the ground, and from the quality of the soil: it is one of the most remarkable phenomena in botany that such an immense tree should flourish where it could scarcely be supposed able to take root. The resin which it exudates is very hard, and forms large solid masses at the base of the tree. It is generally of a whitish colour, but through age, and, as it would seem, exposure to the sea-water, it assumes the golden yellow colour of amber, becomes transparent, and very closely resembles that substance. The kauri is the only coniferous pine in New Zealand; all the others bear berries, and ought to be classed amongst the very numerous family of the podocarpi or taxidæ, except the matai or mai, and the miro (dacyrdium matai, and podocarpus ferruginea), which must be separated into a peculiar genus, as the fleshy part of their seed-vessels do not surround the seed in the shape of a cup, as in the true taxidæ, but they bear drupes. The former* is a tree of moderate dimensions, affording a brittle close-grained wood, apparently capable of receiving a high polish; the latter grows from forty to sixty feet high, but does not attain a circumference of more than twelve feet; its wood is adapted for the spars of small vessels. The *phyllocladus trichomanoides* (tanekaha), or parsley-leaved pine, is a valuable tree, of straight tapering growth, sometimes attaining the height of sixty feet, but rarely exceeding three feet in diameter. Being less affected with wet than any other pine, it is much sought after for the decks of vessels, and all kinds of outside work; and its bark is used by the natives for dyeing a red colour. The *podocarpus totara*, with its dark green foliage, reddish bark, and gnarled trunk, is a noble tree; it varies in circumference

* "The mai (called black pine), the heaviest and best of the numerous varieties of the yew, the *kaihi-katea*, another yew tree (called white pine), and the *buccatea*, a species of laurel, are—particularly the first and last named—unfailing criterions of fertile

from six to eighteen feet, and frequently sends forth no branches within sixty feet of the ground, when they spring forth at an acute angle and form crowns at some distance from each other. It is much used for canoes, its durability being rather increased than diminished by lying in the water; it is besides comparatively easy to work. Where the totara is the predominant growth, the soil is mostly sandy or stony.

The *dacyrdium plumosum* (kawaka) is a graceful acacia-like tree, which rarely attains a large size: the *dacyrdium excelsum* (*kahikatea*) is a white pine, often exhibiting a clear stem of 80 feet, and with its branched head, attaining the height of 120 and 130 feet, and exceeding 5 feet in diameter. It is found in low, swampy ground, and has the quickest growth, and the least durability of its class. From its young shoots, which exude a bitter resinous juice, Captain Cook prepared a kind of spruce beer, which he found beneficial in the scorbutic disorders with which his seamen were affected. Its fruit is much prized by the natives, and the smallness of its size is compensated by its abundance. It also yields a resin, very bitter, but eatable. The fruit of the *dacyrdium cupressinum* (*rimu*) resembles that of the *kahikatea*. Its wood and resin partake the same qualities, but its appearance is more imposing, it being the most beautiful of the description of trees, incorrectly, but very generally called New Zealand pines, especially when young; its pendant foliage being then remarkably graceful. It comes to its greatest perfection in shaded woods, and in moist, rich soils. Its topmost branches are about eighty feet from the ground; the diameter of its trunk seldom exceeds four feet. Captain Vancouver, who found the rimu in abundance at Dusky Bay, cut down several of these trees to refit his vessel, and found the timber solid and close-grained, and very much resembling the Bermuda cedar. Passing the families of the *urticeæ*, *labiatæ*, *boraginæ* (gen. *anchusa* and *myosotis*), *convolvulaceæ*, *gentianæ*, *loganiæ*, *apocynæ*, *oleinæ*, *sapotæ*, and *myrsinæ*, we reach the *epacrideæ*, among which the *dracophyllum* is the most remarkable. According to Dieffenbach, some idea may be formed of it by imagining a pink that has become soil. These only grow in fat and compact alluvial land, and are not abundant, since true alluvial soil is of rare occurrence and very limited extent in New Zealand. The rimu and totara, on the contrary, when they predominate, indicate sterility." [Mr. Tuckett.]

so gigantic as to reach the size of a hazel-nut tree.

Of *ericeæ*, there is the genus *gaultheria* (3 species); the families of *campanulaceæ*, *styllideæ*, *goodenoviæ*, and *compositæ*, are represented: the two last by one genus; the first more extensively. Of *compositæ*, are the tribes *cichoraceæ*, *vernoniaceæ*, *asteroideæ*, and *senecionideæ*, which last has numerous genera. The sow-thistle springs up spontaneously in every spot which has been cultivated, and is much used as a vegetable by the natives. Of *rubiaceæ*, 8; of *conææ*, 1; and of *umbelliferaæ*, 5 genera are found. The *araliaceæ*, spread especially in South America, and are a remarkable family. In New Zealand four genera are found, of which the *aralia crassifolia* is the most striking: its long, narrow leaves spread out in a circle from the top of a very slender stem, and hang down in the shape of an umbrella.

Of *oxalideæ* there is 1 genus; *geraniaceæ*, *geranium*, 2 species; *pelargonium*, 1; of *hypericineæ*, 1; *meliaceæ*, 1; *sapindaceæ*, the *aledryon excelsum*, the berries of which are used for making oil; *bombaceæ*, 1; *tiliaceæ*, 1; *eleocarpeæ*, 2. The *eleocarpus linau* is a moderate-sized tree, whose wood is very white, but almost valueless, as it splits when exposed either to wet or warmth. It affords an excellent dye; either a light brown or puce colour, or a deep black. The fruit forms the favourite food of the large parrot, and the natives separate the farinaceous shell from the hard and oily kernel by friction in a wooden trough, and form it into cakes. Of the *sterculiaceæ*, *malvaceæ* (gen. *hibiscus*), *linææ*, *caryophyllææ*, *elatinææ*, *pittosporææ*, *droseraceæ*, *violariææ*, and *flacourtianææ*, there are one, or at the most, two genera. Of the *cruciferaæ* there are four, including the *nasturtium* and *cardamine*; of *ranunculaceæ*, the *ranunculus*, and the *clematis*, which adorns the forests with its starry flowers, and is wreathed by the Maori girls in the tresses of their soft, dark hair. The *corynocarpeæ* and *griselineæ* have each one genus.

Of the *saxifrageæ*, the chief genus is the *leiospermum*, of which, the species *racemosum* (tawhero) is a good sized tree, which forms extensive forests, and affords a strong wood adapted for the same purposes as mahogany. *Crassulaceæ*, 1 genus. Among the *ficoidææ* there exists one species of the genus *mesembryanthemum*, and the *tetragonia expansa*, or New Zealand spinach,

which, however, in the northern island, is very rare. *Passifloraceæ*, 1 genus; *cucurbitaceæ*, 1; *haloragææ*, 3; *onagrariceæ*, 2; the *epilobium*, and *fuschia*; of the latter there are two species, both very abundant.

The genera of the *myrtaceæ*, though not numerous, are, some of them, very widely distributed, while others form most beautiful and useful trees; the *leptospermum crecoides* (*kahikatea*), has sometimes a stem of one foot in diameter, and affords an extremely hard and durable wood; the *leptospermum scoparium* (*manuka*) supplies the place of the tea shrub; its blossoms exhale a fragrant perfume; it prevails over a vast surface of cold, poor land, retentive of moisture, having a stunted growth of from a foot to a yard in height; on warmer and drier land it has a more luxuriant growth, and resembles a thick coppice of naked poles, of extremely hard wood, attaining a height of thirty feet. The *metrosideros robusta* (*rata*) is called by Dieffenbach the king of New Zealand trees, being the hardiest and most lasting; the *m. pohutukaua* affords, perhaps, the most durable crooked timber that exists, and its crimson blossoms render it a very ornamental tree; the wood of the *m. buxifolia* is extremely hard and heavy, fit for cabinet work. There are several other species of *metrosideros*, one of which (*m. hypericifolia*) sometimes lines the cliffs, fixing its tendrils firmly to the rock, as the ivy does. The *myrtus bullata* (genus *eugeniæ*) is also common to Chilian forests. Of *rosaceæ*, is the *acoena sanguisorba*, a herb common to New Zealand and Van Diemen's Island, whose seeds attach themselves so firmly to the fleece of the sheep, that they can scarcely be separated in the washing.

The *leguminosæ* has 3 genera, peculiar to New Zealand. *Rhamnææ*, 5; *coriariææ*, 1; the *coriaria sarmentosa* (*tupakihi*), a very common shrub, bearing clusters of berries growing like bunches of grapes, from which a liquid (*tutu*) is extracted somewhat resembling elderberry wine; the seeds and leaves contain a very acrid poison, and often produce violent symptoms when eaten by cattle. *Rutaceæ*, 1. Of *euphorbiaceæ*, the *euphorbia glauca* grows amongst the shingle of the sea-shore, and on barren hills. *Santalaceæ*, 1; *thymelææ*, 1. Of the *proteaceæ*, the *tora* (*persoonia tora*) and *rewarewa* (*knightsia excelsa*), are the only known species. The latter yields a very beautiful wood, mottled with red upon a

ground of light brown; its dark purple flowers render it, while growing, a picturesque tree. It is the sole representative of the banksias, of which such a variety of species are known in New South Wales. Some species of the *laurineæ* are very common; the l. tarairi and calicaris form groves on the banks of rivers, especially in the vicinity of Waimate and Kaitaia; the l. tawa covers the upper regions of dry hills, especially on the Tararua Mountains, where it forms continuous forests, and bears a fruit somewhat resembling a wine sour plum, very sweet, with a slight flavour of turpentine. Of the *atherospermeæ*, the laurelia Nov. Zeland. forms a moderate sized tree. Of the *polygoneæ*, there are the genera, polygonum and rumex; a species of the latter, the crispus or common dock, has spread over extensive districts, through the disgraceful imposition practised by a knavish European, who sold the seeds to a native for those of the tobacco plant; *chenopodiææ*, 2; *amaranthaceæ*, 1; *peronychicæ*, 1; *plantagineææ*, plantago major, and varia; *primulaceææ*, the anagallis arvensis and samolus litoralis.

Of *scrophularineææ*, the genus veronica has as many as nine species. Some of them, peculiar to New Zealand, form shrubs, and bear very beautiful flowers. To the same

family also belong the gratiola sexdentata and euphrasia cuneata.

Of *cyrtandraceææ*, is the rhabdothamnus solandri. Of *solanæææ*, the berries of the *solanum laciniatum* are eaten by the natives, and its leaves used as cataplasms for ulcers. They also eat the leaves of another small species of the same genus. Of *myoporineææ*, the avicennia tomentosa is the mangrove of New Zealand, covering numerous shallow inlets. Of *verbenaceææ* (same order as the teak), the vitex littoralis is the "puriri" of the natives, and, from its hardness and durability, is the "oak" of the colonists. The wood splits freely, works well, and is not injured by exposure to damp; its only drawback for the timbers of ships or for the knees of boats, is the injury caused by the perforations of a large grub peculiar to the tree. The dark leaves, pink flowers, and cherry-like fruit of the puriri, have a pleasing appearance. It grows from fifteen to thirty feet without a branch, and varies from twelve to twenty feet in circumference.

The following tabular view of the timber trees of New Zealand, with their uses and relative stiffness, strength, and toughness, is given in the New Zealand Church Almanac for 1847:—

Name.	Uses.	Stiffness.	Strength.	Toughness.
1 Tawhero . .	All purposes to which Mahogany is applied	93	96	99
2 Matai . .	Cabinet Work and Musical Instruments	73	67	61
3 Koakoa . .	Furniture and Fancy Work, for which Cedar is used . .	81	72	60
4 Totara . .	All works exposed to water, or under the ground, and for pannel work of houses	49	61	57
5 Rata . .	All purposes to which Oak and Beach are applied . .	89	103	138
6 Puriri . .	Piles under water or ground; also ground plates, sleepers, posts, &c., where durability is required. Same qualities as English Oak	100	100	100
7 Akeake . .	Very hard and heavy, fit for cabinet work	—	—	—
8 Manuka . .	Turning, Carving, &c.	—	—	—
9 Mangiao . .	Agricultural Implements. Oars, and all the uses of Ash . .	89	119	160
10 Kauri . .	Scantling, plank, ship spars, &c.	90	99	102
11 Tanekaha . .	Spars of small vessels. Outside work	98	103	134
12 Miro . .	Uses similar to Tanekaha	—	—	—
13 Mapau . .	Chair-making and carpenters' tools	78	92	103
14 Rewarewa . .	Axe handles, and small cabinet-work	54	60	85
15 Pohutukaua . .	Timbers of ships, and all work in which curved timber is required	126	109	94
16 Wharangipiro . .	Cabinet-work, in which Satin wood is used	—	—	—
17 Rimu . .	All building purposes	90	81	95
18 Maire . .	Two varieties, white and dark; white good for sheaves, cogs, &c., the dark for cabinet work	—	—	—
19 Kowhai . .	Cabinet work instead of rosewood	—	—	—
20 Kohekohe . .	All uses to which cedar is applied	—	—	—
21 Rohutu . .	Chair and cabinet making	—	—	—
22 Kahikatea . .	Inside building work. Packing cases	54	68	85

Note.—Puriri, being equal to the English Oak in stiffness, strength, and toughness, has been made the standard of comparison

Many European fruits and vegetables have been introduced by the missionaries and settlers, and thrive well, varying, of course, with the climate, and more or less sheltered aspect of the localities in which they are planted. Apricot and peach trees have sprung up where the stones have been dropped by chance, and bear abundantly; melons and other fleshy fruits arrive at great perfection.

The grape grows well under the influence of the warm and equable climate of Nelson, and good wine will, probably, be eventually produced there. The Cape gooseberry flourishes almost like a weed, the hop plant has been introduced and cultivated, with considerable success, though, as yet, only on a small scale.

Of potatoes (supposed to have been first introduced by Captain Cook), several of the best kinds have been more recently brought both from England, and Van Diemen's Land, where they arrive at great perfection. Maize was introduced some time subsequent to Cook, but before New Zealand became a British colony; it is not known by whom. Tobacco is found to grow freely, especially in the northern part of the northern island. A variety of the coarser English grasses have been sown—but few of the finer sheep grasses have as yet reached New Zealand. Mr. W. Swainson, a Wellington settler who has expended much care and labour in their cultivation, writing in 1847, dwells strongly on the quantity of inferior seed which had been brought out by the colonists, and mentions as the grasses at that time most wanting, the *Phleum pratense* (Timothy grass) and *Cynosorus cristatus* (dog's-tooth grass).

FAUNA.—The flora of New Zealand is very limited in species, considering the extensive area and varied climate of these islands; and the fauna is yet more so. Captain Cook, in 1769, found no trace of any quadruped, except what he described as "a sort of fox-dog, and a few rats:" neither have more recent explorers. The only native tradition respecting the former existence of any animal, appears to indicate that a gigantic species of ape once dwelt in the wooded fastnesses of the Middle Island (see p. 314.) A small species of bat (*Vespertilio tuberculatus*) was figured by Forster, who accompanied Cook in his second voyage. The dog is not the same as the Australian dingo, but a much smaller variety, resembling the jackal, and of a dirty yellowish colour. It is now rarely

met with, as almost the whole race of the island has become a mongrel breed. A native dog is not a sufficiently powerful animal to do harm to domestic sheep; but it is different with the introduced and mongrel dogs, mostly bull-terriers, which are savage sheep or pig hunters, although with men they are great cowards. In the absence of better sport, they hunt young birds. The natives have a tradition, that their ancestors brought the dog with them when they first peopled New Zealand; but the Spanish word *perro*, occasionally applied to this animal, renders it probable that it was left here by some early Spanish navigator.

There are now two descriptions of rats, one called by the natives "kiore maori" (indigenous rat,) and the other—which is the English, not the Norway rat—"kiore pakeha" (strange rat.) On the former they fed largely in former times; but it has now become very scarce, owing to the exterminating warfare carried on against it by the European rat. The natives never eat the latter, as they declare the flesh to be most unpalatable.

The common domestic mouse has been introduced—it is not known in what manner; and also its sworn foe, the cat, which often runs wild, and soon assumes the streaky-grey colour of these animals in their natural state.

Pigs, introduced by Captain Cook, have thriven well, and multiplied prodigiously. Large numbers of wild hogs range the hills in perfect freedom, feeding upon the young fern root, and occasionally varying their diet by a banquet of fish. Emerging from the thickets at the ebb of tide, they crunch the oysters and immense cockles with which the sand-beaches are everywhere strewn, until the return of tide drives them again inland. They are generally black, and in flavour resemble mutton, rather than English pork. The natives hunt them, in their wild state, with dogs; but when keeping them as stock, rear them carefully: and the Maori females frequently pet young pigs, much in the same manner as European ladies fondle dogs and kittens, the "puorka" evincing, in return, considerable sagacity and attachment.

The horse, ass, sheep, ox, goat, and other European quadrupeds, have been introduced and acclimated without difficulty.

ICHTHYOLOGY.—The marine mammalia were formerly very abundant on the shores

of New Zealand; so much so, that the whale and seal fisheries were reckoned upon as affording a sure source of revenue, and the staple for immediate and profitable export. The ruthless slaughter of the breeding whale and her young, has materially injured this profitable traffic: the whales now migrate to more peaceful shores, and the seals have almost disappeared.

Among the *phocidæ* are, or have been found, the bottle-nose seal (*phoca leonina*;) the sea lion and lioness (*otaria jubata*;) and the sea bear (*arctocephalus ursinus*;) or fur seal of commerce, which is black, and from six to ten feet in length: it was formerly hunted in great numbers, especially on the western coast of the Middle Island, in Stewart's Island, and the Chatham Islands: now, only straggling individuals are met with.

Delphinidæ.—The dolphin (*delphinus* Zealandiæ,) and the grampus (*delphinus orca*;) is called by South Sea men the killer, from the destructive war it wages against the whale.* This description of fish are very numerous on the shores of New Zealand, especially in Cook Strait. Bishop Selwyn, in his *Journal* for 1848, records visiting a bay in Queen Charlotte's Sound, where "shoals of black fish and porpoises were enjoying their evening gambols, their dark bodies contrasting strangely with the red light reflected from the sun-set on the calm water, from which they sprang into the air, and fell back again, tracing all imaginable curves, with their awkward bodies, in their descent. It never happened to me to see so many fish out of water before. These monsters of the deep were not very pleasant neighbours; for their great amusement seemed to be to jump as near the boat as they could without touching it, and then make their bow, and dive under its bottom." (p. 69.)

Balenidæ.—The sperm whale (*physeter macrocephalus*;) is not uncommon in the latitudes of New Zealand, and often falls a prey to the ships which cruise in the open sea; but the cachelot does not approach shallow coasts and inlets, its habits being different from those of the black whale, from which it also differs in another important respect, its enormous lower jaw, in place of a comparatively harmless bone, being furnished with a set of teeth, which have often proved capable of crushing a boat into splinters. According to Polack,

* Polack, vol. ii., p. 407.

these whales frequently measure eighty feet in length, and contain, in the upper part of the head, as much as fifteen barrels, or 448 gallons of spermaceti. The substance called ambergris is found either in a single mass, or in many pieces, in the excremental glands of the sperm whale: the agreeable odour for which it is famed does not exist when it is first ejected; on the contrary, the smell is then of the most fœtid and offensive description. The outer skin of the whales differs much in colour, varying between white, black, ochreous, mottled, and dingy red. The humpback, or gibbosa, derives its name from the fat and cellular protuberance on its back; it is smaller, and yields less oil than the black, or right whale. The finback (*balæna physalis*;) has a greater length, and much less breadth than the preceding. It is distinguishable, at a great distance, by a fin projecting from the hinder part of the back, sometimes rising from three to six feet in height: its pursuit is peculiarly difficult and dangerous, as it is very swift and wary. The pike-headed *balæna* much resembles the finback; but it is smaller, seldom acquiring a greater length than forty feet, with a circumference of sixteen.†

The musculus, or large-lipped whale (*balænopterus musculus*;) has an immense upper lip, is common, and sometimes measures sixty feet in length. The black, or right whale (*balæna antipodum australis*, or *antartica*;) is the description generally captured. They are frequently found seventy feet in length, and belong (as do the finback and humpback) to the great division of the cetacea, known by the sieve-like, or screening apparatus (baleen) with which the mouth is provided, which furnishes the whalebone of commerce, and distinguishes them from the cachelot, or sperm whale. Another difference is, that the former have two spiracles, or breathing holes, in the centre of the forehead; the latter have also two within the head, but only one exterior aperture; consequently, when breathing, (which they can do only by raising their immense heads out of the water,) they "blow" through that single spiracle, ejecting the water, with a loud noise, to the height of many feet. Polack, writing in 1838, records another species, called the razor-back, from that part being remarkably serrated, with the mouth very pointed, like that of the porpoise.

The bays, creeks, and inlets of New

† Polack, vol. ii., p. 406.

Zealand abound with fish of various descriptions. Large shoals of several species visit the coasts at certain seasons, and are caught by the natives in immense seines, made of unprepared flax, in the same manner as those used in Europe; they are then dried in the sun. Some descriptions are captured with a canoe-shaped piece of wood, lined on one side with a thin plate of the pawa shell (*haliotus*), in imitation of a fish, with a hook formed of bone, a feather of the aptery being used for a fly. Flat fish and rays are transfixed with wooden spears in the shallow bays; fish of the genera *scomber*, *trigla*,* *serranus*, *sparus*, *balistes*, *labrus*, and *conger*, are caught either with the seine, or with hooks; a *myxene* with the hand, and four kinds of fresh-water eels† by baiting a skilfully constructed, funnel-shaped, basket of wicker-work. Large salt-water crawfish are caught by diving, in which art the women are very expert; fresh-water crawfish, which are common in the inland lakes and rivulets, are taken with bait.

A species of shark, which at Midsummer—that is, at Christmas—visits these shores in countless numbers, is held in high estimation; the flesh is dried and eaten, and the tooth worn as an ornament in the ears of both sexes.

The “hapuka,” the best and heaviest fish in New Zealand, is caught in pretty deep water, near reefs and rocks; it generally weighs from 10 to 70 lbs., but occasionally reaches above 100 lbs. It resembles the cod, but is of superior flavour; it is very nutritive, and the head and shoulders, when cooked, seem a mass of jelly. The “kawai” (*centropistes trutta*, or mulloides), resembles the salmon in its habits, entering in summer the bays, inlets, and fresh-water streams, in large shoals; in appearance it is like the mackerel, but is inferior in flavour. The “warcho” is something like the kawai, but better eating, being very palatable when cured and smoked.

* A singularly beautiful fish, frequently caught in Cook Strait, is nearly allied, if it be not identical with the species described by Cuvier, under the name of *trigla papilionacea*. It is of a bright orange-colour; its pectoral fins are large and membranous, and of an emerald green, bordered with white. Near the tail is a spot of velvet black dotted with white.—Dieffenbach, vol. i., p. 65.

† Mr. Brunner, during his exploration of the northern part of the Middle Island, found a particular tapu, or superstition, existing among the natives relative to the eel. He says, “You must wash your hands before going to catch them, and also on returning, and the bait must be prepared some

The “tamore,” or snapper; the “manga,” or barracouta, a fish about two or three feet in length, with a long sharp snout, and free from scales; the “mango,” or dog-fish, and various other descriptions, are caught by the natives, dried and stored in large quantities. The “moki” (*latris ciliaris*), is a good fish, something like the dorey. There are but few kinds of fresh-water fish; but eels of the finest description abound in the swamps, lagoons, rivers; and a small fish, very like the “white-bait” of the Thames, is plentiful in most of the rivers, and in the inland lakes. An excellent description of lamprey is caught in many streams during freshets. The conger eels are sometimes very large, measuring six feet in length, and as thick as a man’s arm.

Oysters (*ostrea cristata*), mussels of immense size, cockles, and other shell-fish abound.

ORNITHOLOGY.—The indigenous birds of New Zealand now in existence, are not remarkable either for variety of species, song, or plumage; neither are they of sufficient size or number to supply the deficiency so manifest, in the natural productions of these islands, of articles adapted for the sustenance of animal life. Several species appear to have become extinct; and the introduction of the dog, and more recently of the cat, have, doubtless, contributed to diminish their numbers, especially as some, such as the rails, possess very limited powers of flight, and one class, the apterix, cannot fly at all, being devoid of wings. The song-birds commence the melody described by Cook, (who heard them off the shore about a quarter of a mile distant,) as resembling “small bells, most exquisitely tuned,” about two hours after midnight, and cease at sunrise, being, like our nightingales, silent for the rest of the day; but they are not replaced by a host of warblers, like those whose joyous notes ring through the woods and dales of Britain.

distance from the house. There must be a distinct fire for cooking the eel, for which you must have a special tinder-box; your hands and mouth must be washed both before and after partaking of them; and should it be necessary to drink from the same stream from which the eels are caught, you must have two vessels of water, the one to drink from, the other to dip from the stream. Whether this relates to particular places or not I am not able to say; but I found it strictly adhered to at Okitika and Okaritu. At the former place I had to walk half a mile for water, with a stream running within a few yards of our station.” Other travellers also mention various superstitious observances on the part of the natives.

Some there are, however, of considerable interest and beauty, whose names and most striking peculiarities are noticed in the subjoined enumeration of the species at present known and described.

Falconidae—*falco harpe*, a large and powerful hawk, and *falco brunnea*, a sparrow hawk, exceedingly swift of wing, whose powerful talons few birds that it pursues can escape.

Strigidae—*athene Novæ Seelandiæ*, a small owl, called by the settlers, "more pork," from its habit of pertinaciously and distinctly reiterating this phrase for about half-an-hour before day-break. *Hirundinidae*—there are said to be several species of swallows in New Zealand.

Alcedinidae—*halcyon vagans*—a species of king-fisher, about the size of a jay, with rich and varied plumage.

Upupidae—the *neomorpha gouldii*—called "uia," by the natives, from its cry, is a very curious bird about the size of a magpie, with long, slender, and yellowish legs and feet. The plumage is of a glossy black, inclining to a green metallic lustre; its four tail feathers, long, broad, and tipped with white at the extremity, for about three-quarters of an inch, are highly valued as ornaments for the heads of chiefs on grand occasions. The white bill is slender, and semicircular in form; at its base are two wattles of a rich orange colour, a peculiarity which other New Zealand birds also possess. The flesh is delicate and palatable.

Meliphagidae.—This family includes the *prostemaderra* Nov. Zeland., the most amusing, and one of the most common birds found in these islands, called by the natives "tui," on account of its note, and by Europeans, the "mocking-bird," from its propensities, and the "parson-bird," from its appearance, two small clusters of long white feathers hanging down from the neck upon the breast, resembling clerical bands. It is about the size of a thrush, of a beautiful glistening black, with a few fine white hairy feathers about the head and breast. There is not a note of any bird of the woods, but what it exactly imitates; and when confined in a cage, it readily learns to repeat long sentences. It imitates dogs, cats, turkeys, geese, and, in fact, every sound within hearing, whether made by bird, biped, or quadruped. Power speaks of it as, even in its native, and, consequently, undomesticated state, "the jolliest and sauciest of the bird kind" he had ever met with, and

an excellent companion, chattering, whistling, and playing all sorts of antics. Its general food is flies and small insects, which it is very expert in catching, and the berries of various plants; but at certain seasons it may be seen extracting with its long slender tongue, the honey contained within the clustering crimson blossoms of the *pohutukana*, with the relish of an epicure. The *ptilotis cincta*, or "kotihe," (also a honey eater,) is a bird about the size of a goldfinch, has a slender dark beak, nearly an inch long; is as beautiful as the linnet in plumage, and more elegantly formed. The *anthornis melanura*, or "kokorimako," a small bird with dark brown plumage tinged with green, at long intervals enlivens the woods with its melodious notes.

Of the *certhiidae*, there are several species:—the *acanthisitta citrina*, *a. tenuirostris*, *a. punctata*, *a. longipes*, and *mohoua ochrocephala*, which last is a social bird of a yellowish colour, having much the habits of the finch.

Luscinidae.—The *sphenæacus punctatus*, or "matata," is a small dusky-coloured bird, with a short and heavy flight, which lives in swamps and among fern; the *acanthiza igata*; *certhiparus senilis*; *c. Nov. Zeland.*, and the *c. maculicaudus*, belong to the same family. *Turdidae*—*turnagra crassirostris*.

Musicapidae—*musicapa ventralabrum*, or fan-tailed fly-catcher, a bold, restless little bird, spreading its tail to the radius of full six inches, though its body is scarcely larger than a walnut; it is very useful in destroying the sand-flies and mosquitoes; *r. macrocephala*; *r. melanura*, a bird between six and seven inches long; *miro albifrons*, *m. longipes*; *m. forsterorum*, a bird about seven inches long, of deep shining black, with the breast and abdomen yellow; and *m. toi-toi*, a little bird no bigger than a tom-tit, which feeds on insects. *Corvidæ*—*callacas cinerea*, the New Zealand crow, resembles that of Europe; its plumage is of a very dark green. *Sturnidae*—*aplonis Zelandicus*; *a. obscuris*; *a. australis*, and the *crecadiion carunculatus*, which is very common, and about the size of a blackbird, called *tiera-waki* by the natives, from the sound of its loud and frequent cry. Its flesh is delicate.

Fringillidae.—The *alauda* Nov. Zeland., or ground-lark, is perhaps the most numerous species found in these islands; it is unfortunately no songster. Of the *psittacidae*, the *plater cercus*, Nov. Zeland., and the tri-

choglossus aurifrons, are two species of parquets, neither of them much larger than a canary-bird, with bright green plumage, and red or yellow about the head; who build their nests in holes of trees, associate in flocks, and are very mischievous to the corn-fields in fresh clearings; the nestor meridionalis, or "kaka," is larger; it appears closely allied to that isolated, and now, probably, exterminated species, the Port Phillip parrot, and has many peculiarities in its shape and habits. The bill is more elongated than that of other parrots; the plumage is varied and beautiful; the tongue small, terminating in several filaments. These parrots seem to have regular times of feeding; early in the morning they are found on the trees which yield their food; during the heat of the day they play about quietly in the topmost branches of high trees. Before the sun sets they assemble and fly with discordant screams over the forest. When it is dark they become silent; but rarely an hour of the night passes that one of their fluting calls is not heard, and with the dawn they are again in full activity. They nest in hollow trees, laying four or five white eggs. Their flesh is tender and well flavoured; and the natives are very expert in enticing them by means of decoy birds, or by imitating their cry. When one is caught or wounded, the rest hover about it with screams, and, one after another become the victims of their commiseration.*

Cuculidæ.—There are two species of cuckoo—*eudynamys taitensis*, and *chrysococcyx lucidus*; both these birds are migratory, appearing near the coasts in the month of December. The latter is known to lay its eggs in the nests of smaller birds, especially in that of the fantail fly-catcher.

Columbidæ.—A large wood-pigeon (*carpophaga*, Nov. Zeland.) with handsome and varied plumage, is very common; it is good eating, and being slow and heavy on the wing, is easily captured. Of the *tertraonidæ*, there is one very scarce species. To the *struthionidæ* belongs the rare and curious apteryx australis, or kiwi-kiwi, a nocturnal bird, which inhabits the deepest recesses of the forest, and generally lives in pairs, one pair occupying a certain district. At night-fall it leaves its hiding place in search of food, and strikes the ground with its strong, heavy foot, or turns it up with its long, slender beak, to put in motion the earth-worms, upon which it feeds. In ap-

pearance it is awkward and ungainly; one writer (Yate) describes it as about the size of a three-months'-old turkey, covered with coarse, long, and slender feathers, like those of the Australian emu; another (Power), says it is the ugliest bird one can well imagine; stilted up on long, thick clumsy legs, with scarcely the rudiments of wings, with an overgrown head and long beak; it goes sniffing about as if afflicted with a bad cold in the head; "when it scents out its prey, which it can do at several inches under-ground, it charges at it with an alacrity and vigour one would hardly expect from its clumsy, dead-alive look, and plunges bill, head, and neck into the earth, kicking and spurring with its legs, often half burying itself before it is successful." (p. 74.) It was formerly much used for food; the natives hunted it with dogs by torch-light, generally after a fierce struggle, in which the kiwi used its powerful legs with considerable effect. The gigantic *moa*, the fossilized bones of which have been alluded to (p. 321), must have belonged to this order.

Of the *charadriidæ* there are several species—*c. xanthocheilus*, a small bird with varied plumage; *c. obscurus*, a bird about the size of a thrush, of a spotted brown colour; and four or five other common, but not very interesting species.

Ardeidæ.—*Botaurus melanotus*, a bird somewhat resembling a crane, which dwells in swamps and marshes, and is very timid; and the *herodias matook*, or "matou cou" of the natives, a sort of bittern. Of the *scolopacidæ* (snipe), there is the *himantopus* Nov. Zeland., or "tutumata."

Of the *rallidæ* four species have been found: the *oryzodromus australis* contains the weka-weka, or wood-hen of the settlers, a bird with an exceedingly monotonous cry, which has become very scarce; the *rallus assimilis*, or "kataitai," is described by Yate as answering nearly to the godwit, feeding upon the sea-shore, and in sandy grounds; the *r. Dieffenbachi*, a bird about thirteen inches long, singularly streaked with many colours; and the beautiful *porphyrio melanotus*, the "pukeko" of the natives, a bird about the size of a pheasant, with plumage of a brilliant mazarine blue, a vermilion-coloured beak and top-knot. It is found in swamps; its legs are long, and its flight slow and heavy, like that of a bittern; the flesh is said to be hard and unpalatable.

Of the *anatidæ* there are several species;

* Dieffenbach, vol. i., p. 57.

the *casarca variegata* (paradise duck), is of large size, and affords good eating; the *anas superciliosa* is well flavoured, nearly resembling the wild-ducks of England; the *malacorynchus forsterorum*, or "wiho," which inhabits the mountain streams of the interior, is a black duck with a white bill, whose cry is a shrill whistle, and its flesh fat and palatable; the *spatula rhynchotis* and *fuligula* Nov. Zeland., are likewise found.

Of the *colymbidæ*, or divers—a tribe which may be regarded as intermediate between the duck tribe and the *alcidæ*, all of which are aquatic birds, admirably adapted by their structure for their mode of life—there is but one species, the *podiceps (poliocephelus) rufopectus*; of the *alcidæ* (*penquin*.) one or two.

Procellariidæ.—Of this order there are six genera, including several species of the *procellaria*, and a large and splendid variety of that marine vulture, the albatross (*diomedea exulans*.) Of the *procellaria*, the most numerous description is the mutton bird, or "titi" of the natives, a bird about twelve or thirteen inches long, much used by them as an article of food. They catch them during the winter months, and preserve them, after extracting the bones, by cooking them in a shallow platter made of the bark of the totara tree, then placing them in the water-proof and air-tight bags afforded them by the long pods, of a description of sea-weed, they pour over them their own fat. Mr. Brunner speaks of having tasted birds kept for two years in this manner, and found them very good; he adds, that they keep eels and seals in the same way, using whale-oil for their preservation. The habits of the bird are peculiar: the female lays but one egg, which, in proportion to her size, is very large; she builds no nest, but deposits and covers it over in a deep channel, under the roots of trees, or at the sides of a cliff, and never leaves the place until it is hatched.—(Diefenbach, vol. i., p. 148.) Of the *laridæ*, or gulls, there are four species: of the *pelicanidæ*, no less than eight. The most striking peculiarity of this family is the oar-like conformation of the foot, the hind toe being united to the rest by a continuous membrane, and the capability of the bird, notwithstanding, to perch on trees. Pelicans are numerous: they live, for the most part, on the ocean. The beautiful large-crested cormorants (*phalacrocorax*) are social

birds, and build their nests, many together, on high branches overlooking the rivers and coasts. The snow-white frigate-birds (*trachipeles aquilus*) are nearly allied to the cormorant, but differ from them in the excessive spread of wing, which renders them the most powerful flyers of this or perhaps any tribe: they dart upon their prey from a great height, causing a loud noise from the violence with which they strike the water, and feed especially on the flying-fish, seizing it themselves when near the surface, or from other birds, whom they compel to drop their prey. The gannets are very like the frigate-birds, but the wings are less extended, and the power of flight inferior: they also hover in the air, waiting for the timorous flying-fish, as it leaps up to escape the jaws of the dolphin, or some other funny enemy. The air-cells are very largely developed in the gannet, especially under the skin of the breast, which is almost completely separated by them from the muscles beneath; and they probably serve as an elastic cushion, to break the force with which the body of the bird would otherwise impinge on the water.

Turkeys, geese, ducks, and common fowl have been introduced into New Zealand, and became readily acclimated. Pea-fowl and guinea-fowl have also been taken from England, but it is not known with what success.

REPTILIA AND INSECTA.—Of either there are very few. No serpents or snakes of any description have been found; and the drawing of the latter, shown to Cook by a Maori, in 1775, was doubtless intended to represent a conger eel. A large guana appears formerly to have existed; but is now extinct. A small, harmless, and beautiful description of lizard is still frequently met with.

Among the *coleoptera* are several kinds of beetle. Among the *orthoptera*, two or three species of locust, which are not, however, found in great numbers, or very destructive; and one of the voracious mantis. Among the *neuroptera*, some beautiful kinds of dragon-fly, the largest of which (*petalura carovei*) measures from four to five inches in length; and two species of the short-lived ephemera, which, in their perfect state, take no food, and exist only a few hours. Ants (*hymenoptera*) exist, but in small numbers. Bees have been introduced most successfully. Among the homoptera are several species of the cicada, or grass-

hopper, some of which abound, and fill the woods and marshes with their chirping note. Two or three species, belonging to the *hemiptera* order, abound in the heated wooden huts of the natives. Among the *lepidoptera* are various destructive species of caterpillars, one of which is particularly pernicious to the potato plant. There are some moths and butterflies, but none very remarkable. The namu, or black sand-fly (*diptera*), is the most numerous and annoying of New Zealand insects: though smaller than a gnat, it has a painful sting. Another annoying insect is the common maggot, or blow-fly, which deposits its eggs on all provisions, and also on blankets, and any other woollen clothing left uncovered. Mosquitoes are found in the woods. According to the natives, they have been recently introduced; as also a peculiar tormentor of the human race, belonging to the aphaniptera, which they sometimes call "pakeha nohi-nohi," the little stranger. Of the class *arachnide*, small harmless centipedes are common, especially among dry wood of the sea shore. There are many species of spiders, one of which is called "katipo," and reported to possess the venomous qualities of the tarantula.

PRESENT STATE AND PROSPECTS.—New Zealand has scarcely completed the first decade of its existence as a British colony, and for the greater part of that period its European and aboriginal inhabitants have been in a state of actual or incipient hostility, induced chiefly by the proceedings of the powerful association, who, possessing ample funds, and great political as well as social influence, have squandered the immense sums confided to their care, in a system of colonization, alike unsatisfactory in its working to the government, the colonists, and the shareholders. If this were all, and the "old man of the mountain" were now fairly removed, it might be well, perhaps, to let their broken pledges, their selfish and pernicious policy, be forgotten; but when on the strength of a clause in a public enactment, obtained by a disgraceful series of manoeuvres, they claim to become extinct just in so far as is convenient, that is, in respect to their responsibilities, and with £100,000 of their own capital still uncalled for, to tax the land fund of New Zealand with a mortgage of £280,000, it behoves all interested in its welfare to take immediate

steps for the prevention of so cruel an injustice.

The territorial rights of the natives have been fully acknowledged, and consequently the first obstacle to the peaceful progress of the colony has been removed; their admission to a voice in the legislature, it is to be hoped will be considered in the constitution of 1852; but there still remains another stumbling-block, the excessive price of land. Without going into the contested question of what proportion of the area of these islands is adapted for cultivation, it is at least certain that very little of it can be worth sixty, forty, or even twenty shillings an acre; and that, granting its wastes and wilds to possess all the elements of fertility, very few immigrants can afford to purchase them at so exorbitant a price. The consequence must be to convert would-be agriculturists into graziers, and in unwisely endeavouring to compel concentration, to bring about its opposite, a squatting population. This is evidently the tendency at the present moment. Even in the Northern Island, where there are so few grassy pastures, it is observable, especially in the instance previously alluded to, of the Wairarapa Plains; in the Middle Island it is far more conspicuous, and, indeed, the latest and fullest descriptions of the country seem to indicate its being adapted in general, rather for pastoral than agricultural pursuits, and more especially for cattle and horses. It is yet to be proved whether the pasturage of New Zealand be not too rank, and the climate too humid for sheep, deficient in the very points (the high dry downs and short nutritious grasses) which have made Australia the sheep-farm of England. If, however, the sanguine expectations now entertained be realised, it is probable that the Europeans will form the pastoral interest, either by holding large tracts of land on leasehold tenure, or squatting wherever they can find food for their flocks; while the Maories will become, as in fact they are now already, the chief producers of grain and vegetables; and thus the two races mutually dependent on each other, may become closely allied. If this be happily the case, New Zealand, with its important position, extensive coast line, and numerous havens, must become a valuable colony, one that a Christian nation may rejoice in having been the instrument of establishing, and a lasting record of the benefits effected by missionary exertions.

BOOK IV.—ISLANDS OCCUPIED OR CLAIMED BY GREAT BRITAIN IN THE SOUTHERN OCEAN AND IN THE WESTERN PACIFIC.

CHAPTER I.

ANTARCTIC DISCOVERIES — VICTORIA LAND — THE FALKLAND, AUCKLAND, AND CHATHAM ISLANDS—POSITION, AREA, PHYSICAL FEATURES, PRODUCTS, &c.

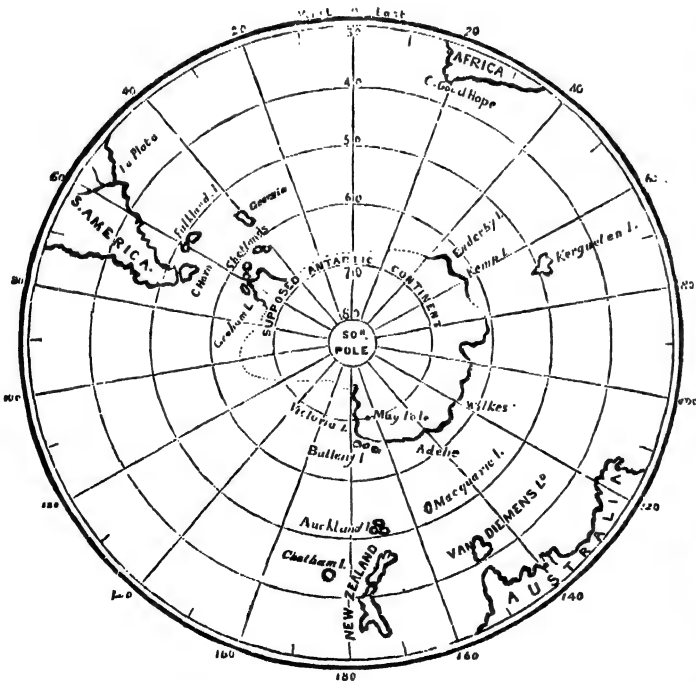

THE possessions of the crown of England, situated in the Great Southern Ocean, in and near the Antarctic Circle, are useful chiefly as fishing stations and positions, where whaling or sealing vessels may be refitted, and the crews refreshed, during the prosecution of their arduous and hazardous pursuits. Some, however, of the territories alluded to, consist of vast rocky regions, devoid of vegetation, and covered with snow, whose desolate, ice-bound shores, are visited only by the penguin and the seal, and the stillness of whose deep solitudes are unbroken save by furious tempests, and by eruptive towering volcanoes, which, ever and anon, send forth columns of vivid flame,

contrasting strangely with the dreary aspect of the surrounding frozen zone.

On looking at the annexed delineation, three great promontories will be observed stretching towards the South Pole—that of Africa, termed the Cape of Good Hope, was discovered in 1486; that of America, termed Cape Horn, in 1616;* and the now insulated portion of Austral-Asia, termed Van Diemen's Land, in 1642.

When Magellan sailed, in 1520, through the straits which bear his name, it was conjectured that a great south land stretched from thence around the Antarctic Circle; and some geographers surmised, that a chain of islands connected the southern ex-

trems of Africa and America. Subsequent explorations dispelled these ideas. In 1577, Drake, the first English seaman who circumnavigated the globe, passed from the Atlantic into the Pacific, by the Straits of Magellan. In 1616, Schouten and Le Maire, in two vessels, called the *Unity* and *Horn*, doubled the extreme south point of America, and proved the non-existence of the supposed *Terra-Austral*. A few years previous to this, however, another Dutchman (Gerard or Gerritz) was said to have been carried by a storm as far as 64° S. lat., where he sighted a mountainous country, looking like Norway, now known to be a group of islands—the South Shetlands.

* It has been supposed that Americus Vesputius, in 1502, penetrated as far south as the Falkland Islands, but there seems no sufficient ground for this opinion.

In 1592, John Davis (who sailed with Cavendish on his second voyage) discovered the Falkland Islands: their northern shores were coasted, two years afterwards, by Hawkins, who, unaware of their previous discovery, called the country *Hawkins' Maiden Land*. This name was superseded by Strong, an English navigator, who, in 1690, sailed through, and anchored in the Sound dividing the two main islands, to which he gave the name of *Falkland*, since applied to the whole archipelago. The islands called *Jason's*, or *Sebaldines*, at the north-western extremity of the group, obtained the latter designation from Sebald de Weert, who sighted them in 1600. They also received the general name of *Les Malouines*, in consequence of vessels from St. Malo visiting them between the years 1706 and 1714; and in compliment to one of the owners of these vessels, they were named *Anican Isles*. The Spaniards corrupted the word malouines into *mahinas*, and also into *ma-loon*, which term is sometimes used by English and Americans instead of island.*

On 23rd January, 1764, Commodore Byron (who had been sent from England by George III., on a mission to survey the Falklands, and to visit the South Seas) hoisted the union jack, fired a royal salute, and took possession of the islands in the name of his sovereign.

In 1769, and in subsequent years, Captain Cook proved the insularity of New Zealand, which Tasman had seen in 1642 (see p. 109); discovered an island, to which he gave the name of Georgia (see wood-cut;) traversed the Southern Pacific for 11,000 miles, without seeing land; made various important discoveries and surveys in the South Seas; and succeeded in advancing towards the South Pole, as far as $71^{\circ} 10' \text{ S. lat.}$, in the meridian of $106^{\circ} 54' \text{ W. long.}$, a position much beyond any that had been previously attained, when he was stopped by ice, which he supposed to extend around the Antarctic Circle.

In 1772, Kerquelen, a lieutenant in the French navy, under Captain Marion, who was killed at New Zealand (see p. 113,) discovered the island about midway between the Cape of Good Hope and Van Diemen's Island, which bears his name.

In 1791, Captain Vancouver, R.N., in H.M.S. *Discovery*, and the *Chatham*, Lieutenant Broughton, visited New Zealand. During this voyage Broughton discovered

a group of islands to the eastward of New Zealand, to which he gave the name of *Chatham*. In 1818, the *South Shetland Islands*, in $\text{lat. } 62^{\circ}$, were discovered by Captain Smyth, the commander of an English merchant vessel. In 1820, Captain Weddell discovered the *South Orkneys*; in 1823, the same enterprising seaman, in the course of a sealing expedition, with a brig of 160 tons, and a cutter of only 65, penetrated on the 20th of February to $74^{\circ} 15' \text{ S. lat.}$; 214 miles beyond the farthest point sighted by Cook. The sea was then open, and Weddell believed that the south pole might have been crossed or attained; but prudence, and the lateness of the season, compelled his return to the northward.

In January, 1832, Captain Biscoc, commanding a brig and cutter of Messrs. Enderby, engaged on a sealing voyage, discovered in $67^{\circ} 1' \text{ S. lat.}$, $71^{\circ} 48' \text{ W. long.}$, the westernmost of a chain of islands lying off the territory now known as *Graham's Land*. A group of five islands, one of them with a peak 12,000 feet above the sea, was discovered by a sealing commander named Balleny, in 1838. The lofty line of coast which is supposed to form part of the Antarctic continent, was visited by Admiral D'Urville, on the 21st of January, 1840, and called after his wife, *La Terre Adelie*. One week after, Commodore Wilkes, of the American navy, came in sight of the same territory, and entered a bay in $66^{\circ} 45' \text{ S. lat.}$ In January, 1841, Captain (now Sir James) Ross, in his perilous and nobly-conducted expedition, saw an extensive and remarkable region, in $71^{\circ} 15' \text{ S. lat.}$, consisting of two magnificent ranges of lofty mountains, whose summits, covered with perpetual snow, rose from seven to ten thousand feet above the sea. One peak, named Mount Erebus, in $77^{\circ} 32' \text{ S. lat.}$, $167^{\circ} \text{ E. long.}$, 12,400 feet above the sea, emitted smoke and flame in great profusion. The mainland had a southerly trending, with a range of lofty mountains in a south-south-east direction, in $78^{\circ} \text{ S. lat.}$; but the landing of the brave voyagers was prevented by lofty ice-cliffs stretching for 450 miles; soundings of 318 fathoms, of soft blue clay, were found within half-a-mile of the ice. The country was totally devoid of vegetation, and consisted of rocks, snow, and active volcanoes; it was taken possession of for, and named in honour of, Queen Victoria, and the flag of England planted on two of the larger adjacent islands.

* See *Voyages of H.M.S. Adventure and Beagle*, by Captain Robert Fitz-Roy; vol. ii., p. 232.

LUCIUS CAREY, VISCOUNT FALKLAND

OB. 1643

FROM THE ORIGINAL OF VAN DYKE, IN THE COLLECTION OF
THE RIGHT HON^{BLE} LORD ARUNDELL OF WARDOUR.

I have given this imperfect sketch of the progress of discovery in the Antarctic Ocean, because the whaling and sealing voyages prosecuted in these regions, led to frequent communications with them; indeed, so considerable has been the traffic, that from the South Shetlands group alone, in 1821-22, no

less than 940 tons of oil, and 320,000 seal-skins, were obtained; and in the course of a few years, more than a million seal-skins, and 20,000 tons of oil, have been brought into the London market from the islands and land near the south pole. Unfortunately the trade has of late materially diminished.

THE FALKLAND ISLANDS.

THIS singular archipelago, comprising nearly 200 islands and islets, covers an area of about 120 by 60 geographical miles, between the parallels of 51° and 53° S. lat., and the meridians of 58° and 61° W. long., and is distant about 7,000 miles from London. It lies 400 miles east of Patagonia, 800 north-east of Staten Island, 500 north-east of Cape Horn, and about 250 from the main land of South America, at the mouth of the Gallegos, and 1,000 from the Rio de la Plata. One hundred and seventy-two years after its discovery by Davis, Commodore Byron, as previously stated, took formal possession of the Falklands for the crown of England; and in the same year (1764), a M. de Bougainville proceeded thither with some Acadians and others, to found a settlement under the authority of the French government, but at his own expense. Spain then laid claim to the islands, declaring that they formed a part of her American possessions, and induced France to abandon the further prosecution of the scheme, on condition that the projector (Bougainville) and the colonists, should be indemnified for their losses; this was done, and on the 1st of April, 1767, the standard of Spain was hoisted, and royal salutes fired by the vessels present. Some of the settlers remained, others returned to Europe on board the Spanish ships.

Meanwhile the English government were commencing the establishment of a colony at Port Egmont, under a Captain Macbride, who, in consequence of Commodore Byron's favourable representations, was sent out in H.M.S. *Jason*, and reached the Falklands in January, 1766; but for three or four years, the English and the Spaniards were ignorant that they were both located on the same archipelago, and engaged in prosecuting similar objects.

As soon as the Spanish authorities in

America and in Europe became aware of the colonizing operations of England at the Falklands, the usual arrogant spirit was manifested; and although the sovereigns of Great Britain and Spain were then at peace, two Spanish frigates arrived at Port Egmont in February, 1770; and on the 4th and 7th of June, five other frigates, with 1,400 troops on board, with artillery, &c., reached the harbour where the British flag was flying.

The English received orders from the Spanish commander immediately to quit the place. Their force, consisting only of the *Favourite* sloop of sixteen guns, and the crew of the *Swift*, which had been wrecked, offered only a nominal resistance, and capitulated on the 10th of June to the superior armament; articles were signed by the respective commanders, under which the English were permitted to depart, taking with them such stores as they could carry, and receipts for the rest, for which the Spaniards became responsible. The information of these proceedings caused much excitement in England; preparations for war were instantly made; an address was moved and carried in the House of Lords for the restoration of the islands to the British Crown, and a long and able protest against leaving the sovereignty an open question, was drawn up and signed by Lord Chatham, the dukes of Richmond and Devonshire, and fifteen other peers.

The Spanish government became alarmed; its ministry, through Prince de Maserano, then ambassador in London, in a declaration, dated the 22nd of June, 1771,* disavowed the violence complained of, offered satisfaction for the same, and agreed to restore the islands. The troops of his most Catholic Majesty returned to Buenos Ayres, and the British again took possession; but the settlement, on the 20th

* Translated copies of the official correspondence between the English and Spanish government, are given in the *Statistics of the British Colonies* pub-

lished by Allen and Co. in 1839, for which I received the permission of her majesty's government. See appendix, *South America*, pp. 46, 47.

of March, 1774, was abandoned, not being then required. An inscription engraved on a piece of lead, and placed in a conspicuous position, notified the Falkland Islands, with the fort, storehouses, wharf, harbours, bays, and creeks, &c., to be "the sole right and property of his most sacred Majesty George III.," and the colours of Great Britain were accordingly left flying as a mark of possession.

For forty-six years nothing occurred worthy of note relative to these islands: they were visited by whaling ships, whose crews endeavoured to catch some of the wild cattle and horses, which had multiplied exceedingly, from a few head left there by the Spaniards. In 1820, Captain Weddell, when lying at Port Egmont, received notice from the captain of a South American Patriot National frigate, that "the supreme government of the provinces of South America had taken possession of these islands, in the name of the country to which they naturally appertain." In 1826, the Buenos Ayrean government granted, in perpetuity, to a German named Louis Vernet, the whole of the Eastern Island, and Staten Island, with their cattle and produce, on condition of his discharging certain arrears of pay which had accrued to some military officers in the Patriot service.

Vernet and his colleagues were to be exempted from taxation for twenty years, to possess an exclusive right to the fisheries throughout the whole archipelago, and on the coast of the adjacent continent, to the southward of the Rio Negro, on condition of a colony being established within three years. He induced others to co-operate with him, employed capital, carried on a trade in hides, oil, and salt fish, and proceeded vigorously to convert waste and dreary solitudes, into a useful and peopled settlement, which, he rightly foresaw, vessels of all nations would visit on their outward and homeward voyages round the "Horn." Desirous of enforcing his supposed rights, Vernet sought aid from the Argentine republic at Buenos Ayres: that government was unable to furnish him with a ship of war; but they nominally invested him with authority, as governor of the Malvinas (Falkland Isles) and Terra del Fuego, to neither of which, however, they had themselves even an ostensible title.

* For fuller accounts of these events, *vide Statistics of the British Colonies*; 1839: p. 45.

† Captain R. Fitz-Roy, R.N., who surveyed the

In 1829, Mr. Parish, the representative of the sovereign of England at Buenos Ayres, delivered a protest against this unwarranted occupation of the Falklands; and two years after, the British commander-in-chief on the South American station was directed to send a vessel of war, to cause any military force belonging to the Buenos Ayrean government to be conveyed from the islands. Before this, however, while the British government were still unaware of the occupation of the territory in question, M. Vernet, in virtue of his supposed authority as governor, had warned American sealing vessels not to pursue their avocations at the Falklands; and, in 1831, he seized some, and sent them to Monte Video to be confiscated.* Thereupon Captain Silas Duncan, of the United States corvette *Lexington*, then in the River Plate, proceeded on his own responsibility to the Falklands, attacked the settlement, made several of the inhabitants prisoners, destroyed much property, and carried Mr. Brisbane, the agent of M. Vernet, and others, prisoners, to Monte Video, in February, 1832. The cabinet at Washington approved Captain Duncan's proceedings, and sent a *chargé d'affaires* to demand compensation and full reparation for the injury done to their vessels. An angry correspondence ensued between the two republics, which was terminated by the British re-occupation of the islands, on the 2nd of January, 1833, when the standard of England was hoisted, and the small Buenos Ayrean garrison quietly withdrew. The rights of England being acknowledged, H.M.S. *Clio* and *Tyne* then left the Falklands, and the colours (to be hoisted on Sundays) were entrusted to the charge of an Irishman who had been M. Vernet's storekeeper. In 1834, a lieutenant in the royal navy, with a cutter and her crew, from one of our ships of war on the South American squadron, were stationed at Port Louis, and in 1842 a lieutenant-governor and a small establishment was appointed by her Majesty's government to form a colony, whose present condition will be shown in the following pages.†

AREA AND PHYSICAL ASPECT.—Although this southern archipelago consists of between two and three hundred islands, there are but two of considerable size, viz., *East*

Falklands, has recorded, in vol. ii. of his valuable work, many interesting facts respecting the history and natural productions of these islands.

Falkland, about eighty-five miles long, by forty broad, with an area of about 3,000 square miles, or nearly 2,000,000 acres, and *West Falkland*, about eighty miles long, by twenty-five to thirty broad, (exclusive of three extended arms,) with an area of about 2,000 square miles = about 1,300,000 acres. *Weddell Island*, to the westward of West Falkland, is about twelve miles long, by twelve broad. The rest of the group are small, and generally lie pretty close around the main territory, except the *Jason Isles*, which are to the north-west, and an islet, named *Beauchêne*, to the southward.

Probably no other region of a similar extent contains so many fine harbours. East and West Falkland are separated by Falkland Sound, which is about seventy miles in length, by five to fifteen in breadth. On both sides, especially on the eastern, are numerous harbours. It would be tedious to enumerate them: a few, however, of the more prominent may be mentioned.

Berkeley Sound, at the north-east extremity of East Falkland, is about twelve miles in length: at its head, on a rising ground, and in an exposed situation, Bougainville formed the settlement of Port Louis. The British officer in charge was some time located here, and the position was named Anson: the chief authority is now established at Port Stanley. *Port Salvador*, on the north, is a very extensive inlet, and there is a large cattle-taming station there. *Port San Carlos*, on the north-west coast, is a good haven, with two large locks running deep into the land. The Bay of Harbours, as its name denotes, contains several safe havens.

West Falkland is very much broken, especially along its western coast. *Keppel* and *Pebble Sounds*, on the north, with *Port Purvis* and *Port Eymont*, are capacious havens; but the latter is very difficult of approach. *Byron Sound* and *King George's Bay* are to the north and south of a long and elevated promontory, near the centre of the western coast. *Queen Charlotte's Bay*, with *Philomel Road* on the north, and *Port Richards* on the south, are good and extensive anchorages. On the southern coast there are *South Harbour*, *Ports Stephens*, *Albemarle*, and *Edgar*.

Weddell Island has *Chatham* on its northern, and *Quaker Harbour* on its western shore. *Beaver* and *New Island* have also secure anchorages. *Ship Harbour*, in the latter, is the best in West Falkland: good peat, for fuel, is very abundant there; and

on *Ship Island*, close at hand, it is inexhaustible. Plenty of good water is procurable close to the anchorage, which is in seven fathom water, on a stiff clay bottom.

The appearance of the Falklands from seaward is singular. Instead of a low, level, barren country, like Patagonia, or a high, woody region, like *Tierra del Fuego*, there are ridges of rocky hills, 2,000 feet high, traversing extensive moor tracts, devoid of trees, or sloping towards low and broken ground, with rocky, surf-beat shores. Around the archipelago, especially towards the south-east and north-west extremes, there are numerous islets and rocks, which, with strong tides and violent winds, make navigation dangerous. The view from the heights is very dismal: moor land and black bog extend as far as the eye can discern, intersected by innumerable streams, and dotted over with ponds of clear water, varying in size from half-a-mile to a few hundred feet across.* Much, however, of what seems barren moor is solid clay, covered with a thin layer of vegetable mould, on which grow shrubby bushes, and a variety of grasses.

East Falkland Island is nearly divided into two equal parts—*Choiseul Sound*, on the east side, being separated from *Brenton Sound* on the western by an isthmus, not more than a mile-and-a-half wide. Across the northern portion of East Island there is a range of very rugged-topped mountains, termed the *Wickham Heights*, whose elevation is from 800 to 2,000 feet above the sea. They form a chain from east to west; and as the quartz rock crops out nearly vertical, and with great irregularity, there are only a few passes where cattle can cross the range. On the south side of the mountains there is a continued undulating plain, whose greatest height is not sixty feet above the sea level, the undulations being from north-west to south-east, towards Berkeley Sound. The valleys or vales are numerous, each communicating with one or other of the shore-creeks or inlets. There are also several lakes and lakelets. There are but few rivers in these islands: the *San Carlos*, in the East Falkland, is the largest known; it is very winding, and only about thirty miles in length; navigable for boats a distance of about eight miles, for which distance the width averages 100 yards.

* *Voyages of the Adventure and Beagle*, by Captain Fitz-Roy, R.N.; vol. ii., pp. 227—240, &c.

On the north portion of the Western Island there are several elevated but isolated ranges: the *Hornby Hills*, running parallel to Falkland Sound, in about $51^{\circ} 30'$ S. lat., have a height of from 1,700 to 2,270 feet. *Mount Maria*, near *Port Howard*, is 2,185 feet above the sea. *Mount Edgeworth*, nearly midway between *Port Howard* and *Byron Sound*, is 1,920 feet. *Mount Adam*, distant ten miles to the south-west, is 2,315 feet. The *Byron Heights*, stretching to the westward along the peninsula, vary from 1,000 to 1,700 feet in altitude. There is supposed to be a fine and well-watered valley between the Hornby and Byron Heights. Large ponds are said to exist; but very little has been ascertained respecting the interior of the country.

The *Chartres River* appears formed by the junction of two streams flowing from *Mount Moody* (1,845 feet high) near the east coast; it then flows nearly west for about ten miles, and falls into a narrow arm of the sea, termed *Christmas Harbour*, which is nearly fifteen miles in length. This would seem to be one of the most eligible spots for the formation of a settlement.

Stanley, the capital of the colony, is situated in East Falkland, at the east end of the Wickham Heights, at the head of a fine harbour termed *Port William*, of which *Stanley Haven* is a land-locked inlet.

Mount William rises to a height of 800 feet close to the town, which is as yet quite in its infancy. The whole northern part of the island is called *Stanley County*; the southern portion *Lafonia County*. This latter division is said to contain twenty-four good harbours, besides innumerable creeks and coves. There are also about forty large promontories, capable of being isolated for the breeding of cattle, &c.

GEOLOGY.—Dr. Darwin, who accompanied Captain Fitz-Roy, examined, as far as his time permitted, the structure of these islands, which, he says, is in most respects simple, the lower country consisting of clay-slate and sandstone, associated together; and the hills of white granular quartz rock, with strata frequently arched with perfect symmetry, and presenting the appearance of the seats of an amphitheatre in ruins. The quartz must have been in a pasty state when it underwent such remarkable flexure without being shattered into fragments. As a passage between the quartz and the sandstone can be traced, it seems probable that the former owes its origin to the land-

stone having been heated to such an excess, that it became viscid, and upon cooling crystallized; while in the soft state it must have been pushed up through the overlying beds.

The celebrated "*streams of stones*" are found on the north side of the dividing ridge of the eastern island; possibly similar phenomena may hereafter be discovered in other parts of the archipelago: they consist of myriads of cubical fragments of quartz rock, of varying sizes, their angles generally but little broken; some are so large that a man may find shelter beneath one of them. In several places they are spread out in the valleys as if in a flowing current of a quarter to half-a-mile wide; in others they lie in a sloping direction on the hill sides, at an angle of ten degrees with the horizon, and have a breadth of thirty feet to a quarter of a mile. Beneath these stony beds the flow of water may be heard many feet below the surface. The peaty soil is narrowing at the borders, and even forming islets of the stones wherever a few fragments happen to lie close together. On the crests of the neighbouring low rounded hills, whence these singular "*streams*" seem to have descended, huge masses of quartz, exceeding a small building in dimensions, are found, as if arrested in their course, and the curved strata are piled over each other like the ruins of a vast cathedral.

Dr. Darwin declares, that although he had seen, in the Cordillera of the Andes, the evident marks where stupendous mountains had been broken into pieces like so much thin crust, and the strata thrown on their vertical edges, no scene had ever impressed upon him, like these "*streams of stones*," the idea of a convulsion, without a counterpart in historical records. On the highest peak of a range (700 feet above the sea,) in the eastern Falkland Island, lies a great arched fragment of quartz, many tons in weight, on its convex or upper surface, as if fairly pitched into the air, and then turned over. He infers that the period of violence was subsequent to the land having been raised above the ocean level. It seems probable that the cubes of quartz have been hurled into the valleys down the nearest slopes, or that masses of rock were broken up in their original position, and that by a vibratory movement of overwhelming force, the fragments have been levelled into continuous sheets. The best idea which can be given of this sin-

gular natural feature, is by imagining that streams of *white* lava had flowed from many parts of the mountains into the lower country, and been there, when consolidated, rent by some terrible convulsion into innumerable fragments.*

The Falkland fossils, like those of England, are associated with remains that indicate a climate of tropical character. Those found in the sandstone and clay-slate, consist chiefly of shells allied to terebratula, of encrinurites, of a branching coral divided into alternate compartments, and of an obscure impression of the lobes of a trilobite.

Most of the mountain summits are much shattered, extremely rugged, and, consequently, difficult to climb. At Mount Skyring the stones, when struck together, give out a sulphurous smell, and are strongly magnetic. Some such causes may produce the faint glimmering lights which are seen at long intervals on the hill-tops, appearing like the flash of a pistol at a great distance.

The *mineralogy* is, as yet, unexplored; there are said to be marks of copper ore with pyrites; and the geological structure is strongly indicative of the presence of metals. Coal has been discovered, but no attempt has hitherto been made to employ it. Ochres of different colours are common.

An analysis of the Falkland Islands coal compared with that from Dean Forest, in England, was made by Sir H. T. de la Bêche, for the Admiralty: the distinguished geologist supposes the specimens to have come from Sussex Harbour, East Falkland, and says they "show good bituminous coal fit for a variety of purposes. The following is the comparative analysis, with the appended remarks of the analyser:—

Analysis.	Falkland Islands.	Dean Forest.
Carbon	77.97	71.14
Hydrogen	5.42	4.90
Nitrogen	0.95	1.41
Silica	2.00	0.85
Alumina	1.84	0.65
Sulphate of lime	0.24	—
Iron pyrites	—	7.12
Seaqui-sulphate of iron	—	1.60
Water	3.25	4.68
Oxygen and loss	8.33	7.67

* Although the specimens thus prove the occurrence of good coal in the Falkland Islands, it should be observed that further information is necessary in

* Dr. Darwin, vol. iii., pp. 254, '5, '6.

order to judge of the capability of its being profitably worked; information showing the thickness of the coal beds, and the dip or angle they make with the horizon, coal frequently occurring in beds too thin to be of any economic value.

"Beds of coal three or four feet in thickness, have been stated to have been found in the Falkland Islands; but this requires confirmation.

"Among the remaining specimens, which are chiefly those of ordinary rocks, are some of the peat said to abundantly occur in these islands. These specimens show that, as in some of the great peat bogs in Ireland, the lower parts of the peat accumulations assume a very bituminous character. From White Rock Harbour, West Falkland, there is a specimen so highly bituminous, that it has nearly the aspect of pitch; it burns with a brilliant flame, and might be very advantageously employed for gas light purposes; it would also, if properly treated, afford coal-tar, and would also be valuable on this account, if it should be found to occur in sufficient abundance."

SOIL.—Accounts are varied, and so little is really known, that they must be received with caution. Some writers say that there is mostly from six to eight inches of black vegetable mould, on a stratum of strong clay: others consider that the surface is chiefly a bog earth, and that, owing to the nature of the soil and climate, cereal crops cannot well be raised. It is very probable that oats and barley would thrive, and judging from the fatness of the wild cattle and horses, pasturage must be abundant and excellent. Wherever potatoes and garden produce have been cultivated, the soil has yielded a great increase.

The bogs are composed of a very compact black peat, highly bituminous, which, when dry, burns with great intensity; they may be traversed everywhere by a man without difficulty, and in most places by a horse. Even the worst are covered with a coarse, wiry grass, and nowhere did the late governor (Mr. Moody) find them uncovered, as in Ireland, or in Scotland. Wherever horses and cattle frequent, the brown moorish look of the surface gives place to a greener and more luxuriant appearance, and where the ground has been fired, a tender sweet grass springs up, mixed with a white clover.

CLIMATE.—Although in latitude in the southern hemisphere corresponding to that of London, and the Midland Counties in the northern, viz., 51° to 53°, the temperature is more equable than that of England; the mercury rarely falls below 26° Fah. in the coldest winter, or rises above 75° in the hottest summer; the general range is from 30° to 50° in winter, and 50° to 75° in summer.

Snow seldom lies on the ground more than half-an-inch thick; heavy long-continued rain never occurs; showers are frequent; thunder and lightning of rare occurrence; fogs are seen in autumn and spring, but they usually dissipate by noon; the winter is about a month longer than the summer. The long warm days of the vernal solstice, with occasional showers, produce a rapid vegetation. Upon the authority of a naval officer, who has been many years resident on the islands, there are two hours' sunshine at the Falklands for one in England throughout the year.*

The winds blow chiefly from the north-west in summer, and south-west in winter, but seldom long from the eastward in either season. A north wind almost always brings rain, especially in summer, and east and south-east airs are constantly accompanied by mist and rain. The finest weather in winter is when the breeze draws from the west or north-west, and in summer, when it stands at north-west or north-east. Snow-squalls generally come from the south-south-west or south-south-east. The winds are rarely at rest during any part of the year; storms are most frequent at changes of the seasons, and come usually from south-south-west to west-south-west, but they seldom last more than twenty-four hours. During summer, a sea-breeze, similar to that which occurs in the tropical regions, sets in from the westward, often increasing to a gale during the day, and dying away gradually towards night-fall. During the summer a calm of four-and-twenty hours' continuance is an extraordinary event, as it generally blows hard from 9 A.M. to 4 P.M.; the evenings and nights are, however, usually mild and still.

Unquestionably the place is exceedingly salubrious; no peculiar disease has been contracted by those who have resided there several years, and persons afflicted with pulmonary complaints are stated to have experienced a great mitigation of their sufferings.

The climate of the Western is milder than that of the Eastern Island.

VEGETABLE PRODUCTIONS.—In East Falkland, which alone has been to any extent explored, no trees are found, and the largest bush (belonging to the family of the *compositæ*) is scarcely so high as the English

gorze. Wood for building is, however, obtainable from the adjoining Straits of Magellan. For fuel, besides peat and turf, which are abundant in many places, and may be procured dry out of the penguins' holes, three kinds of bushes are found, called *fachinal*, *matajo*, and *gruillera*. The first of these grows straight, from two to five feet high, and the stem, in proportion to the height, is from half-an-inch to one inch and-a-half in diameter; small woods of this are found in all the valleys, and form good cover; it bears no fruit. The second is more abundant in the southern than in the northern part of the island; its trunk is nearly the thickness of a man's arm, very crooked, never higher than three feet, and bears no fruit. The *gruillera*, the smallest of the three, is about the size of the common heath, it grows close to the ground, and is abundant all over the island; being easily ignited, and having the valuable property of burning while fresh and green, it is chiefly used as fuel by the people when away from the settlement, and to light the peat fires in the houses. It bears a small dark red berry, of the size of a large pea, and of an insipid taste.

A small low plant (*myrtus nummuralia*), produces a berry of the size of a large pea, of a whitish rose colour, and a fine flavour: a decoction of the leaves is commonly used as a substitute for tea.

Wild celery (*apium graveolans*) and the little cress (*cardamine glacialis*) are wholesome and agreeable. The so-called scurvy grass a description of sorrel, which loses its leaves in winter, is an excellent anti-scorbutic; its leaves, when boiled, make a sort of "gooseberry fool;" and it may also be used instead of lemons for sour sauces and lemonade. A native spinach (a species of *atriplex*) is a good pot-herb.

The most curious of the vegetable productions (the *hydrocelia gummifera*) is a plant, or rather excrescence (for it grows from the earth without stalk, branch, or leaves,) called the resinous gum plant. It is frequently six feet in diameter, and eighteen inches high, and so strong as to bear the weight of a man. Its surface ejects drops of a tough resinous matter of a yellow colour, and about the size of peas, having a strong odour like turpentine, which is called balsam by the settlers, and used as such. Among the lichens are some which yield fine colours with pure ammonia.

The *tussac* is a gigantic sedgy grass of

* Captain Sullivan, who has been engaged in completing the survey of the Falklands, commenced by Captain Fitz-Roy.

the genus *carex*: the blades run seven feet long, and about an inch wide, as many as 250 stems springing from a single "stool." It is sweet and tender, forming, perhaps, a more nourishing food for horned cattle than any found growing spontaneously in other parts of the globe. The sea shore, and all the small islets, are fringed with this grass, and its highly nutritious roots have been found available, in cases of need, for human food. Governor Moody in a despatch dated January 17th, 1844, urgently advocated the introduction of this grass into Britain, especially into the Orkney and Shetland Islands, as the experiments he had tried showed that it would grow on almost any soil, and that, although the place of its natural growth was from 300 to 400 yards from the shore, yet it would thrive without being exposed to the sea spray. He adds, the tussac grass rises high above the snow, is fresh and green all the winter, and from its height completely shelters the horses and cattle lying among it.

There are several other valuable grasses: the most abundant (*arundo alopecurus*) covers every peat-bog with a dense and rich clothing of green in summer, and a good pale-yellow hay in the winter season; no bog, however rank, seems too bad for this grass to luxuriate on; and its naturally dried hay is greedily devoured by the troops of wild horses which range along the flanks of Wickham heights. It is not yet satisfactorily proved whether sheep will thrive on this vegetable, whether in the shape of grass or hay. The cattle have so wide a range, that the long grass is never thoroughly fed down, but grows in tufts, fresh shoots continually springing from the same shoot, leaving the old and withered stalks standing.

How far the fruit, grain, and vegetables of Europe will succeed at the Falklands is still to be ascertained. Captain Fitz-Roy is of opinion, that fruit which requires much sun certainly will not ripen. Wheat, tried in M. Vernet's small, manured, and high turf-fenced garden, produced a full ear and large grain: potatoes, though put into holes, and left to take their chance, yielded three pounds weight from one root: they were large, but necessarily watery, from not having been planted in drills or ridges, nor trenched. Turnips are well flavoured, and of large size: Captain Fitz-Roy saw one that weighed *eight-and-a-half pounds*. Carrots, cabbage, and lettuce may be brought to

great perfection, particularly on sheltered banks sloping towards the north-east. Flax succeeds well. Hemp has not been tried. Currant-bushes, brought from Tierra del Fuego, did not, at first, yield properly-ripened fruit; but it must be remembered, that in the country whence the bushes were obtained, they grew wild, and the produce even there was scarcely eatable. Bougainville and Wallis say, that thousands of young trees were taken up by the roots in the Straits of Magellan, and carried to the Falklands, where they were planted; but no trace of them is now visible. By planting thickly, and sheltering the young shrubs from the fury of south-west storms, by lofty mounds of turf, hardy trees might undoubtedly be raised.

ZOOLOGY.—No quadrupeds were found on these islands at the time of their discovery, except a kind of wolf-like fox, peculiar to them, which kennels under ground. In size, the larger ones are about twice as bulky as an English fox, and they stand nearly twice as high upon their legs: their heads are coarser, and their fangs longer and sharper; their fur is thicker, and of a woolly nature; they are very rapacious, and feed upon birds, rabbits, mice, eggs, seals, &c.; and to their habits of attacking king-penguins, if not seal, while alive, may probably be traced the unhesitating boldness with which they approach man. When Byron visited the Falklands, in 1764, four of them "ran up to their bellies in the water to attack the boat," upon which the sailors jumped out of it to avoid them, mistaking their curiosity for fierceness; and the officers of the *Beagle*, while employed in surveying these coasts, "were often annoyed, as well as amused, by the intrusion of these fearless animals." There are no reptiles, and few insects. Hair and fur seals, and sea lions, of the most valuable description, are abundant in the vicinity of the Jason Beauchêne, and the smaller islands adjacent to East and West Falkland. The black, or right whale, still visits these coasts, especially the south and west shores of West Falkland, though much diminished by the annual attacks of the numerous whale-ships, both large and small, which have made these islands their head-quarters for the last five-and-twenty years.

The animals introduced have thriven well. Large herds of wild cattle range the uninhabited wastes, the produce of a few tame ones brought by the French settlers

in 1764. They have rapidly increased; and the present stock consists of a nearly equal number of bulls and cows. These are magnificent looking beasts, resembling those which are figured in ancient sculptures, where the size of the head and neck is so remarkable. They wander about by themselves, or with two or three companions, and the solitary ones are very furious, never hesitating to attack a man, unless mounted, and delighting in the encounter.

The method of hunting and capturing wild cattle, which is adopted on the dry and level Pampas of South America, being found unfitted to the soft and uneven "camp" of the Falklands, the use of the lasso is almost discontinued. The most efficient mode, and that now generally adopted, is to drive sinuellas (or trained decoy oxen) near to the wild herds, some of which are then separated, by dint of hard riding, seconded by the exertions of the sinuellas, who, when once joined by a few wild animals, lead the way to the nearest hunting corral or walled fold, closely followed by the horsemen. Once within the enclosure, their savage spirit is soon broken down under a course of starvation and constant discipline, and in a very short time they become sufficiently tractable to be driven in herds of fifteen or twenty by a single horseman, and are then considered tamed. In the old plan of catching them, the gaucha or cattle hunter flung his lasso (a long cord with a noose at the extremity) round the horns of the beast, and threw him to the ground, then rapidly dismounting (his horse, trained to the work, keeping the lasso meanwhile at full stretch) tied the legs with thongs of raw hide; sometimes the assistance of a second gaucha was required to throw another cord round the hind-leg. The poor animal was then left on the ground, and the pursuit continued until as many others were captured as the party could manage in a day. On the following morning, exhausted by the chase, by violent struggling with their bonds, and by hunger and thirst, the wretched beasts were released by their captors, who, riding rapidly round them, brought them together, and urging them with voice and spear, hunted them furiously in the direction of the corral. Still without water, and further harassed by the pace, it will be easily understood that the dominion of man was soon established over them. However, the great destruction of cattle and horses resulting from this barbarous system, has caused it to be almost

abandoned in the Falkland Islands. As it is, the service is sufficiently severe; the men lie out for three weeks together, with the earth for a bed, a saddle for a pillow, and covered only by their pouches, after a day's hard riding, equivalent in exertion to half-a-dozen hard runs with a fox in England; the horses reeking with sweat, their withers wrung by struggles with powerful bulls, flanks dropping blood from the effects of the sharp rowels of the gaucha's spur, and jaws almost broken by the severe and heavy bit, are turned adrift at night to seek their food and water as best they may. The consequences are that the men suffer a good deal from rheumatism, and the horses seldom last more than three or four seasons.

The size and fatness of the wild cattle indicate that the breed is good, as well as the pasturage rich. Some are so fat and heavy that they cannot be driven across marshy grounds, which are passed by other cattle, as well as by men on horseback. Of twenty wild bulls which were killed during one excursion of the settlers, while Captain Fitz-Roy was at East Falkland, the average weight of each hide was above seventy, and a few weighed eighty pounds. Meat takes salt remarkably well in this climate, and salt abounds on the coast of Patagonia. The flesh of the wild cattle is good eating; Dr. Darwin says that the meat roasted on the embers with the skin on it, the hide downwards to serve as a saucer for the gravy, is as superior to ordinarily dressed meat as venison is to mutton. After picking the flesh from the ribs of a bullock, the meat is roasted by making a fire with the bones of the animal.

There are troops of wild horses which, like the horned cattle, owe their origin to some introduced by Bougainville in 1744. These are even more dangerous of approach than the cattle, as they fight in a body, using in the onslaught their fore-feet, and biting with their teeth. They have never left the northern part of the island; it is difficult to conjecture why, as it does not appear more tempting than any other portion. They have increased greatly in numbers, but degenerated in size, being a small breed, which necessitates the importation of fresh horses from South America. When found of suitable strength and shape, the island horses are however preferred to the imported ones, from being accustomed to the description of country. An English stallion has been taken out by Captain Sullivan, the

only one in the colony. A quantity of pigs and rabbits were turned loose upon East Falkland, by the French, and afterwards by the Spanish colonists, and by considerate persons engaged in the whale or sea-fishery; both goats and pigs have been left upon the smaller islands near West Falkland. These have multiplied exceedingly; and although they have been killed indiscriminately by the crews of vessels, as well as by the settlers, there are still large numbers, especially upon *Carcass Island*, and *Saunders Island*. The black and the grey description of rabbits, by breeding together, have produced a piebald offspring. Rats and mice are found, having probably been introduced by some of the earlier navigators; altered climate, food, and habits, sufficiently account for their peculiarities of colour and size, their sharp noses and long tails.

BIRDS.—Of sea-fowl there are many kinds; of land-birds, few, a natural consequence of the absence of trees. Swans, wild ducks, snipe, teal, and a sort of quail, are found in abundance; and so tame were some of the birds when the first settlers landed there, that they would suffer themselves to be caught by the hand, and often perch upon the head. There is a bird called the grebe, of beautiful plumage, with a peculiarly gentle note, whose flesh is much esteemed, which suffers itself to be approached so as to be knocked down with a stick; there are also falcons, snipes, owls, curlews, herons, thrushes, &c. Two kinds of wild geese are distinguishable, the lowland or kelp-geese, and the upland geese; the latter are much superior in flavour, the former having a fishy taste, living chiefly on mussels, shrimps, and kelp. Both are very tame, and the upland geese are easily domesticated. They are the finest eating in autumn, being then plump, in consequence of the abundance of the tea-shrub berries, of which they are very fond; the rest of the year they live on the short grass. They have a white neck and breast, with the rest of the body speckled of a fine brown marbled colour. The lowland gander is quite white, and the goose, dark, with a speckled breast. Of ducks there are several kinds. The loggerheaded are the largest, and almost the same size as the geese; their flesh is tough and fishy; they cannot fly, and when cut off from the water are easily caught. The next size is also of inferior quality, tough and fishy, but the smaller kinds, which are not larger than young

pigeons, are very good, and are found in large flocks along the rivulets and fresh-water ponds. In addition to these, a variety of sea birds frequent the shores, of which the most valuable to sailors and settlers, from the quantity of eggs they deposit, are the gulls and penguins. These birds have their fixed rookeries, to which they resort in numerous flocks every spring; the gulls generally in green places near the shore, or on the small islands in the bay; the penguins chiefly along the steep rocky shores of the sea. (See illustration on map.) The eggs of both are eatable, after long confinement on board ship; the penguin's being, however, the better, and less strong than those of the gull. They were formerly so numerous, that on one occasion eight men gathered 60,000 in four or five days, and could easily have doubled that number had they stopped a few days longer. Both gulls and penguins will lay six or eight each, if removed, otherwise they only lay two and hatch them. The gulls come first to their hatching places, the penguins a little later.

FISH.—A valuable source of daily supply, and by salting, of export, exists in the inexhaustible quantities of fish that swarm in every harbour during the summer. The description which most abounds is a kind of bass, from two to three feet long, and six inches in depth; there are also several sorts of excellent small fish in immense shoals, which enter the bays at the beginning of spring to spawn, and retire in the winter season. A species of grey mullet, weighing from one to fifteen pounds, may be caught in large quantities in every creek; also a fish resembling a smelt; with both these, salt and fresh, shipping are supplied. Rock cod is plentiful in the neighbourhood of Swan or Weddell Island; but the prodigious quantity of sea-weed with which the shore is loaded, renders coast fishing almost impracticable. In the numerous fresh-water ponds, a small but good fish may be caught by angling. Large clams and mussels are obtained in abundance; there are, however, few other shell-fish, except some whose appearance is owing to a remarkable phenomenon connected with the tides: just before high water the sea rises and falls three times; and this motion is always more violent during the equinoxes and full moons, at which time several corallines, the finest mother-of-pearl, and the most delicate sponges are thrown up with it; and amongst other shells, a curious

bivalve, called *la poulette*, found no where else save in a fossil state.

POPULATION.—No aborigines were found inhabiting these islands. In 1849, the population consisted of *whites*, 184 males, 124 females=308: *coloured*, 2 males, 1 female=3. The aliens and resident strangers, not included in the foregoing, numbered 104, of whom more than 90 are Spaniards and South Americans, introduced by M. Lafone. During the year the births were 12; the deaths, 4; the marriages, 1.

The inhabitants are variously employed in capturing and taming cattle, in gardening, in trade, and on public works. The division of the Eastern Island into two counties has been already stated; in the northern is the parish of Stanley.

GOVERNMENT.—There is an Executive Council, composed of the governor, colonial-surgeon, and a post captain in the Royal Navy: the Legislative Council consists of the governor and five gentlemen, three of whom hold no official position.

The government establishment comprises the following officers, whose respective salaries are as follows:—governor, £800; stipendiary magistrate, £400; colonial chaplain, £400; surveyor-general, £300; his first clerk, £200; second clerk, £150; colonial surgeon, £300. Total, £2,550.

RELIGION.—The chaplain, in addition to his salary of £400, has a house and garden-ground around, but no church or chapel; the school-room, where about forty persons usually attend, is set apart on Sundays for public worship.

EDUCATION.—There is a schoolmaster, with £32 a-year from government, and about £20 a-year from the parents of his scholars, who were in 1849, 14 males, 14 females=28.

CRIME.—Only 8 prisoners were committed to the temporary gaol during 1849, 4 English and 4 Spaniards.

FINANCES.—The only taxes levied in 1849, consisted of *spirit* licences, at the rate of £20 per annum, payable half yearly; and *dog* licences at 5s. each, which produced in 1849—spirit, £30; dog, £11=£41. The land sales in 1849 yielded £125, and the land revenue £18. The legal and registration fees are numerous and petty; they yielded £90. The total revenue is under £300 a-year. In 1849, the sale of government property yielded £713; reimbursements on account of expenses incurred by government, £196; and the special receipts,

including a forfeiture of £360 for breach of contract with colonial government, amounted to £543; sums received on account of parliamentary grant, £344. The receipts for the year from all sources, were £1,453. The expenditure for the salaries of governor, magistrate, chaplain, surgeon, surveyor, first and second clerks, and schoolmaster, for 1849, was £2,358; provisional and temporary establishments, £1,652; allowances for rations, £40; disbursements on account of miscellaneous civil services (including £742 on works and buildings), were £960; special payments, including remittances to land and emigration commissioners, &c., £331; payments on account of detachment of military enrolled pensioners, £120. The total charges for 1849, amounted to £5,463. In 1850, there was a general increase of revenue; the fixed items increased from £184 in 1849, to £442 in 1850. The circulating medium of the colony is principally English coin, whose amount is estimated at £2,500.

COMMERCE AND SHIPPING.—Imports in 1849, £9,760, of which £7,100 came from England; and of this, £3,200 in value, were imported for the public service. The imports consisted chiefly of clothing, articles of domestic use, spirits, wine, beer, &c.; and from America, breadstuffs, timber, tobacco, sugar, coffee, &c. The exports were valued at £2,660, consisting of hides, hair, fur seal-skins, seal-oil, whalebone, &c. Number of hides exported, about 1,300; wool, 850lbs.; hair seal-skins, 1,046; fur, ditto, 37; whalebone, 370lbs.; seal oil, 140 gallons.

The following summary of the shipping which has called at Port Stanley, East Falkland, between May, 1847, and June, 1851, shows a progressive increase, particularly in the present year. There is every reason to anticipate a continuous and yet more rapid augmentation, from the advantages offered by this and other harbours of the Falkland, as ports of refuge, offering, on easy terms, the means of refit and refreshment, so frequently required in doubling Cape Horn:—

Date.	Ships.	Tonnage.

1850 " "	36	13,881
1851, January to June " .	31	10,699
Total	135	47,684

Of which there were :—

Country.	Ships.	Tonnage.
British	65	28,681
North American	51	13,933
Norwegian	2	756
Danish	3	660
Oriental	8	827
Hamburg	2	527
Chilian	1	400
French	2	1,500
Russian	1	400
Total	135	47,684
Deduct men-of-war	11	8,199
Merchantmen	124	39,485

Object of calling.—40 ships, for service of the islands; 74, for water and provisions; 26, for repairs; 19, American whalers, for repairs and provisions; 3, with goods for sale; 2, for deserters; 4, for medical aid; 2, wrecked; 2, for repairs—condemned; 1, run aground, and abandoned on fire.

Men-of-war included amongst the foregoing.—In the year 1847, none; 1848, 5 English and one French, 4,510 tons—2, for repairs and refreshments; 1, surveying for patent slip at Stanley; 1, with despatches for Governor; 1, with new Governor (Rennie); 1, French, for deserter: 1849, 3 English, 2,130 tons—1, with specie for government; 1, for refreshments; 1, for repairs: 1850, 1 English, 503 tons—for repairs, beef, and water: 1851, 1 English, 1,056 tons—with specie, and took refreshments. Total, 11 ships, 8,199 tons.

PRODUCE.—The amount is yet very limited; in 1849, there were only 5 acres in cultivation, and these in garden produce, viz.: potatoes, cabbages, turnips, peas, &c. About 5,300 acres are fenced in and planted with *tussac* grass. The live stock is large: wild horses, about 3,000; wild cattle, 80,000 to 100,000; two troops of breeding mares, and numerous swine; imported and tame horses, between 600 and 700; tame horned cattle, 3,000; sheep, 500; goats, 30. Only 12 milch cows are kept on the island, more not being required. The price of beef is 2*d.* per lb.; Stanley-fed bacon, as good as English, 1*s.* 2*d.*; fresh butter, 2*s.*; milk, 6*d.* per quart; tallow candles, (colonial manufacture) 10*d.* per lb.; cheese, 1*s.* 6*d.*

Wages—of unskilled labour, 2*s.* 6*d.* to 4*s.* 6*d.*; mechanics, 5*s.* to 8*s.* per day; domestic servants, male, £30 to £40; female, £10 to £20 per annum.

PRESENT POSITION.—By a contract between Her Majesty's government and Mr. Lafone, the latter (a wealthy Monte Video merchant), on payment of £30,000—of which £10,000 has been paid—is entitled to hold, in fee simple, the whole of the south peninsula in East Falkland Island,

DIV. VI.

estimated to contain 600,000 acres, with all the adjacent islands, including Beauchêne, besides 25 acres of suburban land, and half-an-acre of town land at Stanley. He has, also, till 1856, the absolute right to exclusive dominion over all wild cattle, horses, &c., on all the Falkland Islands, with full power to dispose of them as he pleases; and after that time, all stock, &c., found on Lafonia, are to be his, absolutely; but his dominion ceases as to the rest of the islands. He has also some other privileges under his grant from the Crown.

Government have sanctioned the transfer of Mr. Lafone's contract to a company which has been lately formed under the title of "The Falkland Islands Company," and to which a charter of incorporation is about to be granted. The primary object of this association is to turn to profitable account the immense herds of wild cattle, which have been estimated, by competent judges, at 80,000 head; though Captains Sullivan and Mackinnon make the number still larger. Government are about to contract with the Company for the transport of a mail eight times a-year, between Stanley and Monte Video, for which service they are to receive £800. Hitherto there has been no regular means of communication with the colony. The establishments created by Mr. Lafone are now to be transferred to the Company; the principal are situated in Darwin's Harbour, on the Isthmus, at Port San Salvador, and at Port Louis; amongst other works, he has constructed a wall and ditch, 2,225 yards in length, across the isthmus, thereby preventing about 30,000 head of cattle, which he has in Lafonia, from straying into the northern portion of the island. To give an idea of the extent of this establishment, which is entirely occupied in the capture and taming of wild cattle and horses, it may be mentioned, that the studs at the various stations comprize upwards of 400 horses.

The crection of a beacon, or lighthouse, on Cape Pembroke, is much needed, to enable vessels to make Stanley Harbour in thick weather and in the night-time. Government have had it in contemplation, for some years, to send out a patent slip, for which there is great occasion, as appears by reference to the summary of shipping previously given. An excellent chart of these islands is published by the Admiralty: they

have been very carefully surveyed by Captains Fitz-Roy, Sullivan, and Robinson; and masters of ships, provided with this chart, may call, with the simple addition of the lighthouse, at any season, in perfect safety, at Port Stanley, where fresh provisions and water, of excellent quality, are plentiful and cheap.

These islands seem to offer advantages for a convict dépôt.* They certainly afford facilities for separation and classification of the prisoners, who might be disposed so as not to interfere with the existing population. There is no bush to shelter runaways; or, should they escape—which appears to be the principal objection—the nearest

land, Patagonia, is inhabited by savages, amongst whom they would meet with certain destruction. The conformation of the islands affords a ready means of communication by semaphoric, in ten minutes' time, from New Island to Cape Pembroke, the extreme west and east points of the group. The cost of transport would be less than half that to Van Diemen's Land; and staple provisions might be had, quite as cheap as at any other colony; beef and mutton at much lower rates; whilst ample employment might be afforded, in various ways, serviceable to the colony, and adapted to make it, what nature seems to have designed it for, a useful naval station.

THE AUCKLAND ISLANDS.

THIS group, consisting of one moderate sized island, and several smaller islets and rocks, is situated in 51° S. lat., 166° E. long. It lies 180 miles to the south of New Zealand, with which it is supposed to be connected by means of a submerged mountain-chain, whose summits form the rocky islets, called by Cook the *Snares*, a few miles off the extremity of Stewart's Island, and may be traced as far to the southward of the Aucklands as the *Macquaries*. A similar connexion is thought to exist between New Zealand and the Chatham Islands, 300 miles to the eastward, on account of the declaration of the whalers that soundings are found the whole of the intermediate distance. It is also affirmed that a bank extends from the "Three Kings," off the northern extremity of New Zealand, to Norfolk Island; these statements tend to confirm the opinion of Dr. Dieffenbach and others, that the various scattered groups of which we are now speaking, are the mountain regions of an extensive continent, whose lowlands have long been covered by the stormy waters of the Southern, or miscalled Pacific, Ocean.

The Auckland Islands were discovered in 1806, by a Captain Briscoe, while engaged in the prosecution of a whaling voyage, on behalf of the late Mr. Enderby; in the subsequent year he landed, took possession of them for the crown of England, and left thereon some pigs, which have multiplied exceedingly. In 1847, on the application of Messrs. Enderby, a London mercantile

* They have been recommended for this purpose by the Colonial, Land, and Emigration Commis-

sioners, then largely engaged in the South-Sea whale and seal fisheries, a lease was granted to them of the Aucklands by the Crown, for the term of thirty years, at a peppercorn rent for the first two years, and for every subsequent year of the time specified at the rate of £1,000, and such further sums of money as one of Her Majesty's secretaries of state might deem necessary for the civil government and protection of settlers upon the islands. By the terms of the lease, the Crown may at any time resume possession, granting compensation only to the actual value of improvements made; and may also select land for the construction of houses and gardens for the residence of official persons, or for barracks, forts, arsenals, dock-yards, military defences, roads, bridges, &c. It is likewise stipulated that the ships and merchants of all nations shall have the free use of the ports and harbours of the said islands, according to the usual laws and customs of trade: the Crown may remit any portion of the yearly rent of £1,000, not required for the purposes of government or protection; the failure of payment of rent after an arrear of six calendar months to be considered a breach of the covenant, and be deemed sufficient cause for the forfeiture of the lease.

There is a proviso for the extension of the lease over a second period of thirty years, on nearly similar terms to the first, and generally the grant was made on favourable conditions for those who engaged in the adventure, it being the object of the Government to encourage settlement. See Parliamentary Paper, No. 3. August 27th, 1841. Enclosure, No. 7.

of Her Majesty's ministers to encourage the prosecution of whale, seal, and other fisheries in the Southern Pacific.

The Messrs. Enderby have sub-let their lease or grant to a public association, called the "*Southern Whale Fishing Company*," under the governorship of Captain the Earl of Hardwick, R.N., and a direction of experienced city merchants and other gentlemen. The Company has a capital of £100,000, of which, in conformity with the provisions of a royal charter granted in 1848, one-fourth was required to be paid up before the Company commenced business.

Several vessels have been built for the Company, and despatched to the South Seas and Pacific for the prosecution of the fisheries; and Mr. Charles Enderby has been sent out for a period of ten years as the Company's commissioner and lieutenant-governor of the islands. The remuneration of this gentleman was to be a per-centage upon the annual net profits of the undertaking, with a guarantee from the court of directors that he should not receive less than £500 per annum, with an allowance £250 a-year for table money, to enable him to entertain the commanders and officers of vessels touching at the islands. Other persons, some with their wives and families, have been located at the Auckland; and stores of various kinds, with cattle, seeds, &c., have been imported.

Dwelling-houses, stores, jetty, &c., have been constructed; a survey of the principal island has been made, and every care seems to have been taken by the corporation to supply the physical wants of the people under their charge, save and except in the first of all requisites, a provision for their spiritual necessities. No clergyman has been sent out by the London directory, and though it is to be hoped some of our excellent missionary societies will remedy this lamentable defect, it is yet most unjust that the onus should be thrown on them, which in common justice ought to be borne by those who hope to reap advantage by the undertaking; nor is it possible to acquit the government of their responsibility of either performing or ensuring the performance of so necessary a duty.

AREA AND PHYSICAL FEATURES. — The principal island, named Auckland, is estimated to comprise a superficies of about

100,000 acres; its length is thirty miles, and its extreme breadth about fifteen; the remainder of the group does not contain in all more than 20,000 acres. The general appearance of the country somewhat resembles the region round Cape Horn; it is mostly wild and steep to seaward, the basaltic cliffs rising from fifty to ninety feet in perpendicular height. Its southern and eastern shores are indented by deep gulfs, one of which almost separates the island into two parts. Of these the southern is the more picturesque, and is supposed to be also more fertile. The smaller islands, which are divided by narrow channels, closely resemble the large one in their general character. The land rises abruptly, especially on the east coast, and the highest peaks attain an elevation of about 900 feet. So far as is yet known there appears to be a succession of hills and narrow valleys, clothed in many parts with trees of a very hard and crooked nature; in others with a dense growth of underwood; and, where the rays of the sun can penetrate, with a strong heavy luxuriant grass. The western side of the island is a bluff "iron-bound" coast, with deep water within 100 fathoms of the cliffs; the eastern is partly lined with fine pebbly or sandy beaches, intersected by streams and inlets, and has six or seven harbours, the principal of which, now termed *Port Ross*,* in 50° 32' S. lat., 166° 12' E. long., was formerly known as *Rendezvous Harbour*. The entrance, sheltered to the northward by *Enderby* and *Rose Island*, is about a mile wide, has to the southward a rock called *Ocean Island*. The portion at the head of Port Ross or Rendezvous, called *Laurie Harbour*, is perfectly land-locked, with a steep beach on the shore, affording facilities for clearing and loading vessels. That known as *Sarah's Bosom* is less secure.

Mr. Enderby, who reached Port Ross as lieutenant-governor and commissioner for the Southern Whaling Company, 2nd December, 1849, and took possession of the islands on its behalf, was piloted in by a New Zealander: he describes the sides of the harbour as steep, the contiguous hills varying from six to nine hundred feet in height, covered from the base to the summit with trees, whose branches overhung the water on either side. Near the head of the haven is a small island about five acres in extent, covered with grass, and beyond it a

* So called after the distinguished navigator, Sir James Clark Ross, who, in his arduous and perilous

expedition to the Antarctic Seas, surveyed these islands.

wide and rapid stream, the entrance to which is almost hidden by trees and brushwood. The site of the projected town, to be named Hardwick, includes three small bays. It is situated on a peninsulated piece of land extending about a mile inland, having a gradual rise in that distance of about 100 feet, and a rivulet of fresh water running through it, and is sheltered from the prevailing winds by high land rising in the back ground. The only extent of grassland in the vicinity of the settlement is a tract of about 100 acres, situated at the north of the main island; nearly the same quantity of natural pasturage is comprised in Enderby Island, and a smaller amount exists on Rose Island; with these exceptions there is no one spot containing ten acres together.

Carnby Harbour, the great southern haven of Auckland Island, lies four miles to the eastward of the South Cape, within the strait dividing Auckland from Adam Island; it is tortuous, capacious, and in some places too deep for anchorage; there are, however, several good coves on either side where ships may lie. The entrance is perfectly free from danger, and about five miles wide; it is formed by two bluff points; from thence to the head of the haven, fifteen miles distant, (of which nine miles are direct inland,) a wide expanse opens with twenty-five to four fathoms clay soundings near the shore.

Chapel Bay, also on the east side of Auckland Island, received its name from a hill on one side, with a projecting rock on its summit, resembling a chapel: it is half-a-mile wide, and three miles in length; the sides rise to a height of eight or nine hundred feet, covered with trees. At the head of the bay is a rapid stream, flowing through a fine piece of level ground, extending inland for a mile, part being thickly wooded, and the remainder covered with grass and low shrubs. Beyond this is a waterfall, of seventy or eighty feet in altitude, which falls into a circular basin of clear fresh water, about half-a-mile in diameter. There is not a weed on the surface, nor any swampy ground around; and it is probably, therefore, of considerable depth. The banks are shelving, and composed of loose pieces of basaltic rock. Near the entrance of Chapel Bay is a remarkable and beautiful grotto; and, close to it, a cavern, 200 feet deep.

The interior of Auckland has been but little explored, the dense vegetation ren-

dering travelling almost impracticable, except where fire has been used to clear the way. The prevailing features, both of this and the smaller islets, would seem to be, a low forest skirting the shores, surmounted by a broad belt of underwood, above which a species of long, coarse grass, fern, or low bushes, extend to the summit of the hills. *Ewing*, and some of the other islets, are entirely covered with wood.

GEOLOGY.—The character of the country is described as basaltic, with the stone running into columns. Whin, or green-stone, has been found, of a fine workable grain. At the settlement, the igneous formation is intersected by a clay-coloured wacke, formed by the detritus of the adjacent rocks.

MINERALOGY.—No report has yet been made on this head.

SOIL.—In most places peaty, varying in depth from a few inches to ten feet. Some of it, sent to England for analysis, has been considered peculiarly valuable for floriculture, and worth, for that purpose, several pounds a ton. Cattle evidently thrive well on the natural grasses. How far the cultivation of grain will succeed, is yet to be proved.

CLIMATE.—Considering the high southern latitude, the temperature is mild; but there are frequent high winds, attended occasionally with heavy rains. The snow, in winter, is sometimes exceedingly heavy, but it seldom continues on the ground above a few days at a time. In summer, the thermometer rarely rises higher than 78° Fahr. The climate is salubrious, and is well spoken of, even by the scantily-clothed New Zealanders, who have had eight years' experience.

VEGETATION.—The surface of the main island is thickly covered with trees, shrubs, fern, grass, and moss. Of the trees there are several species; but the two most numerous are the *metrosideros lucida*, called "rata" by the New Zealanders, belonging to the *myrtaceæ*, and the *panax simplex*, belonging to the *ficoideæ* family. The principal shrub is a fine species of veronica, which occasionally forms a beautiful feature in the landscape. According to Mr. Enderby, the growth of the trees is peculiar. He describes them as rarely reaching an elevation exceeding forty feet, and yet as frequently measuring sixty feet in length; the cause of this seeming contradiction being, that "almost every tree is bent down about twenty or thirty feet from the roots,

and again shot upwards." This circumstance renders the forest almost impassable, as the passage is obstructed in all directions by these trees, over and under which the traveller has alternately to make his way: the tops are everywhere covered with foliage, as thick and even as a well-trimmed hedge.

An ornamental tree, yet undescribed by botanists, is found growing on the small isle situated to the south-east of the entrance to Port Ross, called *Ewing Island*.* The stem varies from eighteen inches to two feet in diameter; the wood is very hard, and has much the appearance of maple; the blossom resembles that of the chesnut in form, but is of a dull leaden colour; the leaves are nearly as large as those of the fig-tree, their back and the young stems are covered with a white film-like cotton; the branches spread out from close to the ground, to a distance of twenty-five feet.* Many of the smaller vegetable productions of these islands offer subjects of very interesting inquiry to the botanists, for though limited in extent, the recent investigation by Dr. Hooker, of the plants collected by Sir J. C. Ross, shews that of eighty flowering species found, no less than fifty-six were until then undescribed. One half of the whole are peculiar to the Aucklands, so far as is at present known, and are no less remarkable for their beauty than novelty. Space does not permit any details on this head, with the exception of the *arabisa polaris*, one of the most singular and useful plants found on this group: it grows in large orbicular masses in rocks and banks near the sea, or amongst the dense and gloomy vegetation of the woods; its copious bright green foliage and large umbels of waxy flowers have a striking appearance. The whole plant has a heavy and rather disagreeable smell, but its roots are greedily eaten by pigs, goats, and rabbits, who frequently live entirely amongst it, and by trampling down the soft stems and leaves make warm places to litter in.

ZOOLOGY.—There do not appear to be any native animals whatever. Some pigs which were left in Auckland, and about fifty brought by the Maori immigrants, have increased considerably, and on Ewing Island there are

also several droves. Cattle, sheep, and horses have been recently introduced, and there is said to be abundant feed all the year round for several hundred head on Enderby Island alone. Fur and hair seals frequent these shores; the male of the latter species, called the *sea lion*, is as high as a bear, and progresses nearly as fast as a man can run; he is usually attacked with thick clubs, loaded at one end,† and not unfrequently contests for life with his destroyer. The black or right whale is mentioned by Mr. Enderby as coming into the bays to calve, during the winter, in considerable numbers, and the hump-backed whale as being a constant visitor;† he also speaks of having obtained excellent flounders, and an inferior description of crab, and describes the mussels as being like seams of coal, of all sizes, and equal in flavour to the finest oysters. Of birds, insects, or reptiles, we have yet no detailed accounts, but there appear to be three sorts of ducks, snipes, sand-larks, and several small birds, including the "tui" of New Zealand (see p. 353), and a green paroquet, with red on the head and wings. Albatrosses of great size and beauty have been captured. The ground in several places is perforated, probably by the mutton bird; hawks are numerous.

POPULATION.—When Mr. Enderby, the lieutenant-governor, and commissioner of the South Whale Fishing Company, arrived at Auckland in 1849, he found the islands inhabited by about seventy New Zealanders (men, women, and children), who lived under the jurisdiction of two chiefs named Matteoro and Nannaterri. They had been dwelling there about eight years, having been conveyed thither from Chatham Island in a colonial vessel. They paid 150 pigs for their passage, and brought fifty more with them, which they landed on Auckland, Enderby, Ewing, Rose, and Ocean Islands. They had many small plots of land under cultivation, which they surrendered with their pigs, &c., to the representative of the Company, in whom the islands were vested by the Crown, in consideration of receiving a small sum of money, and of being permitted to collect their growing crops. They were unwilling to quit the island, and the commissioner, so

* Abstract of reports of the commissioner of the Southern Whale Fishery Company to the directors. London, 1850; p. 16.

† The latest report, dated June, 1851, which I had not seen at the time of writing the above remarks, states that "the Bay whaling season (of 1850-51) at

the Islands, had not realised the expectations entertained by the commissioner (Mr. Enderby)," and that but few black whales had been seen. The following was the population in January, 1851:—White population, exclusive of seamen—men, 49; women, 19; children, 26; total, 94. Births, 8; marriages, 3; death, 1.

far from desiring their removal, considered their presence decidedly advantageous to the Company; he found them "strictly honest and willing, and also able boatmen, whilst some of them have been engaged in the whale fishery." Several were employed at a low rate of daily wages, others by cultivating the land, supplied the settlement with potatoes, cabbages, and Swedish turnips. The two chiefs were appointed constables, in which capacity Nannaterri is entrusted with the charge of refractory seamen. Matteoro resides with forty of his people near the settlement, and is described in one of the commissioner's despatches as being "constantly employed working and looking after those under his command."

On one occasion complaint being made to him of a sheep destroyed by his dogs, he executed summary justice by causing seven of them to be hung up immediately. By a recent report (February, 1851) of the directors of the Southern Whale Fishery, we learn that the population, including the commissioner, a surgeon, and a few persons in the immediate employ of the Company, amounts to about seventy persons; that a permanent jetty and wharf, a warehouse, governor's residence, and some double cottages had been built, the brickwork for a cooperage finished, and a jail erected on Shoc Island. A savings' bank had been established, and deposits to the amount of £100 already lodged in it. No provision appears to have been made either for the religious or secular instruction of the settlers—a radical defect in any scheme of colonization, and one that cannot be too soon remedied.

PRESENT STATE AND PROSPECTS.—Whether the settlement of the Auckland Islands will fulfil the purpose for which it has been designed, that is, to form a nucleus for promoting, or rather reviving, the South Sea Whale Fisheries, and in so doing succeed as a commercial speculation, is yet to be proved. Having seen both the sperm and black whale between the Seychelle Islands and the northern end of Madagascar, in the China Sea between the coast of Siam and Borneo, and in other tropical climes, I am disposed to think it too uncertain in its migrations in search of food and quiet spots to breed in, long to frequent any locality where it is extensively hunted, unless indeed great precautions are taken, and the exterminating system of shore-whaling pursued in New Zealand at once abolished. The Aucklands, however, from recent accounts appear to be at

present frequented both by whales and seals; and their contiguity to the islands near the South Pole is a decided advantage in this respect. A limited population may therefore be enabled to earn a comfortable livelihood with the more ease, if the islands, as is believed, afford an arable area amply sufficient for their support. The secretary of the South Whale Fishing Company, and one of its directors (Mr. Dundas) are now engaged in prosecuting further inquiries and exploring the country; and as far as the national interests are concerned, it appears unquestionably desirable that the Company should avail themselves of the thirty years' lease of occupation granted by the Crown.

CAMPBELL ISLAND, a little to the south-east of the Auckland Islands, in $52^{\circ} 40'$ S. lat., $169^{\circ} 5'$ E. long., was discovered in 1810 by the master of the ship *Perseverance*. It is uninhabited, and only occasionally visited by whalers and sealers, who describe it as about thirty miles in circumference; the coast bold and rocky, the interior elevated, some peaks attaining a very considerable height, the loftiest being of a conical shape, and rising in a straight line from the surrounding mountains; the amount of vegetation appears to be considerable, but the trees are all of stunted growth.

MACQUARIE ISLAND, in $54^{\circ} 35'$ S. lat., $158^{\circ} 56'$ E. long., the most southerly of the Australasian groups, is likewise uninhabited. It was discovered in 1811 by a sealing master, who procured a cargo of 80,000 seal-skins. It is between fifteen and twenty miles long, about six miles in breadth, and is reported to possess two open anchorages. Notwithstanding the high latitude, the island is covered with vegetation; the land is uneven, indented by bights and ravines. A little distance to the northward lie two rocky islets, and there are two or three others equally sterile to the south.

ANTIPODES ISLAND, a small unexplored tract, situated in $49^{\circ} 50'$ S. lat., $179^{\circ} 40'$ E. long., to the east of New Zealand, was discovered by Captain Pendleton, of the sealing vessel *Union*, in 1800, and received its name from its position with regard to London.

The **BOUNTY GROUP**, in $47^{\circ} 44'$ S. lat., $176^{\circ} 47'$ E. long., comprises thirteen islets, covering an extent from north to south of three miles and-a-half. The discovery was made by the celebrated Captain Bligh, R.N. in 1788, when on his passage to Tahiti.

CHATHAM ISLANDS.

THIS small group extends about 120 miles from south-east to north-east, between 43° 38' and 44° 40' S. lat., and 177° and 179° W. long., and lies about 300 miles to the eastward of Cook's Straits. It was discovered on the 23rd of November, 1791, by Lieut. Broughton, R.N., when proceeding with Vancouver to survey the north-west coast of America. Broughton anchored in the bay on the north side of the chief island, landed and took nominal possession of the archipelago, by right of discovery, in the name of his sovereign George III. His proceedings displeased the aborigines, (a race very similar to the people of New Zealand,) and a contest ensued in which two Englishmen were wounded, and one native was killed. Broughton and his companions then returned to their boat, leaving behind, in a canoc, the trifling presents they had brought with them as a token of their peaceful intentions.

The sovereign right of England, according to the custom of civilized nations (the *equity* of which it is not here necessary to discuss) was thus established as against any other European power, much more as against its own subjects, who by the first principles of the British constitution, cannot acquire territorial jurisdiction and sovereign power in any waste or newly discovered region, unless expressly authorised by their sovereign. Notwithstanding this well-known rule, the New Zealand Company, which had been incorporated solely for the purpose of buying and selling land in New Zealand, conveying emigrants thither, and forming a settlement there, endeavoured to set aside the rights of the Crown in the Chatham Islands, almost as unceremoniously as they had done in the case of the Maories at Port Nicholson.

On the 28th of October, 1841, the directors announced to Lord Stanley that they had "acquired the Chatham Islands by purchase from the natives, and that they considered this group, to all intents and purposes, a foreign state, ruled by native chiefs, who have the undoubted right to cede their sovereignty to any foreign power they may think proper." The directors, therefore, deeming it not advisable that the Chatham Islands should any longer remain in the "*exclusive possession of their present barbarous inhabitants,*"

proposed to make a profit of them by selling the sovereignty and property in the soil of the whole of the islands to "certain parties officially connected with Hamburgh and other free cities of Germany." The concurrence or sanction of Her Majesty's ministers was not asked; they were merely informed, as an act of courtesy, that the "treaty" for the "transfer" of the territory to be placed under the "national flag of the Hanse Towns" was in progress.*

Lord Stanley took in this instance, as in all others, the straightforward and uncompromising course, best adapted to defeat these and similar aggressions, by referring the matter to the crown lawyers, who described it as wholly unauthorised by the charter of the Company, declared their proposed "treaty" "an interference with the royal prerogative, and therefore unlawful; the possible inconvenience and dangers of such a course being quite obvious." His lordship, in communicating this opinion to the Company, added—"the crown lawyers have further reported their opinion, that the consequence of an abuse of the trust created by a charter, or of the powers thereby granted, may be the forfeiture of the charter altogether." Upon this the directors changed their tone, declared that no transfer had taken place, that it was merely a private transaction, and that they would abstain from any objectionable or illegal proceedings. In order to prevent a similar attempt, the islands were included as a dependency under the protection of Her Majesty's government at New Zealand, and comprised within the diocese of Bishop Selwyn, who has visited them several times.

AREA AND ASPECT.—The largest of the archipelago, *Chatham Island*, is about thirty-six miles long from east to west, and has an area estimated at 600,000 acres. The others, viz., the *Two Sisters*, *Pyramid*, and *Cornwallis*, are of much smaller dimensions. In Chatham Island, the land gradually rises from the sea coast towards the interior. Its general character may be seen in a few minutes' walk from the beach. A large salt-water lake, called "Whanga," occupies about one-sixth of the island, and is not less than twenty miles in length: it has an opening to seaward, on the east coast,

* Parliamentary Papers on New Zealand, 12th August, 1842; pp. 31-35.

but the water is too shallow to admit vessels. The other principal lake is named *Huro*, but it is greatly inferior in extent. Small copses of low bushes lie in the vales, between swampy hills, which pour their drainage into the lakes, and form the leading features of the landscape. The flat levels are everywhere intersected by marshy creeks, which serve as canals for the conveyance of produce.

The view from a hill near Rakautahi, over the Whanga lake, with two bold hills at its western extremity, is pleasing, without being striking or grand. If the whole island were cultivated, its gentle hills and slopes, and the variety of tarns and pools, would give it a soft and domestic character.* Much of the land is swampy, but when drained, yields the finest potatoes and garden vegetables of every kind.

The coast line has been but very imperfectly examined. Some rocks, called the *Sisters*, or *Itutahi*, lie off the northern coast; and Bishop Selwyn mentions having met with numerous signs of shipwreck. His own little vessel, the *Undine*, anchored in an open roadstead, on the eastern coast, called *Waitangi*, and was preserved from being driven on shore by the surf and by the furious eddies of wind encircling the land, only by a floating breakwater of sea-weed. Much better and more sheltered anchorage is, however, to be found at the opposite extremity of the wide bay, bordered by a flat, sandy beach, which divides the red bluffs of *Waitangi*, on the south, from the harbour of *Whangaroa*, or *Waikanae*, on the north.

The geology and mineralogy of the island have not been described.

Specimens of peat, taken from a layer not in actual formation, but covered by a loamy earth, several feet in thickness, and which were evidently formerly pure peat, had a conchoidal fracture and lustrous appearance, greatly resembling coal, whilst in other parts of the same specimen, the gradual transition from true peat was evident. Dr. Dieffenbach says, that the peat which occupies large tracts in the countries without the tropics, lies generally in horizontal and equal layers, often contains trees imbedded in an upright position, and when artificially compressed, resembles coal far more than any lignite substance he had ever seen. In opposition, therefore, to the

generally-received theory concerning the origin of coal, he does not think it possible, by any agency, whether by the pressure of a superincumbent formation, or by igneous causes from below, or by both agencies combined, to convert a mixture of trees and earth, or mineral substance, into the regular stratifications of the homogenous article called coal.

SOIL AND CLIMATE.—The earth appears to consist chiefly of a rich vegetable mould, formed by the decay of vegetation, with a mixture of drifted sand. In its natural state it is generally swampy, but when drained and cultivated is very productive. The climate is stormy but salubrious: diseases are few, and not peculiar to the islands.

NATURAL PRODUCTIONS.—The vegetation is abundant, but the trees are of small size, and for some distance upwards the stems are devoid of branches. In many parts flax and fern predominate, and no timber is found. Wheat grows well, and is cultivated by the natives for exportation to New Zealand; their gardens also yield the finest potatoes and vegetables of every kind. There are no wild animals; the horse, ox, and pig have been introduced, and thriven well; their sleek skins shewing that hunger is to them unknown. Indeed, the signs of superabundant plenty are everywhere visible.

POPULATION.—The natives called *Parai-whara* have evidently migrated from some other of the Polynesian islands. Nothing was known respecting them or their territory, in New Zealand, until about the year 1838, when the first account of them was brought by a European ship, upon hearing which, a large body of Maories then living at Port Nicholson, being themselves in fear of Te Rauperaha, seized the English brig *Rodney*, and induced the captain to convey them to Chatham Island, where they soon overpowered the aborigines, killing some, and reducing the remnant to a state of slavery, as was usual in Maori warfare. When Dr. Dieffenbach, with Mr. Hanson, visited the island in 1841, he ascertained that the people consisted of two tribes, named the *Nati-motunga* and the *Nati-tomma*, who were at war with each other, when the latter made the former prisoners, by seizing them in their pah. The whole number of inhabitants in the islands does not, it is supposed, now exceed one thousand.

In 1848, Bishop Selwyn saw several

* Bishop Selwyn's Visitation Tour, in 1848; pp. 99-100.

members of the aboriginal race, whose number he ascertained to be 268, including men, women, and children. They are not very different in appearance from the New Zealanders (except in the absence of the tattooing), and their language, at the time of the invasion, was perfectly intelligible to the Ngatiawa tribe, who usurped their territory. The bishop describes them as "a cheerful, willing people, and like many persons in a subordinate station, more obliging than their masters."* When conquered they were in a very primitive condition, their chief food being eels caught in the numerous lakes, and other fish on the coasts: so ignorant were they of esculent roots, that when shewn potatoes, they impaled them like eels on skewers, and sat watching them before the fire, expecting to see oil ooze out in the cooking. Their canoes were ingeniously made of small sticks carefully tied together with flaxen cordage, there being no trees of sufficient size to hollow out for the purpose.

Soon after the reception of Christianity by the Maorics at Waikanac and Otaki, on the west coast of the Northern Island of New Zealand, the Rev. O. Hadfield sent native teachers over to the Chatham Islands, and the profession of Christianity spread rapidly. A German missionary establishment was subsequently formed at the eastern side of the island, on a wooded eminence, near a village named *Te Wakuru*. Bishop Selwyn,

in 1848, was "cordially welcomed by the five gentlemen and three ladies who form the little missionary body." He found them living in the simple and unpretending manner, best adapted to their holy and apostolic calling; they seemed to be as one family, and to have all things in common. The station shewed many signs of the useful industry which forms an essential part of the system of German missionaries; a good windmill was then nearly completed, and the native chapel was furnished with neat glass windows, obtained from the cabin of a shipwrecked vessel.

The bishop endeavoured to induce them to place themselves in connexion with the Church of England, as many Lutheran clergymen have done, but in this attempt he did not succeed;—he also found a decided disinclination existing on the part of the natives to join the German communion, and a strong feeling in favour of the Church of England. He mentions as an instance of the religious feeling of the natives, the fact of nearly 400 people having assembled on a Saturday at Taupeka, for the services of the following day, while at another place seventy children were presented to him by the native teachers, with the full consent of their parents, that they might be admitted by the sacrament of baptism within the pale of the church. Thus, in this small and remote group, the benefits of Christianity are becoming appreciated.

CHAPTER II.

ISLANDS IN THE WESTERN PACIFIC TO WHICH ENGLAND HAS A CLAIM, OR WHICH, UNCLAIMED BY OTHER NATIONS, LIE CONTIGUOUS TO BRITISH POSSESSIONS.

THE intertropical islands to the west and north-west of the island-continent of Australia, are probably destined, in coming years, to occupy as prominent a position in the commercial annals of the world, as the West India Islands, adjacent to the American continent, have done during the past century, and may, it is to be hoped, again attain.

The migrating route of the Anglo-Australian people lies along the eastern coast

from Moreton Bay towards Cape York; from thence the isles of Torres Straits form an oceanic bridge by which the neighbouring groups may with ease be reached; and thither a luxuriant clime, fertile soil, and beautiful scenery, will tempt many European adventurers to form establishments for the growth of the tropical productions required in the markets of the colder regions of Australia, Van Diemen's Island, and New Zealand. The enterprising and intelligent Chinese, who are sure to migrate wherever gold

* Visitation Tour, in 1848; p. 99.

or the hope of improved position may offer, will find their way there, as they have already done to California; and thus a population, comprising the three elements of capital, skill, and labour, will be created, adapted for the conversion of many of these rich but now almost waste lands, into scenes of active and profitable industry. The people now thinly scattered over these islands, appear to resemble strongly the aborigines of Australia, and are consequently decidedly inferior to the Maories of New Zealand; the few travellers who have had an opportunity of judging from personal experience, describe them as for the most part engaged in fierce and almost incessant hostility with each other, delighting in cannibalism, and all the worst vices and crimes of savages. On this dark and barbarous heathenism the light of Christianity is slowly dawning; missions are being planted, the native language reduced to a printed character, and the Gospel preached. This is as it should be; the conversion and at least partial education of the aborigines—be they few or many—ought always to prelude the colonization of their country; thus only can they learn to receive civilized men without being compelled to offer the opposition of enemies, or be reduced to the condition of slaves.

The rapid extinction of aboriginal races has become, in the mouths of many, a byword and a reproach to all colonizing nations, while others look upon it as an inevitable law that savage tribes should fade away and perish before the influence of a civilization for which neither they nor their children can ever become fitted. One thing, however, is certain—that England is bound by the faith she professes, and the first principles of the free constitution she so justly prizes, to remember that the “right of discovery” obtained as against other European nations, by the skill and daring of her navigators, if it have any validity, must necessarily involve a certain amount of responsibility, and that even in this case—much more in those where she is in the actual exercise of sovereignty—it is clearly her duty to make every effort for the preservation and progress of the races entrusted by the Ruler of Nations to her care and guidance. The present moment is an important one, rich in opportunities which wisely used, may be fraught with blessings, and avert great misery and bloodshed. Is it not of immediate importance that these islands, whither British adventurers at no distant period will surely

congregate, should be prepared for their reception?—that the natives should be guarded against the rapacity of the future settlers—the settlers protected from the ruthless barbarity of the natives?—that they be placed at least to some extent on a par with each other before a sweeping decree declares them fellow-subjects, yet yokes them in most unequal fellowship?

A wide field lies open, offering abundant scope for national and individual exertion: state policy and Christian duty dictate the same course, as, when rightly understood, they ever must do, pointing out the un-mixed good that would attend the conversion and civilization of these islanders. True, the task is no light one; yet, when we think of the great work that has been wrought in New Zealand, or looking towards Eastern Polynesia, behold in the Society Islands, Sandwich Islands, and other groups, the harvest of long years of toil, privation, and danger, being at length reaped, and a goodly fold gathered under the protection of the Shepherd of Souls, we may well believe that the Christian associations, who, under the various denominations of the *Church Missionary, Wesleyan, London, Baptist, Moravian*, and other missionary societies, have been the chosen instruments of effecting this great work, may be permitted to prosecute, with equal success, the labours now commenced in the islands whose leading characteristics, so far as they have yet been described, are briefly stated in the ensuing pages.

NEW CALEDONIA was first sighted by Captain Cook, on the 4th September, 1774, during the course of his second voyage round the world. He landed, examined several parts of the island, and caused an inscription to be cut on a large tree near the watering-place where his ship lay at anchor, setting forth the ship's name, the date of the visit, and other particulars, in testimony of the British discovery of the country, as he had done at all other places at which he had touched, “where this ceremony was necessary.”

The extreme length of the island is about 250 miles, the average breadth from twenty-five to thirty miles: it extends from 19° 37' to 22° 30' S. lat., and from 163° 37' to 167° 14' E. long. It is bordered by immense coral reefs, rising from the depths of the ocean, so like a perpendicular wall, that Captain Kent, commander of the *Buffalo*, sounding at no greater distance than twice the length

of his ship, with a line of 150 fathoms, could find no bottom. These reefs extend for perhaps thirty miles beyond the south point of New Caledonia, and in the opposite direction terminate in a circular form at double that distance from the land, thus constituting an embankment, against which the surging waves dash with extreme violence. Within the reefs the sea is always tranquil, and is studded with numerous lofty isles and islets.

PHYSICAL FEATURES.—The aspect of the island bears much resemblance to some parts of Australia, situated under the same parallels of latitude, in its barren and mountainous appearance, in many of its natural productions, in the coral reefs on its coast, and the absence of undergrowth in its woods. A lofty chain traverses it in a north-west to south-east direction, and lesser ridges rise on either side. Their elevation is described as varying from 2,000 to 6,000 feet; one eminence, however, is conjectured to attain a height of 8,000 feet.

A tract of flat land, intersected by winding streams, lies along the north-eastern shore, and the plantations, the little straggling villages, the variety in the woods, and the shoals on the coast, are described by Cook as affording an animated and pleasing scene. He likewise speaks of an extensive inland valley lying between two hilly ridges, through which ran a serpentine river, on whose banks were several native plantations and villages. The fertile spots on the plains, and some few on the sides of the mountains, were, however, only exceptional, the remainder appearing a dreary waste. The mountains and high places are, "for the most part, incapable of cultivation, consisting chiefly of rocks, many of which are full of mudicks. The little soil that is upon them is scorched and burnt up with the sun; it is, nevertheless, coated with coarse grass and other plants, and here and there trees and shrubs."* In fact, nature appears to have been less bountiful to this than to any other of the tropical islands in the Western Pacific.

The summits of some few hills are clothed with wood, as are most of the plains and valleys, which are irrigated by numerous streamlets. The available land is diligently cultivated by the natives. Near the village where Cook landed, and also in other localities, the ground was laid out in plantations of sugar-

* Cook's Second Voyage, p. 529.

canes, plantains, yams, and other roots: and watered by little rills conducted by art from the main stream, whose source was in the hills. He saw some roots baking on a fire in an earthen jar which would have held six or eight gallons, and which he did not doubt was their own manufacture. The loose black mould on the sides of the hills is sustained in its place by embankments of stone—as is done by the Chinese, and in some of the Malay islands. Of manuring the soil they have no idea, their only mode of recruiting its exhausted powers of production, being to allow it to remain fallow for some years.

POPULATION.—In appearance and language there is considerable dissimilarity between the aborigines of New Caledonia and those of the neighbouring groups: on the whole they resemble the Papuan negro rather than the Malay. They are of moderate height, well-proportioned, and of a swarthy colour inclining to brown. Their long, bushy, frizzled hair, of a jet black, is sometimes worn by the men tied in a bunch upon the crown of the head, and sometimes in two bunches, one on either side. Combs, composed of pieces of stick about the size of knitting-needles, are worn; they are generally about two inches long. The women all crop theirs closely, which gives them, in spite of their tortoise-shell ear-rings, a very unattractive appearance. The only covering worn by the men is a sort of apron, formed from the bark of a tree, fastened to a girdle which passes round the waist, or occasionally a large mat or wrapper; but the women wear a kind of short petticoat composed of the filaments of the plantain tree, and reaching below the knee. Their number was supposed by Mr. Forster, in 1774, to amount to about 50,000; this was probably an over estimate. The Rev. John Inglis, a reformed Presbyterian missionary, who visited the groups in the Western Pacific, towards the close of 1850, during a cruise of H.M.S. *Havannah*, (Captain Erskine), estimates the joint population of New Caledonia and the Loyalty Islands (a small neighbouring group) at only 40,000. Great destruction of life has taken place since the introduction of fire-arms, upon obtaining which the natives of the Isle of Pines went over, and nearly depopulated the south end of New Caledonia. Their native weapons consisted of stone axes with wooden handles, clubs, wooden spears or darts which they throw with

extraordinary dexterity, and smooth stones which they sling so skilfully as to strike down a staff at a considerable distance. The club has in many places been superseded by the tomahawk. They have no musical instruments, but are very fond of dancing, and strike sticks together as an accompaniment. The system of the *tapu* or *taboo*, formerly so general in New Zealand, is also practised here. The cocoa-nut trees are tapued, or made sacred, till all the other crops are planted, or till some feast is celebrated, and death is the penalty of touching the forbidden fruit. The *tattoo* is not among their customs. Circumcision is generally practised. Their houses are of a superior description to those found in the other islands of the Western Pacific, being constructed of a wattled frame, and thatched with grass; the walls are round, and the roofs conical; in appearance they resemble corn ricks; while in the neighbouring groups they have simply oblong sheds, some small, others very large. Their canoes are of considerable size, but clumsily formed, two single ones being usually fastened together with a kind of platform. Their character has been differently described. Cook bears honourable testimony to their good nature and honesty, they being "not in the least addicted to pilfering, which is more than can be said of any other nation in this sea;" he also commends the chastity of the women.

Admiral D'Entrecasteaux, who visited the island twenty years after, described them as strongly addicted to predatory habits; the statements of both navigators at the time they were given were doubtless correct, the temptation to thieving having increased with the successive visits of foreigners; the character of the women has deteriorated, doubtless from the same cause.

It remained, however, for more recent visitors to make known the most abhorrent feature in their character—cannibalism. It was long before the civilised portion of the world could believe that human nature, in its most savage state, its lowest abasement, could deliberately practise this loathsome and brutalising crime; but the testimony of many credible witnesses has placed beyond a reasonable doubt, that it has actually prevailed, more or less, throughout both

Eastern and Western Polynesia, but especially in the latter. The most recent authority (the Rev. John Inglis) says that "in open day, and as an ordinary practice, human bodies have been cooked and eaten by the score, and by the hundred." And he accords to the New Caledonians the fearful distinction of being, with the single exception of the natives of Fiji, "among the worst cannibals of Polynesia." In illustration of this he mentions that "at Shuaka, on the east of New Caledonia, one chief, in the space of thirty-five days, had caused as many as seventy people to be killed for the express purpose of being eaten. He always alleged some crime against them, but it was well known that the real object was to obtain their flesh to eat."* The natives, however, are everywhere beginning to feel ashamed of the practice; the influence of missionary operations, and the occasional visits of ships-of-war, are telling powerfully upon them, and by the blessing of God cannibalism will be soon entirely eradicated.

NATURAL PRODUCTIONS. — The inhabitants, partly from the nature of the soil, and partly from their imperfect, though careful mode of cultivation, were formerly but insufficiently supplied with the necessaries of life. The only native quadruped is the rat. Cook left with them a boar and a sow, and a male and female dog; but these were probably destroyed, as neither pigs nor dogs now exist on the island. The native vegetation comprises several kinds of timber, and some of the best known tropical productions, viz:—the bread-fruit, cocoa-nut, plantain, banana, and fig trees, sugar-canes, and yams; but most of these grow only in certain districts, and all, from the aridity of the soil, are of inferior quality. There are also three descriptions of the *arum*, or taro, and one of the sweet potato (*battata convolvulus*). The *arbor alba*, from whose odorous leaves the aromatic kaiaputa, or cajeput-oil, is extracted, likewise grows here. The soft, ragged bark of certain trees, and the tuberous roots of others, are sometimes used for food. The introduction of maize, pumpkins, melons, and other exotic productions, has now greatly ameliorated the physical condition of the natives, in respect to food.†

that the natives of the interior of the islands were driven to satisfy their hunger by eating a soft saponaceous crumbling stone, or steatite of a green colour, which, though it might appease the cravings of hunger, could not afford any real nourishment, and gave them an enfeebled and emaciated appearance.'

* Report to Governor Grey. Printed at Auckland, New Zealand, in 1850; p. 21.

† In one of a series of papers furnished me, when editing the *Colonial Magazine* in 1840, by Mr. Polack, the author of an interesting work on New Zealand, quoted in the preceding pages, it is stated

Fish of several descriptions abound; the method of capturing them employed by the natives, appears to be by lying on the coral reefs by which the shores are bordered, and striking them with their wooden spears, or catching them with small hand-nets and fish-gigs; but no mention is made of their using seines, or hooks and lines. Turtles are plentiful, as are also the famous bêche de mer, or sea-slug.

An exceedingly poisonous species of fish is found; it is described by Cook, who purchased one, among other kinds, from a native, as being "something like a sun fish, with a large, long, ugly head. No suspicion being entertained of its deleterious qualities, it was dressed for supper; Cook and the two Forsters alone partook of it, and they tasted only the liver and roe. About three o'clock in the morning they were seized with an extraordinary weakness and numbness in their limbs. Cook says he almost lost the sense of feeling, and could not distinguish between such light and heavy bodies as he had strength to move, a quart-pot full of water and a feather being the same in his hand. By emetics and sudorifics these distressing symptoms were removed: one of the pigs which had eaten the entrails died. These poisonous fish are probably similar to those found on the coral banks off Rodrigues Isle, near the Mauritius. Voyagers should be cautious in eating any species devoid of scales.

Land-birds are tolerably numerous; the species, however, are not very various, and resemble those found in New Zealand rather than New South Wales. In fact, the Flora of New Caledonia in general resembles that of the former, and the Fauna that of the latter locality. *Sea-fowl* of various kinds have been noticed. *Reptiles* there are none, except lizards. Mosquitoes and sand-flies are very troublesome. Locusts are much used as an article of food; and a peculiar description of spider is also occasionally eaten.

GEOLOGY.—According to Mr. Polack, quartz is very abundant, both opaque and transparent; mica; various steatites, more or less hard; green schorl; serpentinite; hornblende; and the talc, or poenamoo of New Zealand, are also found. Several irregular masses of rock have been noted, composed of remarkably close-grained stone, speckled with granites, each the size of a pin's head; garnets have been observed in petro-

silex.* No evidence of volcanic agency has been discovered. Specular iron ore and gold are said to exist.

The *climate* is not considered unhealthy; neither fever nor ague are known; hernia, hydrocele, and ulcerated noses and faces are, however, common: and Mr. Inglis states, that influenza, and other epidemics, occasionally prevail, and prove more or less fatal. Cases of elephantiasis have also been remarked.

Some of the smaller islands in the vicinity of New Caledonia are comparatively populous. A French Roman Catholic mission was established on the main island, a few years ago, but has recently been abandoned, and the missionaries are now located on the Isle of Pines, so named by Cook, from the fine trees growing there, which afford timber adapted for the masts and spars of ships. This little isle lies a short distance off *Queen Charlotte's Foreland*, the south-east extremity of New Caledonia, and is about a mile in circuit. Another still smaller isle was visited by Cook, and named *Botany Isle*, from the variety of tall trees, (some of which measured twenty inches diameter, and between sixty and seventy in length,) and of shrubs and plants growing on its sandy surface. Water-snakes, pigeons, and doves were also found here.

Balabea, and several other isles, together with numerous rocks and shoals, lie between the main island and the outer reefs; but of these no especial mention need be made.

NEW HEBRIDES.—The group bearing this name extends between $14^{\circ} 0'$ and $21^{\circ} 0'$ S. lat., and between $168^{\circ} 41'$ and $170^{\circ} 0'$ E. long. Quiros, in 1606, sighted these islands, and supposed them to be part of the immense *Terra Austral* of which mention has been so frequently made. Bougainville discovered that the land was unconnected, and composed of several islands which he called the Great Cyclades. Cook, in 1774, explored the whole archipelago, discovered many new islands, and gave them their present appellation. The following is a brief description of their leading features:—

The largest and most westerly, *Terra del Espiritu Santo*, is 66 miles long, from N.N.W. to S.S.E., and 36 miles broad. The northern coast is indented by a deep curve, comprising 20 leagues of sea-coast, called the *Bay of St. Philip and St. James*, which is everywhere free from danger, and of unfathomable depth, except near the shores, which are for the most part low. The two points forming the entrance are 10 leagues

* *Vide Colonial Magazine* for 1840, p. 411.

distant; the eastern is named *Cape Quiros*, the N.W. *Cape Cumberland*. The bay as well as the flat land at the head of it is bounded on each side by a ridge of hills; the western range is very high and double, traversing the whole length of the island, whose entire area, but especially the W. side, is exceedingly high and mountainous—in many places the hills rise directly from the sea. Besides the bay of St. Philip and St. James, other good bays and havens are doubtless formed by the isles which lie along the S. and E. coast. Except the cliffs and beaches, every other part of the surface is covered with wood, or laid out in plantations, from the number and extent of which the inhabitants would appear to be industrious and comparatively numerous. The chief feature in the luxuriant vegetation is formed by the fine cocoa-nut trees and graceful palms. Streams of fresh water flow through every little valley.

The next considerable island is *Malicola*, to the S.E. It extends N.W. and S.E. for above 50 miles, and has a varying breadth of from 8 to 24 miles, the middle being the narrowest part, a wide and tolerably deep bay on the S.W. side causing the diminution. The sea-coast is low, indented by creeks, and skirted by islets. A profuse tropical vegetation extends from the shore to the summits of the hills. *St. Bartholomew's Island*, which is about 20 miles in circuit, is situated at the N.E. point of the strait, named after Bougainville, that separates *Malicola* from *Espiritu Santo*. The centre of the passage is in 15° 45' S. lat., 168° 28' E. long.

The *Isle of Lepers*, of an egg-like shape, very high, and between 50 and 60 miles in circumference, lies between *Espiritu Santo*, and *Aurora Island*, a remarkably elevated and hilly tract everywhere covered with vegetation, intersected with streams, and well inhabited. It is 33 miles long, but rarely exceeds 6 or 7 in breadth. The plantations are filled with the finest fruit produced in the archipelago. *Whitsuntide Island* is one league and-a-half further to the S., it is of similar length, and lies in the same N. and S. direction, but is somewhat broader, and is clothed with wood except in the cultivated portions.

Two miles to the S. of *Whitsuntide* is *Ambryn*, an island of about 50 miles in circumference. The shores are low, but the land rises with an unequal ascent to a tolerably high mountain, which is an active volcano. It is fertile and populous.

Paoni is 15 miles in circumference; the land attains a great height in the form of a hummock; it is well peopled, and is divided in two by a canal. The neighbouring island of *Apee* is not less than 60 miles in circumference; it is very hilly, and diversified with woods and lawns. Off its southern extremity a small group extends, called *Shepherd's Isles*. *Three Hills Island*, about 15 miles in circumference, lies 4 leagues S. of *Apee*. *Sandwich Island* lies 9 miles to the S. of *Three Hills*, and is of much greater importance, being about 75 miles in circuit; its greatest extent in the direction of N.W. by W., and S.E. by E., is 30 miles.

Montagu Island is situated 6 miles north of *Sandwich Island*, and is 18 miles in circumference. The neighbouring isle, named *Two Hills*, from two remarkable and elevated mountains, separated by a straight and low isthmus, is only 2 miles in length; a channel, 3 miles long and 1 broad, intervenes between it and the *Monument*, a peaked black rock 200 feet high, nearly covered with bushes. *Hinchinbrook* is about 40 miles in circumference; two or

three small isles lie between it and *Sandwich Island*, with which heavy breakers evidence its connexion.

Erumanga, distant 18 leagues from *Sandwich*, is 70 or 75 miles in circumference; six leagues from its southern shore is *Tana*, an island 24 miles in length, with a breadth varying between 9 and 12 miles. On the north side of the eastern point of *Tana* is *Port Resolution*, so named by Cook in honour of the first ship that ever entered it. It is formed by a little creek running inland for $\frac{3}{4}$ of a mile, and about half as much broad. This harbour is particularly convenient for taking in wood and water, for both are close to the shore; the depth of water is from 6 to 8 fathoms, and the bottom sand and mud. About 4 miles from *Port Resolution* there is a large volcano, which was visited by the Rev. J. Inglis in 1851. Of seven or eight craters, some were then extinct, others smouldering, and two were in a state of great activity; every five minutes or so, the one or the other emitted a dense cloud of smoke, exploded with a sound like thunder, and discharged a shower of molten matter. The volcano is always active, though the eruptions vary greatly in violence and duration, the noise at times being heard only in its immediate vicinity, and at others being distinctly audible at *Anciteum*, a distance of 30 to 40 miles. The mountain is low, and an area of perhaps 3 miles in diameter is covered with ashes. It is close to the sea upon one side. For a considerable extent along the side of *Port Resolution*, next the volcano, a succession of hot springs bubble out from the rocks on a level with the tide-mark, of all temperatures, from the boiling point downwards. The water is fresh, has no peculiar taste, and is regularly used by the natives. In one or two places smoke issues from the ground, and the soil is burned and cracked.

The island of *Penticost*, discovered by Bougainville, is high, well cultivated, and covered with abundant vegetation; it is 23 miles long and 8 broad. The isle of *Inmer*, the most westerly of the Hebrides, is about 15 miles in circuit, of considerable height, and flat at the top. *Anciteum*, the southernmost island, has a hilly surface, and is between 11 and 12 leagues distant from *Port Resolution*. A sandalwood establishment has existed here for several years, and a Presbyterian mission, which will be subsequently mentioned, has been more recently formed. The population is estimated at about 3,000. The most northerly island discovered and named by Quiros, *Nuestra Señora de Luz*, was called *Pic de l'Etoile* by Bougainville, from the remarkable cone which rises in the interior. It is about 12 miles in circuit.

Geology, Soil, Climate, and Natural Productions.—The formation of many of the islands is evidently volcanic, but beyond this fact little is known; the soil when manured would probably richly repay its cultivator. The climate from November till April, during the N.W. monsoons, is decidedly unhealthy, the hot and humid atmosphere giving rise to fever, similar to the jungle fever of India, and severe ague. At this season, violent thunderstorms and fierce hurricanes are frequent, and heavy rains continue for weeks together. The winter is, however, said to be healthy and agreeable; and the natives are in general well-formed, vigorous and robust, with remarkably white and well-set teeth. The vegetation much resembles that of New Zealand in its close undergrowth, and variety of ferns. A

species of the kauri pine is likewise found. Among the various indigenous products, the most important are—the sandal-wood, of which considerable quantities are obtained from the various groups in the western Pacific for sale in the Chinese markets, bread-fruit, plantains, and cocoa-nuts, which, however, are neither very fine nor numerous, oranges, bananas, wild figs, nutmegs, nectarines, citrons, almonds, and the pepper plant; sugar-canes and yams flourish luxuriantly in several of the islands, the latter especially sometimes weighing between 50 and 60 pounds, and being of excellent quality. The taro and the sweet potato are also cultivated. To the above, various exotic products have since been added, such as maize, pumpkins, and the "papaya" apple. The only indigenous quadruped is the rat; pigs were, however, introduced previous to the explorations of Cook. Fowls (similar to the domestic fowl of Europe) afford an important article of food, and are common to all the islands, as are also wild ducks, teal, water-hens, pigeons, parrots, parroquets, swallows, and fly-catchers. Owls and large bats abound in the forests. The only reptile is the lizard, and a species of sea-snake. Fish does not abound, at least the natives do not appear to attach very great importance to it, and but few of them possess the necessary adjuncts for fishing even after their imperfect method. Various species have, however, been observed.

Population.—The New Hebrides group is estimated to contain at present about 40,000 inhabitants, between whom many striking points of difference exist, both in their persons and language. They have all curly black hair, and are darker than the New Zealanders, but not nearly so black as the Africans. In stature they vary, being in some of the islands above, and in others below the average size. The people of Malicola are described by Cook as particularly ill-favoured and unprepossessing. Their clothing is much the same throughout, the men wearing a narrow cincture, and a wrapper of leaves or native cloth; the women a mat manufactured from the bark of a tree, adding, in some instances, a cordal appendage, which, seen from a distance, might easily be mistaken for a tail. The men of Aneiteum and Yana dress their hair after a peculiar fashion, dividing it into small locks, and twisting it round the rind of a slender plant, thus giving it the appearance of a bunch of small whipcord.

According to the reports of the missionaries recently stationed in this archipelago, the natives are occupied in fighting for ten months in the year; but there is comparatively little loss of life, as if one man is killed on either side the battle terminates for the day. Their chief missiles are wooden spears, which they use with marvellous dexterity. At Malicola dancing is a very popular amusement, and for two months in the year the natives meet daily at midnight for that purpose; here also every family or few families have a cluster of 10 to 20 drums, made from trees hollowed out like a canoe, and fixed into the ground, rising about 6 feet high. The opening on the side of the tree is as narrow as it can be made to allow the wood to be scooped out of the centre. When struck they emit a hollow funereal sound, and are employed to furnish music at their dances, and on other occasions. In some of the islands the natives are said to sing very sweetly. Their traditions and superstitions are many of them similar to those extant in the Eastern Pacific, and it is easy to trace in them their reference to several of the great

facts of universal history; for instance, they assert that the island was fished up by one of the gods, who afterwards made a man and a woman, from whom they had descended; and a native of Aneiteum, while one day listening to an oral translation of the Scriptural narrative of the flood, made by a missionary, cried out, "Stop! that is almost the same as ours, but your fathers having written an account for you, while ours only told it to their children, yours must be the more correct." Polygamy prevails to some extent, especially among the chiefs. The wife is strangled upon the death of her husband, or even when he is long absent from home; and all the children not able to support themselves share the same fate. The *tapu* is employed in all the islands to preserve persons and objects. The plantations are cleared, fenced, and cultivated with great care; irrigation is extensively practised, and canals more than a mile long are observable along the sides of the hills. Their knowledge of navigation is very imperfect; their canoes are inferior to those of New Caledonia and other groups, and at the time of Cook they were all ignorant of the extent of the archipelago they inhabited. Tobacco is fast coming into general use, but the taste for alcoholic liquors has not yet been acquired.

Missionary Operations.—A deputation from the London Missionary Society visited the New Hebrides in 1839, when the Rev. J. Williams and Mr. Harris were unhappily killed by the natives of Erumanga. Native teachers were subsequently planted on Aneiteum, Tana, and other islands; but a great number of them have perished, either from the climate, or by the hands of the barbarous natives. In 1842, two of the London Society's missionaries were located, with their families, on Tana, for ten months, when influenza, or some epidemic appearing, the natives attributed the calamity to their influence, and compelled them to quit, since which time no European missionary has been stationed there.

In 1848, a Presbyterian Mission was established at Aneiteum, the progress of which has been extremely encouraging, and life and property are perfectly secure throughout the island. A French Roman Catholic Mission was established there in 1848-'49; but the missionaries have since been wholly withdrawn from the New Hebrides. The small tribes, diversified languages, and little communication existing between the different islanders, are doubtless obstacles in the great and holy task of converting and civilizing them. The climate, again, is a terrible difficulty. Encouragements to persevere are, however, not wanting, in the naturally mild disposition of the people, when their passions are not excited: their energy and perseverance, also (a most unusual feature in the character of savages); their aptitude for acquiring the English language; their present strong desire for English missionaries to live among them; and their confidence in the British character.*

QUEEN CHARLOTTE'S ISLANDS, a small group to the northward of the New Hebrides, were so called by Carteret, who visited them in 1767; the principal island, which is about 24 miles in length and 10 in breadth, he named *Egmont*; it had, however, pre-

* *Vide* Report of the Rev. John Inglis; 1851: p. 30.

viously been discovered by the Spanish navigator Mendana, who had given it the appellation of *Vera Cruz*, which it still retains. To one of the smaller isles, *Vanicolo*, a melancholy interest attaches, as the spot where the celebrated La Perouse, and his companion, M. de l'Anglo, perished; their vessels, the *Astrolabe* and *Boussole*, having been wrecked on a coral reef. In their general character and productions, Queen Charlotte's Islands, bear a considerable resemblance to New Zealand. The population is probably a few thousands.

THE SOLOMON ISLANDS, are eighteen in number, and extend between 5° and 10° S. lat., and 155° and 160° E. long. They also were first visited by Mendana, in 1567, and were so far forgotten in the lapse of years, that their very existence was doubted by geographers until their rediscovery by Carteret. The names and positions of the principal of them will be seen by a reference to the general map of the Polynesian Islands. The number of the people is unknown, but it is thought to be considerable; cannibalism is a fearfully prominent feature in their character. They tattoo their bodies, wear rings in their ears and noses, and appear to live in a state of continual warfare. Their canoes are skillfully constructed and ornamented with mother-of-pearl.

The islands situated to the north-east of the Solomon group, namely, New Britain, New Ireland, New Hanover, the Admiralty, and others of smaller dimensions, were long considered by the Dutch, Portuguese, and Spanish navigators, to be part of New Guinea. Dampier proved their insularity at the beginning of the eighteenth century.

NEW BRITAIN extends about 280 miles from E.N.E. to W.S.W. with a very variable breadth, owing to the numerous indentations of the coast-line, in some places being not eight, and in others nearly thirty miles broad. A chain of mountains occupies a large portion of its area.

Dampier, D'Urville, and the unfortunate D'Entrecasteaux, (who perished of scurvy off this coast), agree in describing New Britain as a country gifted with great natural advantages. The coast is easily accessible on every shore; the land in most parts rises with a gentle ascent, is covered with a beautiful and varied vegetation, and irrigated by numerous streams. The mountains are wooded to their summits. Plantains, cocoa-nuts, cabbage-palms, and areca-nuts; wild spices, including ginger, tur-

meric, pepper, and nutmegs; yams and various other vegetables are indigenous. Among the birds, parrots, paroquets, and a species of cockatoo are very numerous.

The bays and creeks abound with fish. The geology and mineralogy of the island have not been examined. The climate is salubrious. The aborigines are dark-coloured, with frizzled hair and large lips; their bodies are painted and oiled, and the nose and lobes of the ears perforated, and adorned with various articles, such as the teeth of men; dogs, sharks, &c.

NEW IRELAND has a length of nearly 200 miles, from north-east to south-west, with a breadth varying from eight to twenty miles. A chain of mountains, like those of the contiguous groups, runs through the centre. The scenery, soil, and climate much resemble those of New Britain.

NEW HANOVER, so named by Carteret, in 1767, is about twenty-eight miles long, and twelve broad; mountainous, and well wooded. A strait, from five to six miles wide, separates it from New Ireland.

THE ADMIRALTY ISLANDS extend 120 miles from east to west, and fifty from north to south. They are about twenty-five in number, and are mostly high. The largest, named *Basco*, is fifty miles from east to west, with a breadth of eighteen to twenty miles: it is mountainous, and well wooded. *Jesus Maria* has a circuit of twenty; others have diameters of four or five miles; and several are quite small. The general aspect is very pleasing. The aborigines are similar to those of the before-mentioned groups, and their savage nature contrasts strangely with the beautiful and peaceful scenery around.

There are various other isles in this vicinity, but space only permits a brief notice of the extensive and valuable island, separated by Torres Strait from the northern coast of Australia.

NEW GUINEA, OR PAPUA, extends in a south-east direction from the equator to the parallel of 10° S., and between 130° and 150° E. long. The irregularity of its form renders it difficult to form any estimate of its area. In one place, a narrow isthmus connects the eastern with the western portion of the island. The interior is mountainous, and the scenery extremely picturesque: large lakes, numerous rivers, grassy lowlands, and lofty forests, constitute the principal features. The inhabitants are reported to be very barbarous, and fearfully addicted to cannibalism.

BRITISH POSSESSIONS IN AFRICA.

BOOK I.—CAPE OF GOOD HOPE.

CHAPTER I.

INTRODUCTION—POSITION—DISCOVERY—HISTORY.

THE peninsular-continent of Africa, one of the great divisions of the globe, and the next to Asia in point of size, extends in a triangular form between 37° N. and 34° S. lat., a distance of nearly seventy-two degrees, or about 5,000 English miles; and from 18° W. to 51° E. long., the extreme breadth being thus nearly equal to the length. It is united by the narrow isthmus of Suez to Asia, and is bounded on the north by the Mediterranean, for a distance of 2,000 miles; on the north-east by the Red Sea and Gulf of Bab-el-Mandeb, for about 1,500 miles; on the east by the Indian Ocean for 4,000 miles, and on the west by the Atlantic Ocean for nearly 6,000 miles, thus showing a sea coast-line of some 13,500 miles without calculating the minor bights, bays, and inlets. In breadth this extensive region is very unequal; it is greatest between Cape Guardafui, near the entrance of the Red Sea, on the east, and the British settlement of the Gambia on the west; thence contracting abruptly towards the equator, the latter coast forms the deep, wide bight called the Gulf of Guinea; and a succession of curves on either shore mark the gradually diminishing area of the land until its termination at the southern extremity (the apex of an irregular triangle) known as the Cape of Good Hope. The superficies of Africa has been variously estimated: Malte Brun makes it 13,430,000 British square miles; Ukert 11,961,675, including Madagascar and the adjacent islands; and Gräberg's calculation approaches closely that of Ukert.

Although nearly insulated, and penetrable in various directions to a considerable extent by means of the Nile, Niger, Senegal, Gambia, Congo, Quilimane, and other rivers, yet, owing to the almost insuperable obsta-

cles interposed by its mountain chains and sandy deserts; by extremes of temperature, scanty supplies of water, and, in several localities, noxious climate; so little is known of the interior, that modern map makers and hydrographers might still resort to the old plan of delineating "elephants to fill up gaps," or the less excusable expedient of introducing supposititious mountains of extraordinary height, and rivers with imaginary courses. Even the European settlements of the French on the north and north-west; of the Portuguese on the east, and of the British on the west, south, and south-east (except at the Gambia and at the Cape of Good Hope) have been chiefly confined to the coast-line.

To what extent the ancients were acquainted with the shores of Africa we have but insufficient means of judging; the borders of the Mediterranean, where Carthage, the rival of imperial Rome, stood, were doubtless well known to them; Egypt and the Abyssinian coast are renowned in Pagan, Israelitish, and Christian records; and it is conjectured that Sofala, on the western shore of the Mozambique channel, was the Ophir whence the Queen of Sheba brought presents to Solomon. On the western coast, their knowledge is not supposed to have extended farther south than Cape Blanco or Cape Verd. In a later age (from the tenth to the fourteenth century) the Arabians penetrated a considerable distance into the interior of Africa, and formed several extensive settlements, especially on the western coast, but had evidently no knowledge of the Cape of Good Hope, as Edrisi, the famous Arabian geographer, extends Africa to the eastward until it becomes conterminous with India and China. From the fifteenth century, the

honours of geographical discovery belong to Europeans. In the first rank stands the name of Prince Henry, Duke of Visco, (surnamed the Navigator,) son of John, first king of Portugal, and Phillippa of Lancaster, sister of Henry the Fourth of England. This prince is said to have received much information at Ceuta respecting the territories to the southward of Morocco, while engaged with his warlike father in an expedition against the Moors, and his energies were directed to the circumnavigation of Africa with a view to opening a maritime route to the rich regions of the east, whose valuable commerce was then monopolized by the republics of Venice and Genoa, which was carried on by the overland route through Asia-Minor,—by the Red Sea, or the Euphrates and the Persian Gulf.

Although more than a century had elapsed since the introduction of the compass into Europe, mariners were afraid to venture far out of sight of land, and regarded the untraversed expanse of the broad Atlantic with awe; moreover an old belief still held its ground, that the earth was girdled at the equator by a torrid zone or region of intolerable heat, which separated the two hemispheres, and a superstitious opinion existed that whoever passed the surge-bound shores of Cape Bojador (in the neighbourhood of the Canary Islands) was fated never to return. These and other prejudices were vigorously combated by Henry the Navigator. He did not live to witness the full realization of his brilliant anticipations, but they were ably carried out in the reigns of his nephew John II., and his successor Emanuel II., by Bartholomew Diaz, Vasco de Gama, Columbus, and Magelhaens.

The doubling of the dreaded cape by Gilianez caused great surprise, and strongly stimulated the growing spirit of enterprise which at this period many circumstances combined to cherish in the Portuguese nation. Religious zeal, and an ardent desire to spread the faith of the cross, was a leading object, though the missionary efforts of the age were unhappily so deeply tinged with that most dangerous error of the Roman catholic doctrine, that the end sanctifies the means, as to be productive of much misery. It seems scarcely possible that a nation earnestly engaged in the holy work of evangelizing a people should commit so fearful a breach of the Gospel they professedly came to teach, as to take forcible possession of a territory, and sell its unof-

fending inhabitants, or at least suffer them to be sold, and carried away into slavery. Yet so it was—the King of Portugal on the discovery of the Gold Coast, took the title of “Lord of Guinea,” in virtue of a grant made to him by the arrogant Roman pontiff of all lands lying to the southward of Cape Bojador, formed an establishment called Elmina (the mine), which he made the capital of his African possessions, and commenced a traffic in *slaves* and gold dust. In 1484, Diego Cam sailed from Elmina to the southward, safely passed the tropics, thus divesting the torrid zone of its imaginary terrors, and discovered the mouth of the river Zaire or Congo, on whose southern bank he erected the emblem of Portuguese dominion—a lofty stone pillar, surmounted by a crucifix inlaid with lead, with an inscription on the stone showing the arms of Portugal, and the date of the discovery.

The natives received the strangers in the most friendly and fearless manner. When questioned by signs respecting the residence of their chief or king, they replied that he dwelt a long distance in the interior, and undertook to lead a party of the Europeans to him, and bring them back safely within a stipulated period. Having made this arrangement, Diego, taking advantage of a moment when several of the principal persons were on board his ship, weighed anchor and set sail, soothing their alarm by assuring them that in fifteen moons they should be restored to their country. On reaching Lisbon he presented “these nobles,” as they were then called, to the king, who loaded them with presents, and enabled Diego to keep his promise of returning immediately with them to the Congo, where, on arriving, he found the part of his crew whom he had left behind, alive and unhurt. The African monarch, on hearing the honourable treatment his people had received, treated Diego with great cordiality, and sent back with him several of the highest chiefs to be instructed in the principles of the Romish creed, which was accordingly done, and the Africans, after residing two years at Lisbon, were baptized; Henry II., himself, being godfather to the principal envoy, and his chief nobles to the others. They were then conveyed back to their native country with all honour, where the Portuguese were, in their turn, welcomed with joyful acclamation. The king and his chiefs were baptized, free scope was given to the exertions

of the missionaries, and a large number of the people, dazzled and amused by the splendid pageantry of the Papal ceremonials, and gratified by the presentation of beads, Agni Dei, images of the Madonna and saints, became nominal Christians long before they could have attained any sufficient knowledge of the pure and self-denying doctrines to which they were subscribing. All went on with apparent success until the missionaries, probably in too hasty and peremptory a manner, called upon their converts to renounce polygamy, by immediately selecting one wife, and dismissing all the others. Upon this the aged monarch abjured his Christian profession, and relapsed into paganism; but Alphonso, his son, the heir-apparent to the sovereignty, remained faithful, and on his accession to the throne the mission was again quietly established, and being reinforced by successive bodies of priests, spread extensively over the neighbouring country. The missionaries would doubtless have obtained much greater and more permanent hold over both the minds and the affections of the people, had they reasoned temperately and patiently with them on the vanity of their idolatrous and unchristian practices, instead of stealing secretly into their temples and setting them on fire, destroying their idols, and even personally ill-treating refractory individuals.* But the crowning blow to their influence was the establishment, among other ecclesiastical arrangements, of the Inquisition; this caused a sudden revulsion against them, and they thenceforth maintained only a precarious and even dangerous position. When and how they finally quitted, or were expelled, is not known, but the explorations of the present century prove that no trace or recollection of them now exists in this vicinity.

The discovery of the Congo River was speedily followed by others of greater importance. In 1486 Bartholomew Diaz was dispatched by the King of Portugal, in command of two small vessels, to find a way to India round the south-eastern extremity of Africa, according to a map given to Prince Henry by the Moors. Diaz was

likewise specially desired, as were all the officers employed on the African service, whether by sea or land, to neglect no opportunity of making inquiry of the natives, wheresoever they might be met with, respecting a Christian nation or collection of tribes, supposed to be governed by a Nestorian bishop, then much talked of throughout Christendom, under the singular name of Prester John. His dominions were supposed to stretch from Abyssinia far inland, and as the breadth of Africa was very imperfectly conjectured, it was thought probable that a mission from the east coast might be able to reach the court of the illustrious personage concerning whom so much mysterious interest had been excited by travellers from eastern Asia, and likewise by the statements made by some of the African kings or chiefs, respecting a potentate to whom, on their accession, they paid homage, who was neither heathen nor idolator, but professed a religion apparently similar to that of the Christians. The curiosity thus raised received no gratification from the expedition of Diaz, though his earnest zeal was crowned with a geographical discovery of the first importance to his country. He doubled the Cape of Good Hope, without being aware of its actual position, made the western point of Mossel Bay (named by him Cabo Vaccas, from the number of cattle which he saw grazing there), and on Thursday the 14th of September, 1486, (the Romish anniversary of the Holy Cross,) he anchored in Algoa Bay. Here the spirit of his mariners began to droop, and they firmly, though respectfully, urged upon their adventurous leader the necessity of returning to seek after the provision tender, from which they had parted.

Diaz had no authority to compel them to proceed in defiance of obstacles so grave as those which impeded his further progress; it was, besides, evident from the continued trending of the land to the north-eastward, that some great cape had been passed. He therefore landed on a rocky island in the bay, (Santa Cruz) accompanied by his chief officers and several sea-

* In a work entitled *Discovery and Adventure in Africa*, published in 1837, an amusing anecdote is related respecting the mode adopted by the Roman Catholic priests to enforce conviction upon a refractory subject. "A missionary at Maopango, having met one of the queens, and finding her mind inaccessible to all his instructions, determined to use sharper remedies, and seizing a whip, began to apply it to her majesty's person. The effect he describes

as most auspicious; every successive blow opened her eyes more and more to the truth, and she at length declared herself wholly unable to resist such affecting arguments in favour of the catholic doctrine. It was found, however, that she had hastened to the king, with loud complaints respecting this mode of spiritual illumination, and the missionaries thenceforth lost all favour, both with that prince and the ladies of his court."—P. 60.

men, and having taken possession of it in the name of his sovereign, planted there the usual stone pillar and cross, and partook of the sacrament with his companions, whom he then desired to state on oath, what they believed to be his and their duty to their monarch in this emergency. With one accord, they repeated their former declaration; he then conjured them to continue their attempt by sailing only two or three days more, pledging himself that if no important discovery should be made, he would no longer delay complying with their solicitations. During the time specified, they reached and entered the mouth of a stream named by them Rio d'Infante, but now known as the Great Fish River, and failing to procure any information from the aborigines respecting the position of India, they returned to Santa Cruz, doubled the great cape called by Diaz, Cabo de los Tormentos (Cape of Storms), from the heavy gales he there encountered. This appellation was changed by his royal master, John II., to the more auspicious title of Boa Esperanza (Good Hope),* from the prospect it offered of finding the much desired maritime route to the East Indies, which was eventually laid open by Vasco de Gama in 1497. In 1510, Francisco de Almeida, first viceroy of the newly acquired Portuguese dominions in India, returning thence with a fleet to Portugal, cast anchor at the Cape, and sent a party on shore to traffic for cattle; but this the natives refused, and compelled them to return to their ships. The viceroy was with difficulty persuaded to make another attempt to obtain refreshments, by landing in person, accompanied by a considerable body of officers and men; on entering the long-boat he exclaimed, alluding to his advanced age, with a melancholy presentiment of the issue of the adventure, "Ah, whither do you carry seventy years?" On landing, a trifling dispute between a sailor and a Hottentot, respecting a pair of brass buckles, is said to have been the immediate occasion of the contest which ensued; but it is far more probable that it was caused by an attempt to seize by force the cattle, which the natives refused to sell. The result was, that seventy-five Europeans, including the Viceroy, were laid dead on the shore, and the survivors fled in hasty confusion to their ships.

* Diaz was drowned off the Cape of Good Hope, eleven years after its discovery.

The revenge taken by the defeated foe was cruel and cowardly in the extreme. Two or three years after, a fleet bound for India again touched at the Cape, and the Portuguese, aware of the value placed by the aborigines on "glittering copper," landed a brass cannon heavily loaded, and telling the aborigines they had brought it as a present to their chief, directed them to drag it away by means of the long ropes attached to the mouth. The unsuspecting natives joyfully complied, and great numbers of them extended themselves in two files all the length of the ropes, full in the range of the shot; a torch being applied to the powder, a fearful slaughter ensued; those who escaped fled to the mountains in the wildest consternation, while their treacherous enemies re-embarked at leisure.

During the middle of the sixteenth century, the fleets of Portugal occasionally resorted to the Cape and the neighbouring bays, for the purpose of obtaining refreshments; but in 1581 the Portuguese fell under the cruel and degrading yoke of Philip II. of Spain (the husband of Mary, Queen of England), and the spirit of maritime adventure, which had so markedly characterized them, did not long survive their independence. The monopoly of the eastern seas and the chief part of their colonial empire were gradually wrested from them by the Dutch; whose naval supremacy was in turn contested by the English, who, in 1614, impressed with the importance of the Cape of Good Hope as a political position, attempted to establish a small convict settlement on Robben Island, Table Bay; but failed in consequence of an affray with the natives, in which some of the Europeans were killed, and the remainder compelled to quit. In 1620 Shilling and Fitz-Herbert, the commanders of two ships, belonging to the English East India Company, finding a Dutch fleet in Table Bay, and hearing that they intended forming a settlement there, thought to anticipate them by taking formal possession in the name of their sovereign, James I., and were suffered to do so without molestation by the Dutch officers; but no step in confirmation of this procedure appears to have been taken by the home authorities. At this time English, Dutch, and Portuguese vessels were in the habit of touching at the Cape on their outward and home-bound voyages, to procure refreshments, bury letters beneath large stones, and obtain those left for them in a

similar manner by the ships of their respective nations.*

The wreck of the *Haarlem*, a vessel belonging to the Dutch East India Company, in 1648, was the circumstance which more immediately led to the formation of a settlement. Two of the voyagers, named Leendert Janz and N. Proot, after residing there for some months, while waiting for a passage in the next home-bound-fleet, addressed an able and energetic memorial to the directors, setting forth the numerous advantages which would accrue to the company from the formation of a fort and garden at the Cape; showing that their ships and seamen would thus be enabled to procure better refreshment than St. Helena could afford, not only from the great capability of the soil and climate for the cultivation of various kinds of fruit and vegetables, but also on account of the abundance of sheep and cattle possessed by the "savages" who dwelt in the land, whom they described as kindly, hospitable, and confiding, and with whom they had been trading daily in perfect amity. The memorialists state that it was indeed true that some soldiers and sailors had been beaten to death, but they add; for this "we have not the natives, but the rude unthankfulness of our own people, to blame; for last year, when the fleet under the command of Wollbrandt Gelcijnssen, lay at the Cape, instead of making to the natives any recompense for their good treatment of those of the *Haarlem*, they shot seven or eight of their cattle, and took them away without payment, which may likely cost some of our people their lives if opportunity offers, and whether they have not cause, your honours will be pleased to consider." Among the inducements urged by Janz and Proot in favour of their project, was, that by maintaining a kindly intercourse with the natives, who had already given evidence of their ability to acquire a knowledge of the Dutch language, many souls would be brought to God and to the Christian religion, so that the formation of the said fort and garden would "not only

tend to the gain and profit of the honourable company, but to the preservation and saving of many men's lives, and, what is more, to the magnifying of God's holy name, and to the propagation of his gospel, whereby, beyond all doubt, your honours' trade over all India will be more and more blessed."†

The above representations probably decided the directors in at once attempting to establish themselves at the Cape. The formation of the proposed residency was entrusted to Jan van Riebeeck, a member of the return fleet whose ungrateful conduct was so indignantly reprobated by Janz and Proot. In a letter written by Van Riebeeck to the directors, or Chamber of the Seventeen, as they are more frequently termed, bearing date June, 1651, he expresses his gratification at having been admitted into their "praiseworthy service at his humble request," and confirms the statements of the memorialists in all points except with regard to the natives, whom he describes with evident prejudice as a savage set, by no means to be trusted; but he does not attempt to refute the direct accusation made against the Dutch by their own countrymen for "rude unthankfulness" and dishonesty.‡ This communication, as well as many subsequent ones, are by no means calculated to convey so favourable an idea either of the principles or abilities of the writer as that generally entertained; to obtain "further promotion from his honourable masters in fatherland," was his ruling motive, the welfare of the colonists being a very secondary consideration; while, with regard to the natives, the occupation without payment of as much of the best land as could be appropriated without provoking actual hostilities, and the obtainment, by the temptation of spirituous liquors and tobacco, of their flocks and herds, in exchange for brass and beads, was, from first to last, Van Riebeeck's policy, to which he steadfastly adhered; still, by manœuvring in some shape or other, compelling or inducing the aborigines to dispose of what was to them the main stay of life for the veriest trifles, even at the

* One of these missives, bearing date 1622, deposited in that year by Richard Blyth, commander of an English vessel bound from Surat for London, was recently found on removing the earth to repair a drain in one of the principal streets of Cape Town.

† *The Record*, a series of official papers (chiefly Dutch) showing the condition and treatment of the native tribes in South Africa, from 1649 to 1809. This valuable compilation, translated and edited at Cape Town, in 1838, by Lieutenant Moodie, R.N.,

mainly at the expense of the local government, forms a quarto volume of 570 closely printed pages.

‡ This accusation was doubtless well founded, for Van Riebeeck himself, in a subsequent communication, when endeavouring to obtain the consent of the directors to an act of most flagrant treachery acknowledges that "it has also often happened, before your honours had any establishment or fortification here, that their cattle have been taken or shot by your servants.—*The Record*, p. 50."

time when their wives and little ones lacked food.

At the close of the year 1651, two ships and a yacht sailed from Holland to take possession of the Cape, and arrived, after a voyage of four months and-a-half, without having touched anywhere for refreshment; the yacht *Goede Hoop* took the lead, and anchored in Table Bay after sunset on the 5th of April, 1652. Neither the names nor condition of the people destined to form the residency are mentioned in the early records, but it is stated in the directions given to Van Riebeeck by the assembly, that, as all the people were to be accommodated within the fort, proper lodging must be arranged for seventy or eighty persons. Among these, we learn from later despatches, were included some soldiers, several convicts, and probably a few slaves; the remainder were chiefly a low class of peasants; but there appears to have been also a small number of a higher order, from whom were selected a council, to which, with Van Riebeeck, the affairs of the residency were entrusted.

The families and the baggage were landed on the 24th of April, and lodged in a loose plank shed, hastily put together, and the erection of the fort, on the Soete (salt) River, was proceeded with as rapidly as the debilitated state of the people would permit. This was the humble commencement of the flourishing city of Cape Town, with its handsome buildings, fine streets, and luxuriant gardens. The country was inhabited by various nomadic tribes, who subsisted partly on the produce of their sheep and cattle, and partly on the flesh of the harts, steen-bucks, and other wild animals who ranged over mountain and valley in countless herds. At this early period, lions, leopards, wolves, and howling hyenas prowled about the "camp" at night; the rhinoceros was frequently seen within a short distance of it, and troops of elephants fed in the neighbouring thickets. A friendly intercourse speedily commenced between the Dutch and the Hottentots (or Ottentoots, as they were then termed);* one tribe especially, from the neighbourhood of Saldanha

Bay, are most favourably mentioned (8th April, 1652) in the journal kept by Van Riebeeck (and also by his successors in accordance with the special injunction of the Assembly of the Seventeen), as "very handsome, active men, of particularly good stature, dressed however in a cow (or ox) hide, tolerably prepared, which they carried gracefully upon one arm, with an air as courageous as any bravo in Holland can carry his cloak on arm or shoulder." They were armed with assagays (wooden spears, headed with iron), bows, and arrows. Nine of them meeting a much smaller party of the Dutch, who had gone out to fish in the Salt River, behaved "in a very amiable and handsome manner, so as to excite wonder—clasping the captain around the neck with great joy," and intimating their readiness to barter cattle for brass and tobacco. Accordingly, a few days later, Van Riebeeck obtained a cow and young calf for four pieces of flat copper, and three pieces of copper wire, each three feet in length.

Considerable difficulty was however subsequently found in obtaining animal food, the natives in the immediate vicinity of the Cape being very poor, and living chiefly on muscels and wild plants, and the more wealthy tribes having removed inland with their cattle and families, according to their custom in the winter season.

Perhaps a traffic between the Dutch and Africans would more readily have sprung up but for the interdict laid by the first proclamation of the commander (Van Riebeeck) and council, which forbade private trading under penalty of confiscation of the cattle or other articles so purchased, and the deportation of the offenders to Holland without pay or employment. The colonists had no horses, and were not sufficiently fleet of foot to hunt the wild animals, who wandered at will, within a cannon's shot of the fort,† and the great desire for fresh meat may be understood from an entry dated 24th April, 1652, which states that "the people on shore having caught a great sea-cow (hippopotamus), fully as heavy as two ordinary fat oxen, with a very frightful

against the teeth or palate. Kolben affirms it to be their national appellation. Kay and others declare their generic name to have been Quaiquæ.

† Van Riebeeck describes himself as exploring in a morning's journey from the fort, "the finest pastures in the world, full of game, harts, hinds, roes, elands, mountain ducks, geese, partridges, pheasants, &c., but all so wild, that it was impossible to catch them."—*Record*, p. 34.

* The origin of the word Ottentoot, which afterwards merged into Hottentot, after much discussion still remains an unsettled question. Some writers assert that it was a nick-name given by the Dutch, in consequence of the peculiar idiom of the language of this people, and its numerous monosyllables, especially *hot* and *tot*, uttered with strong aspirations from the chest, and a peculiar and frequently repeated guttural click or cluck, caused by pressing the tongue

monstrous head," used it for food. Fish of good quality was happily obtained in abundance; cormorants and penguins, and their eggs, were procured at Robben Island, and vegetables grew well from the imported seed. In the month of May a reinforcement of fifty men arrived from Holland. The inclemency of the weather materially aggravated the sufferings occasioned by insufficient nourishment, and imperfectly constructed dwellings. Dysentery and severe fever carried off many of these unfortunates, others lay prostrate, and in June, out of 116, only fifty were at all able to continue the laborious work of building the fort and digging the ground. Under these circumstances, it is not to be wondered at that they should make attempts at desertion. The runaway convicts from Sydney Cove, New South Wales, hoped in time to reach India or China, and five Dutch fugitives thought to get by land to Mozambique, and from thence make their way to Holland. One of them, named Jan Blank, had dreamed of finding a mountain of gold, and the others were possessed with equally idle delusions. Worn out with hunger and fatigue, they returned, after a week's absence, to the fort, and begged for mercy. The luckless dreamer was flogged and keelhauled, and sentenced, with his companions, to work two years in irons as slaves.*

The then imperfect knowledge of navigation, and the exaggerated ideas entertained respecting the dangers of the Cape of Storms,† rendered communication with the parent country very unfrequent and uncertain, thus greatly increasing the difficulties and depression of the little settlement. For instance, tidings of the war which broke out between the English and Dutch soon after the passing of the Navigation Act by Cromwell and his parliament, in 1651, did not arrive until January, 1653; and a galiot, the *Roode Vos*, which left the Texel on the 18th of September, 1652, only reached Table Bay on the 2nd of June, 1653, the captain and chief-mate having died on the passage, and the inferior officers and crew

having wandered about the Cape for three months, "in consequence of being misled by the compass."‡

Notwithstanding so many discouragements, the small band of Dutch settlers at this early period, before the introduction of slavery and its concomitant evils, and while still too weak to carry on warfare against the Hottentots, proved themselves gifted in no mean degree with the characteristic endurance and perseverance of the race who, in the "Vader-land," had successfully struggled for freedom from the moral tyranny of Rome, and political subjection to Spain—who had scooped their territory out of the sands of the sea, and sheltering themselves within vast dykes and embankments, from the ceaseless besieging of the German Ocean, had framed a commonwealth which long bade defiance to every power in Europe—whose very nature seemed to delight in conquering difficulties, and who in North and South America,§ China, Japan, Java, and other parts of the globe, manifested such extraordinary energy, enterprise, and judgment.

But while rendering due praise to the Dutch nation, for their bravery and ability during this, the brightest era of their history, the radical errors of their system of colonization cannot be overlooked, more particularly as by them were sown the seeds of the strife which now distracts one of the most important and valuable possessions of the British Crown, and imposes a heavy tax on the public exchequer. The Dutch, it is true, intended, at the outset, to form, not a colony, but simply a Residency of sufficient strength to ensure a place of refuge, where the annual fleet dispatched by them to India, varying in amount from 3,000 to between 5,000 and 6,000 men, should be supplied with fresh meat and vegetables, to the exclusion of the vessels of other, but especially of hostile powers. It was, however, not the less incumbent upon them, if only for the sake of saving their own people much risk and suffering, to have dispatched a small preliminary expedition,

* *Vide Record*, pp. 15, 16. Whether these fugitives were sailors or convicts, or in what manner they were bound to the company, does not appear; probably they were runaway sailors.

† Sir Francis Drake sailed from Plymouth, 15th November, 1573, on a voyage round the world. His fleet consisted of the *Hind*, 100 tons; *Elizabeth*, 80; *Marygold*, 30; *Swan*, 50; and a pinnace of 15 tons. On his homeward voyage in June, 1579, Drake doubled the Cape of Good Hope, and it is noted in

the account of his voyage, that "the few obstructions here met with, fully convinced him that the Portuguese had grossly misrepresented the passage [as the Dutch did after them], and abused the world with false representations of the horrors and dangers with which it is attended."—*Collection of Curious Voyages and Travels*, 4th edition, 1790. Vol. iii. p. 163.

§ New York and Demerara.

accompanied by some person who, like Janz or Prout, should have lived some time on friendly terms with the natives, with power to treat for the purchase of the requisite land and cattle, and explain the friendly intentions of his countrymen in coming among them. As for the far graver wrong of professing earnest zeal for the diffusion of religion among barbarous tribes, and yet taking no means of instructing them in its doctrines; but, on the contrary, making its very name odious in their ears, by being associated with the covetousness and oppression of its nominal disciples—that is an offence which the Supreme Ruler of every nation and every tribe under heaven, never yet suffered to pass unpunished. Nor was it only with regard to the aborigines, that the home authorities showed themselves indifferent, not to say hypocritical, in this important respect; for, disregarding the urgent solicitations of the commander and council, no clergyman was sent out for many years, and the people, meanwhile, were dependant on the casual and rare visits of ministers proceeding to or from India. Yet, notwithstanding the dearth of spiritual instruction and exhortation, a reverent sense of dependance seems to have been maintained among the settlers during their early trials. The council, when first assembled, was opened with prayer for a blessing upon its deliberations; the anniversary of the foundation of the settlement was commemorated by divine worship, and the delivery of the colonists from starvation, by the arrival of provisions from Holland and India, furnished occasion for humble and solemn thanksgiving. To such extremities had they been reduced immediately before receiving these long expected supplies in April, 1654, as to have eaten an ourang-outang, “as large as a small calf, with hands and feet like those of a man, long legs and arms, very hairy, and of a dark grey colour,” which had been found dead on Table Mountain.

Among other causes of their distress, was the theft of nearly the whole of their cattle, forty-four in number, by the natives, and the great mortality which took place among their sheep. The cattle were car-

ried off one Sunday, while the Dutch were assembled for divine service, and the boy left in charge of them was murdered. The theft was believed to have been committed by a party led by Herry, a Hottentot who had been acting as interpreter, and who had previously made a voyage to Bantam in an English ship. Whether this was or was not the commencement of cattle-stealing—the head and front of the offending on the part of the natives, from that time to the present, it is impossible to tell; but in Van Riebeeck’s journal it is spoken of as unprovoked. Even if it were so, his own statements prove, that before this or any other disturbances, beyond sundry small thefts on either side, had taken place, he had already suggested to the directors, that in the event of being unable to obtain cattle by friendly trade, it would be easy, with 150 men, to seize 10,000 or 11,000 cattle, and take prisoners of many savages, in order to send them as slaves to India, *as they still constantly come to us without weapons.* (December, 1652.) It is probable that no immediate aggression prompted the robbery,* as it appears from subsequent records, that having at first believed the Dutch to have come only as visitors, the aborigines became seriously alarmed when they beheld them building, sowing seeds, and gradually occupying the best pastures and springs, to the exclusion of their cattle. Then, knowing that their own subsistence depended mainly on the produce of their flocks and herds, (curdled milk being the chief article of food) they thought, by depriving the intruders of this resource, to compel them to quit the country. The Dutch, being the weaker party, dissembled their wrath, and resolved to bide their time. An entry in Van Riebeeck’s journal clearly illustrates the feelings of either party; avowed dislike and suspicion, on the one side—deadly hatred, concealed by treacherous professions, on the other. He states that his people had been forbidden by the Hottentots to cut wood and pluck grass; he adds, “they become the longer the more insolent, and we must, one time or other, show our teeth; but we ought to wait until they are hereabouts

* The people before spoken of as coming from Saldanha Bay, to whom, as also to the “Caepmans” and “Strandloopers” the Dutch thought fit to attribute the guilt of the robbery, were previously mentioned as scrupulously honest, so much so that when, after selling an animal, it strayed away, they would

voluntarily restore the piece of copper for which it was purchased, reclaiming it only on bringing back the same beast. They were besides at enmity with the “Caepmans” and “Strandloopers,” that is, with the people of whose territory the Dutch had taken possession.

with a thousand cattle, feeding meanwhile more and more their confidence in us, so as thereby to procure a better opportunity, not only for proper revenge for christian blood, but for a full indemnity for our stolen cattle."—(July, 1654.)

With regard to the unfortunate natives themselves, Van Riebeeck strongly urges the manifold advantages to be obtained by reducing them to slavery; and on another occasion, when describing the seeming kindness and forbearance with which they were being treated, he writes, "this, however, we only do to make them less shy, so as to find hereafter a better opportunity to seize them with all their cattle, 1,100 or 1,200 in number, and about 600 sheep, the best in the whole country. We have every day the finest opportunities for effecting this without bloodshed, and could derive good service from the people in chains, in killing seals or in labouring in the silver mines, which we trust will be found here." Instead of at once indignantly rejecting this infamous scheme, the company informed Van Riebeeck, that with regard to his proposal, in order to be rid of the "Cacpmans" (inhabitants of or dwellers at the Cape), "to keep them as slaves, to send some to Batavia, to employ some in killing seals, and others to fetch wood in charge," they thought fit to order him to "wait a little longer," before resorting to such extreme remedies. Subsequently, however, and after receiving the reports of various commissioners, the directors expressed in forcible language their decided disapproval of Van Riebeeck's views respecting the natives, declaring that their refusal to trade was not a sufficient reason for taking their property from them by force. In reply to this and other communications to the same effect, Van Riebeeck vindicated the policy he so frequently suggests—that of extracting from the natives the *amende profitable*, and of rendering the punishment of those who were deemed to "have deserved it," subservient to "the desired extension of the cultivation."*

The forbearance and simulated forgiveness of injuries practised by the Dutch, so greatly allayed the fears and suspicions of the Africans, as to induce them to recommence a friendly intercourse. Herry (the interpreter) came to the fort, bringing with him, in token of good will, about forty fine cattle for sale, and protested his innocence

of any share in the previous theft, declaring that on hearing of it, he had fled for fear of being punished on suspicion. Van Riebeeck pretended to believe him, and employed him in bartering with strange tribes for cattle, allowing him a small commission; reserving his vengeance for a more convenient opportunity. This occurred about three years after, when Herry's services being no longer required, it was resolved to seize him, and to capture, at the same time, the whole of the live stock belonging to him and his tribe. The treacherous manner in which this project was effected, is thus described by the commander and council, in a despatch to the Chamber, at Amsterdam, dated March, 1659:—

"Herry then [at the time chosen for taking him] lay with his camp about half an hour's walk from the fort, at Salt River, with a good herd of sheep and cattle (believing himself still in our best graces), and he suffered himself to be enticed by fair words into the commander's office, when, upon the 3rd of July following [about a week afterwards] the order was given to Sergeant Jan van Harwarden, to surround Herry's camp with a party of soldiers, with concealed weapons, and then to fetch all the stock, great and small, to the fort; which was easily carried into execution by him in sight of Herry (who was standing the while with us upon the *Cat*), but not without danger to the sergeant's life from some bold Hottentots, who opposed him with assegays, and one of whom he killed, wounding also two or three others, who, with the aid of some more Hottentots, several times repossessed themselves of the cattle; but he as often overtook them on horseback, and besides those wounded, as before stated, shot one, and at last brought all the live stock to the fort, being 110 very fine cattle, and 250 tolerably good sheep, which fully repays us for the stolen cattle, and for the merchandise entrusted to Herry; while, at the same time, by the killing and wounding of the said Hottentots, the murder of the Dutch boy is partially revenged, but not punished."

Poor Herry, and three or four of his companions, who were suspected of having been concerned in the robbery (five years before) were sent to the convict establishment at Robben Island, but he being "old and unfit for work," could not be made very serviceable. His niece, Eva, who had lived from the first coming of the Dutch in the family of Van Riebeeck, pleaded for him "like Esther for her uncle Mordecai,"† but not with a like result. Herry, however, and another Hottentot, succeeded, about a twelvemonth after, in making their escape to the main land in a small two-oared boat.

These proceedings greatly alarmed the natives, and Van Riebeeck took advantage

* See *Record*, pp. 50, 140, 155.

† See Van Riebeeck's Journal, *Record*, p. 141.

of their terror, to compel them to agree to a so-called treaty, by which they bound themselves to furnish a large quantity of cattle and sheep, in return for brass and tobacco, although well aware that the stipulated quota was much above what they could afford to part with. He exultingly informed his "honourable masters" that the savages were now so far brought into subjection, that none of them durst think of doing the slightest harm to any European, or venture near the fort with their cattle, "apparently out of fear that we may one day serve them *a la Herry*."* The directors, however, did not take the same view of the matter; they foresaw, at least to some extent, the evils which resulted from this step. To the colonists it taught the fatal lesson of the advantage to be gained by a system of reprisals, while it proved to the aborigines, that the white man could conceal revenge and covetousness for years under the fairest seeming. The results soon became manifest, and other circumstances combined to fan the flame of mutual distrust into unqualified aversion.

Shortly after the formation of the Cape residency, the Dutch East India Company, hoping to diminish its expenses, had issued orders to Van Riebeeck to offer freedom to such of their servants as would accept it, and to grant in freehold to each man as much land as he might desire for gardens, and that untaxed for the three first years, to be subject subsequently to such burdens as might be deemed suitable.

As a further inducement, their wives and children were to be sent out to them on condition of their binding themselves to remain not less than fourteen years at the Cape. At first, no one applied for freedom, being deterred by the numerous restrictions imposed by the company, such as not being

* See Van Riebeeck's Journal, *Record*, p. 157.

† The first "cargo" was brought from Guinea, in 1658; 228 arrived at the Cape, but no less than forty-three had perished on the passage. Never, perhaps, was there less want of slave labour. The Hottentots needed only careful and patient training to render them capable of far better service than even the Guinea slaves, and would unquestionably have given it at a very cheap rate; but it was the policy of the commander and council to treat them as, and thus probably render them, utterly debased and brutalised. Mr. (afterwards Sir John) Barrow, in his admirable work on the Cape, makes some very forcible remarks on this subject:—"Having first held out the irresistible charm that spirituous liquors and tobacco are found to possess amongst people in a rude state of society, they took the advantage of exchanging those pernicious poisons for the only means the natives enjoyed
